

REVOLUTION IN ROAD SAFETY

A new set of systems which will help in dramatically reducing the damage caused by road accidents.

([PRWEB](#)) December 28, 2002 -- It is no doubt painful to note that at least 1 person dies every 30 seconds & 1 person is seriously injured every three second; Over US\$ 2 billions are lost daily all over the world due to vehicular accidents.

Don't these statements frighten you? If they do, then don't worry. A husband and wife team of qualified medical practitioners have devised a system after years of research which can reduce the damage caused to vehicles and death and injuries to passenger and pedestrians in vehicular accidents by over 75%.

The technology developed by them will greatly reduce auto-insurance expenses which in turn will drastically reduce life insurance premium.

Besides avoiding the personal , physical and physiological trauma to those directly involved in and also those who are associated with the people involved in road accidents this technology is invaluable, considering that death due to road accidents have assumed endemic proportion , said one of the medical practitioners involved in these set of systems.

Efforts are being made by this husband and wife team to invite charitable, philanthropy, social and community organisations besides research centers, scientists and policy making individuals at all levels , so that these set of system can be brought into practical and day to day use at the earliest .
