

FREE fuel for your car! Run Your Car on Water! Convert your car to Water Power. Fight back against the high costs of gasoline.

Run your car on water. The HydroStar is a Simplistic Affordable and Powerful Hydrogen Fuel System that can be constructed for your car or any vehicle. An Incredibly Affordable System That Provides FREE Energy. The HydroStarÂ can power your engine with the incredible energy of hydrogen, nature's perfect fuel. It's more powerful than gas, but it's trapped in every drop of water. And only the HydroStarÂ can efficiently free hydrogen's potent energy!

([PRWEB](#)) June 19, 2004 -- FREE fuel for your car! Run Your Car on Water! Convert your car to hydropower.

Fight back against the high costs of gasoline.

Construct a Simplistic Affordable and Powerful Water powered fuel system for your car or any vehicle.

An incredibly affordable system that provides FREE energy.

The HydroStarÂ can power your engine with the incredible energy of hydrogen, nature's perfect fuel.

It's more powerful than gas, but it's trapped in every drop of water and only the HydroStarÂ can efficiently free water's potent energy!

The HydroStarÂ is unique, nothing else compares to it.

It's compact, inexpensive, relatively easy to assemble and totally reliable. But the actual idea of using water is over a century old, it goes back to the very first engine. It was a great idea, but nobody could figure out how to turn the concept into reality - until now!

The HydroStarÂ runs on Water!

Practical fuel cell vehicles are still several years down the road and they will be very expensive at least until they are mass produced.

But mass production will only happen if the idea of using fuel cells catches on in the first place, But there's an easy and exciting way out of this dilemma:

The HydroStarÂ Conversion

The HydroStarÂ is a conversion system, that means you don't have to add, replace or modify any part of your existing vehicle.

You can always switch back to inefficient gasoline power in the unlikely event that the HydroStarÂ ever fails.

Fabulous Performance

The first thing you'll notice with the HydroStarÂ is an increase in power. Hydro power yields greater energy than gas, so it stands to reason that you should expect more pep. But, the biggest payoff is in increased MPGs.

The HydroStar is theoretically capable of delivering over 50 MPG.

But, as with any gasoline powered vehicle, actual MPGs will depend on various factors such as terrain, driving habits, vehicle weight & shape and ability to tweak the system. But, best of all, great performance happens as the results of using water - a virtually FREE and inexhaustible fuel source.

Easy-to-find Parts:

Not only is the HydroStarÂ relatively simple, but its parts are easily available at all building supply stores.

And, being only about 10" long, it's compact enough to fit under the hood of almost any vehicle. Location isn't critical - you can even mount it in the trunk.

The HydroStar's Water Reservoir can be made from any old large can or jar to do the job, but a 5 to 10 gallon gas can is perfect.

HyTronics

No high cost or exotic electronic parts are used in the HydroStarÂ.

You can find everything at a local Radio Shack, Circuits-R-Us or DigiKey. Or buy from any one of dozens of mail order suppliers.

Environmentally Friendly

The original concept for the HydroStarÂ was conceived by a small group of scientists, engineers and inventors in Canada.

They were determined to do something meaningful about their deteriorating environment, but couldn't obtain any real help or funding from government sources. So they decided they themselves would do something about it. The HydroStarÂ is one result, but one very important result of their personal funding and efforts.

If you're also concerned about our environment, as we all should be, the HydroStarÂ certainly shines there. Not only does it use an inexhaustible resource (water), but it actually helps clean pollution from the air we breathe. That's right, as you drive it pulls in atmospheric air (with all it's pollutants) and burns it. Its only exhaust byproduct is water - clean water! For further details, visit the website.
