

Multiple Power Source Invented for All-Electric Cars - Designed by InventHelp Client (RDC-2505)

InventHelp, based in Pennsylvania, is submitting the RELAY AUTO BATTERY SYSTEM to companies for their review.

PITTSBURGH, PA ([PRWEB](#)) December 18, 2015 -- Anyone who has experienced the annoyance and lost time associated with a dead car battery will appreciate the creative thinking of an inventor from Henderson, S.C. Because of his idea, owners of all-electric cars will no longer have that problem.

He developed RELAY AUTO BATTERY SYSTEM to provide all-electric automobiles with a backup power source. It, thus, eliminates the possibility of a motorist being stranded because of a dead car battery. As a result, it improves highway safety by reducing the number of stalled vehicles on the road. Furthermore, it eliminates the need to wait for help with a dead battery on a busy road or in bad weather. Besides that, it saves lost time and avoids the frustration associated with a dead battery. It also improves the appeal of all-electric cars resulting in reduction of fuel consumption. In addition, it is convenient, effective and user friendly.

The inventor's personal experience inspired the idea. "After being taken by surprise by a dead car battery, I started to think about how I could avoid the inconvenience and potential danger of such a situation in the case of all-electric car," he said.

The original design was submitted to the Durham office of InventHelp. It is currently available for licensing or sale to manufacturers or marketers.
