Coast Guard, DHS

§ 453.7

has been brought into compliance. Upon giving such notice, the owner, or his agent, may return the container to service.

[45 FR 37217, June 2, 1980]

§ 453.7 Appeal provisions.

(a) The owner, his agent, or the custodian of a container subject to a detention order or other order, may petition the Chief, Office of Operating and Environmental Standards (G-MSO), U.S. Coast Guard to review that order.

(b) The Chief, Office of Operating and Environmental Standards (G-MSO), U.S. Coast Guard requires independent surveys to determine the extent of deficiencies, if necessary. Upon completion of his review, including review of the results of any required independent surveys, the Chief, Office of Operating and Environmental Standards (G-MSO), U.S. Coast Guard affirms, sets aside, or modifies the order.

(c) The owner of a container is liable for any costs incident to a petition for review including any independent surveys, and for any other costs incident to or resulting from detention or other control of a container.

(d) Unless otherwise determined by the Chief, Office of Operating and Environmental Standards (G-MSO), U.S. Coast Guard, a detention order or other order remains in effect pending the outcome of any petition or appeal of that order.

(e) The Chief, Office of Operating and Environmental Standards (G-MSO), U.S. Coast Guard acts on all appeals within ten days of receipt.

PART 501—ORGANIZATION AND DELEGATION OF POWERS AND DUTIES

Sec. 501.1 Purpose.
501.2 General.
501.3 Organization and general responsibilities.
501.4 Succession to Administrator.
501.5 Exercise of authority.
501.6 Secretary's reservations of authority.
501.7 Administrator's reservations of authority.
501.8 Delegations.

SOURCE: 53 FR 26258, July 12, 1988, unless otherwise noted.

§ 501.1 Purpose.

This part describes the organization of the National Highway Traffic Safety Administration (NHTSA) through Associate Administrator, Regional Administrator and Staff Office Director levels and provides for the performance of duties imposed on, and the exercise of powers vested in, the Administrator of the NHTSA (hereafter referred to as the “Administrator”).

§ 501.2 General.

The Administrator is delegated authority by the Secretary of Transportation (49 CFR 1.50) to:

(a) Carry out the following chapters or sections of Title 49 of the United States Code:

(1) Chapter 301—Motor Vehicle Safety.

(2) Chapter 303—National Driver Register.

(3) Chapter 305—National Automobile Title Information System.

(4) Chapter 321—General.

(5) Chapter 323—Consumer Information.

(6) Chapter 325—Bumper Standards.

(7) Chapter 327—Odometers.

(8) Chapter 329—Automobile Fuel Economy.

(9) Chapter 331—Theft Prevention.

(10) Section 20134(a), with respect to the laws administered by the National Highway Traffic Safety Administrator pertaining to highway, traffic and motor vehicle safety.

(b) Carry out 23 U.S.C. chapter 4, HIGHWAY SAFETY, as amended, except for section 409 and activities relating to highway design, construction and maintenance, traffic control devices, identification and surveillance of accident locations, and highway-related aspects of pedestrian and bicycle safety.

(c) Exercise the authority vested in the Secretary by section 210(2) of the Clean Air Act, as amended (42 U.S.C. 7544(2)).

(d) Carry out the Act of July 14, 1960, as amended (23 U.S.C. 313 note).

(e) Administer the following sections of Title 23, United States Code, with the concurrence of the Federal Highway Administrator:

(1) Section 141, as it relates to certification of the enforcement of speed limits.

(2) Section 153.

(3) Section 154(a), (b), (d), and (e).

(4) Section 158.

(f) Carry out the consultation functions vested in the Secretary by Executive Order 11912 (3 CFR, 1976 Comp., p. 114), as amended.

[60 FR 43029, Aug. 18, 1995]

§ 501.3 Organization and general responsibilities.

The National Highway Traffic Safety Administration consists of a headquarters organization located in Washington, DC, and a unified field organization consisting of ten geographic regions. The organization of, and general spheres of responsibility within, the NHTSA are as follows:

(a) Office of the Administrator—(1) Administrator. (i) Represents the Department and is the principal advisor to the Secretary in all matters related to chapters 301, 303, 305, 321, 323, 325, 327, 329, and 331 of Title 49 U.S.C.; 23 U.S.C. chapter 4, except section 409; as each relates to highway safety, sections 141, 153, 154(a), (b), (d) and (e), and 158 of Title 23 U.S.C.; and such other authorities as are delegated by the Secretary of Transportation (49 CFR 1.50):

(ii) Establishes NHTSA program policies, objectives, and priorities and directs development of action plans to accomplish the NHTSA mission;

(iii) Directs, controls, and evaluates the organization, program activities,
§ 501.4 Succession to Administrator.

(a) The following officials, in the order indicated, shall act in accordance with the requirements of 5 U.S.C. 3346–3349 as Administrator of the National Highway Traffic Safety Administration, in the case of the absence or disability or in the case of a vacancy in the office of the Administrator, until a successor is appointed:

(b) Chief Counsel. As chief legal officer, provides legal services for the Administrator and the Administration; prepares litigation for the Administration; effects rulemaking actions; issues subpoenas; and serves as coordinator on legislative affairs.

(c) Senior Associate Administrators—(1) Senior Associate Administrator for Policy and Operations. As the principal advisor to the Administrator and Deputy Administrator with regard to core administrative and support services, provides direction and internal management and mission support for such activities. Provides executive direction over the Associate Administrator for Advanced Research and Analysis, the Associate Administrator for Administration, the Associate Administrator for Planning, Evaluation and Budget, the Chief Information Officer and the Office of Communications and Consumer Information.

(2) Senior Associate Administrator for Vehicle Safety. As the principal advisor to the Administrator and Deputy Administrator with regard to rulemaking, enforcement and applied research, provides direction and internal management and mission support for such activities. Provides executive direction over the Associate Administrator for Rulemaking, the Associate Administrator for Enforcement, and the Associate Administrator for Applied Research.

(3) Senior Associate Administrator for Traffic Injury Control. As the principal advisor to the Administrator and Deputy Administrator with regard to programs to reduce traffic injury, provides direction and internal management and mission support for such activities. Provides executive direction over the Associate Administrator for Program Development and Delivery and the Associate Administrator for Injury Control Operations and Resources.

(4) Deputy Administrator. Assists the Administrator in discharging responsibilities. Directs and coordinates the Administration’s management and operational programs, and related policies and procedures at headquarters and in the field. Provides policy direction and executive direction to the Associate Administrator for State and Community Services.

(5) Director, Executive Secretariat. Provides a central facilitative staff that administers an executive correspondence program and maintains policy files for the Administrator and Deputy Administrator, and services and support to committees as designated by the Administrator.

(6) Director, Office of Civil Rights. As principal staff advisor to the Administrator and Deputy Administrator on all matters pertaining to civil rights, acts as Director of Equal Employment Opportunity, Contracts Compliance Officer and Title VI (Civil Rights Act of 1964) Coordinator; assures Administration-wide compliance with related laws, Executive Orders, regulations and policies; and provides assistance to the Office of the Secretary in investigating and adjudicating formal complaints of discrimination.

(7) Director, Intergovernmental Affairs. As the principal advisor to the Administrator and Deputy Administrator on all intergovernmental matters, including communications with Congress, communicates agency policy and coordinates with the Chief Counsel on legislative issues affecting the agency.
(1) Deputy Administrator;  
(2) Chief Counsel;  
(3) Senior Associate Administrator for Vehicle Safety;  
(4) Senior Associate Administrator for Traffic Injury Control; and  
(5) Senior Associate Administrator for Policy and Operations.

(b) In order to qualify for the line of succession, officials must be encumbered in their position on a permanent basis.

[69 FR 63957, Nov. 3, 2004]

§ 501.5 Exercise of authority.

(a) All authorities lawfully vested in the Administrator and reserved to him/her in this Regulation or other NHTSA directives may be exercised by the Deputy Administrator and, in the absence of both Officials, by the Executive Director, unless specifically prohibited.  
(b) In exercising the powers and performing the duties delegated by this part, officers of the NHTSA and their delegates are governed by applicable laws, executive orders, regulations, and other directives, and by policies, objectives, plans, standards, procedures, and limitations as may be issued from time to time by or on behalf of the Secretary of Transportation, the Administrator, Deputy Administrator and Executive Director or, with respect to matters under their jurisdictions, by or on behalf of the Associate Administrators, Regional Administrators, and Directors of Staff Offices.

(c) Each officer to whom authority is delegated by this part may redelegate and authorize successive redelegations of that authority subject to any conditions the officer prescribes. Redelegations of authority shall be in written form and shall be published in the Federal Register when they affect the public.  
(d) Each officer to whom authority is delegated will administer and perform the functions described in the officer’s respective functional statements.

[53 FR 26258, July 12, 1988, as amended at 58 FR 12545, Mar. 5, 1993]

§ 501.6 Secretary’s reservations of authority.

The authorities reserved to the Secretary of Transportation are set forth in subpart 1.44 of part 1 and in part 95 of the regulations of the Office of the Secretary of Transportation in subtitle A of this title (49 CFR parts 1 and 95).

§ 501.7 Administrator’s reservations of authority.

The delegations of authority in this part do not extend to the following authority which is reserved to the Administrator and, in those instances when the office of the Administrator is vacant due to death or resignation, or when the Administrator is absent as provided by §501.5(a), to the Deputy Administrator or Executive Director:

(a) The authority under chapter 301—Motor Vehicle Safety—of Title 49 of the United States Code to:  
(1) Issue, amend, or revoke final federal motor vehicle safety standards and regulations;  
(2) Make final decisions concerning alleged safety-related defects and noncompliances with Federal motor vehicle safety standards;  
(3) Grant or renew temporary exemptions from federal motor vehicle safety standards; and  
(4) Grant or deny appeals from determinations upon petitions for inconsequential defect or noncompliance.  
(b) The authority under 23 U.S.C. chapter 4, as amended, to:  
(1) Apportion authorization amounts and distribute obligation limitations for State and community highway safety programs under 23 U.S.C. 402;  
(2) Approve the initial awarding of alcohol incentive grants to the States authorized under 23 U.S.C. 408, and drunk driving prevention grants to the States authorized under 23 U.S.C. 410;  
(3) Issue, amend, or revoke uniform State and community highway safety guidelines, and, with the concurrence of the Federal Highway Administrator, designate priority highway safety programs, under 23 U.S.C. 402;  
(4) Fix the rate of compensation for non-government members of agency sponsored committees which are entitled to compensation.  
(c) The authority under chapters 321, 323, 325, and 329 of Title 49 of the United States Code to:  
(1) Issue, amend, or revoke final rules and regulations, except for final rules issued under section 32902(d); and
§ 501.8 Delegations.

(a) Deputy Administrator. The Deputy Administrator is delegated authority to act for the Administrator, except where specifically limited by law, order, regulation, or instructions of the Administrator. The Deputy Administrator is delegated authority to provide executive direction to the Associate Administrator for State and Community Services and the Director of International Harmonization, and assist the Administrator in providing executive direction to all organizational elements of NHTSA.

(b) [Reserved]

(c) Director, Office of Civil Rights. The Director, Office of Civil Rights is delegated authority to:

(1) Act as the NHTSA Director of Equal Employment Opportunity.

(2) Act as NHTSA Contracts Compliance Officer.

(3) Act as NHTSA coordinator for matters under Title VI of the Civil Rights Act of 1964 (42 U.S.C. 2000d et seq.), Executive Order 12250 (3 CFR, 1980 Comp., p. 298), and regulations of the Department of Justice.

(d) Chief Counsel. The Chief Counsel is delegated authority to:

(1) Exercise the powers and perform the duties of the Administrator with respect to setting of odometer regulations authorized under 49 U.S.C. chapter 327, and with respect to providing technical assistance and granting extensions of time to the states under 49 U.S.C. 32705.

(2) Establish the legal sufficiency of all investigations conducted under the authority of the following chapters of Title 49 of the United States Code: chapter 301; chapter 323; chapter 325; chapter 327; chapter 328; and chapter 331, and to compromise any civil penalty or monetary settlement in an amount of $25,000 or less resulting from a violation of any of these chapters.

(3) Exercise the powers of the Administrator under 49 U.S.C. 30166 (c), (g), (h), (i), and (k).

(4) Issue subpoenas, after notice to the Administrator, for the attendance of witnesses and production of documents pursuant to chapters 301, 323, 325, 327, 329, and 331 of Title 49 of the United States Code.

(5) Issue authoritative interpretations of the statutes administered by NHTSA and the regulations issued by the agency.

(e) Senior Associate Administrator for Policy and Operations. The Senior Associate Administrator for Policy and Operations is delegated authority for executive direction of the Associate Administrator for Advanced Research and Analysis; the Associate Administrator for Administration; the Associate Administrator for Planning, Evaluation, and Budget; the Chief Information Officer; and the Director of Communications and Consumer Information. To carry out this direction, the Senior Associate Administrator for Policy and Operations is delegated authority, except for authority reserved to the Administrator, to direct the NHTSA planning and evaluation system in conjunction with Departmental requirement and planning goals; to coordinate the development of the Administrator’s plans, policies, budget, and programs, and analyses of their expected impact, and their evaluation in terms of the degree of goal achievement; and to perform independent analyses of proposed Administration regulatory, grant, legislative, and program activities. Except for authority reserved to the Senior Associate Administrator for Vehicle Safety, the Senior Associate Administrator for Policy and Operations is delegated authority to develop and conduct research and development programs and projects necessary to support the purposes of Chapters 301, 323, 325, 327, 329, and 331 of Title 49, United States Code, and Chapter 4 of Title 23, United States Code, as amended, in coordination with the Senior Associate Administrator.
Administrator for Vehicle Safety and the Chief Counsel. The Senior Associate Administrator for Policy and Operations is also delegated authority to exercise procurement authority with respect to NHTSA requirements; administer and conduct NHTSA’s personnel management activities; administer NHTSA financial management programs, including systems of funds control and accounts of all financial transactions; and conduct administrative management services in support of NHTSA missions and programs.

(f) Senior Associate Administrator for Vehicle Safety. The Senior Associate Administrator for Vehicle Safety is delegated authority for executive direction of the Associate Administrator for Rulemaking, the Associate Administrator for Enforcement and the Associate Administrator for Applied Research. The Senior Associate Administrator for Vehicle Safety exercises executive direction with respect to the setting of standards and regulations for motor vehicle safety, fuel economy, theft prevention, consumer information, and odometer fraud. To carry out this direction, the Senior Associate Administrator for Vehicle Safety is delegated authority, except for authority reserved to the Administrator or the Chief Counsel, to exercise the powers and perform the duties of the Administrator with respect to the setting of motor vehicle safety and theft prevention standards, average fuel economy standards, procedural regulations, and the development of consumer information and odometer fraud regulations authorized under Chapters 301, 323, 325, 327, 329, and 331 of title 49, United States Code. Except for authority reserved to the Senior Associate Administrator for Policy and Operations, the Senior Associate Administrator for Vehicle Safety is delegated authority to develop and conduct research and development programs and projects necessary to support the purposes of Chapters 301, 323, 325, 327, 329, and 331 of title 49, United States Code, and Chapter 4 of title 23, United States Code, as amended, in coordination with the appropriate Associate Administrators, and the Chief Counsel. The Senior Associate Administrator for Vehicle Safety is also delegated authority to respond to a manufacturer’s petition for exemption from 49 U.S.C. Chapter 301’s notification and remedy requirements in connection with a defect or non-compliance concerning labeling errors; extend comment periods (both self-initiated and in response to a petition for extension of time) for noncontroversial rulemakings; make technical amendments or corrections to a final rule; extend the effective date of a non-controversial final rule; administer the NHTSA enforcement program for all laws, standards, and regulations pertinent to vehicle safety, fuel economy, theft prevention, damageability, consumer information and odometer fraud, authorized under Chapters 301, 323, 325, 327, 329, and 331 of title 49, United States Code; issue regulations relating to the importation of motor vehicles under sections 30141 through 30147 of title 49, United States Code; and grant and deny petitions for import eligibility determinations submitted to NHTSA by motor vehicle manufacturers and registered importers under 49 U.S.C. 30141.

(g) Senior Associate Administrator for Traffic Injury Control. The Senior Associate Administrator for Traffic Injury Control is delegated authority for executive direction of the Associate Administrator for Program Development and Delivery and the Associate Administrator for Injury Control Operations and Resources. To carry out this direction, the Senior Associate Administrator for Traffic Injury Control is delegated authority, except for authority reserved to the Administrator, over programs with respect to: Chapter 4 of title 23, United States Code, as amended; the authority vested by section 210(2) of the Clean Air Act, as amended (42 U.S.C. 7544(2)); the authority vested by 49 U.S.C. 20134(a), with respect to the laws administered by the Administrator pertaining to highway, traffic, and motor vehicle safety; the Act of July 14, 1960, as amended (23 U.S.C. 313 note) and 49 U.S.C. Chapter 303; the authority vested by section 157(g) of title 23, United States Code; the authority vested by sections 153, 154, 157(except paragraph (g)), 161, 163, and 164 of title
23. United States Code, with the concurrence of the Federal Highway Administrator; and section 209 of the Surface Transportation Assistance Act of 1978 (23 U.S.C. 401 note) as delegated by the Secretary in §501.2(i). The Senior Associate Administrator for Traffic Injury Control is also delegated authority to exercise the powers and perform the duties of the Administrator with respect to State and community highway safety programs under 23 U.S.C. 402, including approval and disapproval of State highway safety plans and final vouchers, in accordance with the procedural requirements of the Administration; to approve the awarding of alcohol incentive grants to the States under 23 U.S.C. 408 and drunk driving prevention grants under 23 U.S.C. 410, for years subsequent to the initial awarding of such grants by the Administrator; as appropriate for activities benefiting states and communities; and to implement 23 U.S.C. 403.

(h) Director, Office of Vehicle Safety Compliance, Enforcement. The Director, Office of Vehicle Safety Compliance, Enforcement, is delegated authority to execute the powers and perform the duties of the Administrator with respect to granting and denying petitions for import eligibility decisions submitted to NHTSA by motor vehicle manufacturers and registered importers under 49 U.S.C. 30141(a)(1).

PART 509—OMB CONTROL NUMBERS FOR INFORMATION COLLECTION REQUIREMENTS

Sec. 509.1 Purpose.  
509.2 Display.  

AUTHORITY: 49 U.S.C. 3507.

§509.1 Purpose.  

This part collects and displays the control numbers assigned to information collection requirements of NHTSA by the Office of Management and Budget (OMB). NHTSA intends that this part comply with the requirements of 44 U.S.C. 3507(d), which mandates that agencies display a current control number assigned by the Director of the OMB for each agency information collection requirement.

PART 510—INFORMATION GATHERING POWERS

Sec. 510.1 Scope and purpose.  
510.2 Definitions.  
510.3 Compulsory process, the service thereof, claims for confidential treatment, and terms of compliance.  
510.4 Subpoenas, generally.  
510.5 Information gathering hearings.  
510.6 Administrative depositions.  
510.7 General or special orders.  
510.8 Written requests for the production of documents and things.  
510.9 Motions to modify, limit, or quash process.
§ 510.3 Compulsory process, the service thereof, claims for confidential treatment, and terms of compliance.

(a) NHTSA may use any of the following means to conduct investigations, inspections, or inquiries to obtain information to carry out its functions under the National Traffic and Motor Vehicle Safety Act of 1966, as amended, 15 U.S.C. 1381 et seq., and the Motor Vehicle Information and Cost Savings Act, as amended, 15 U.S.C. 1901 et seq.:

(1) Subpoenas;
(2) Information gathering hearings;
(3) Administrative depositions;
(4) General or special orders; and
(5) Written requests for the production of documents and things.

(b) A person, sole proprietorship, partnership, corporation, or other entity served with compulsory process under this part shall be provided with the following information at the time of the service:

(1) The name of the person, sole proprietorship, partnership, corporation, or other entity to which the process is addressed;
(2) The statutory provision under which the compulsory process is issued;
(3) The date, time, and place of return;
(4) A brief statement of the subject matter of the investigation, inspection, or inquiry; and
(5) In the case of a subpoena duces tecum or a written request for the production of documents and things, a reasonably specific description of the documents or things to be produced.

(c) Service of the compulsory processes specified in paragraph (a) of this section is effected:

(1) By personal service upon the person, agent-in-charge, or agent designated to receive process under 15 U.S.C. 1399(e) of the sole proprietorship, partnership, corporation or other entity being investigated, inspected, or inquired of; or
(2) By mail (registered or certified) or delivery to the last known residence or business address of such person or agent.

(d) The date of service of any compulsory process specified in paragraph (a) of this section is the date on which the process is mailed by the agency, or delivered in person, as the case may be. Whenever a period is prescribed for compliance with compulsory process, and the process is served upon the party by mail, 3 days are added to the period.

(e) (1) Any person, sole proprietorship, partnership, corporation, or other entity submitting information or producing documents or things in response to any compulsory process issued under this part may request confidential
§ 510.4 Subpoenas, generally.

NHTSA may issue to any person, sole proprietorship, partnership, corporation, or other entity a subpoena requiring the production of documents or things (subpoena duces tecum) and testimony of witnesses (subpoena ad testificandum), or both, relating to any matter under investigation or the subject of any inquiry. Subpoenas are issued by the Chief Counsel. When a person, sole proprietorship, partnership, corporation, or other entity is served with a subpoena ad testificandum under this part, the subpoena will describe with reasonable particularity the matters on which the testimony is required. In response to a subpoena ad testificandum, the sole proprietorship, partnership, corporation, or other entity so named shall designate one or more officers, directors, or managing agents, or other persons who consent to testify on its behalf, and set forth, for each person designated, the matters on which he or she will testify. The persons so designated shall testify as to matters known or reasonably available to the entity.

[53 FR 36261, July 12, 1988]

§ 510.5 Information gathering hearings.

(a) NHTSA may issue a subpoena to compel any person, sole proprietorship, partnership, corporation, or other entity to provide information at an information gathering hearing. The subpoenas are used for the purpose of obtaining testimony from a witness under oath and obtaining relevant documents and things. The Administrator, or a NHTSA employee designated by the Administrator, presides at the hearing. Information gathering hearings are open to the public unless the presiding officer rules otherwise, and the hearings are stenographically reported.

(b) In addition to the presiding officer, one or more other persons may comprise the panel. Each member of the panel may question any witness at the hearing. No person who is not a member of the panel may ask questions of a witness. However, any person may submit to the panel, in writing, proposed questions to be asked of a witness. A member of the panel may pose these questions to the witness if that member deems the questions useful and appropriate. Proposed questions may be submitted to the panel at any time before or during the course of the hearing.

(c) The stenographic record of each witness’s testimony will be available to the public, unless the testimony was not given publicly and the witness requests confidential treatment for some or all of his or her testimony. When an oral request for confidential treatment is made during the course of a witness’s testimony, the presiding officer may order the hearing closed to the public at that point and continue the questioning of the witness, or may note the request for confidentiality and direct the witness not to answer the question at that time, but require the witness to answer the question in writing within some specified period, or take such other action as the presiding
§ 510.6 Administrative depositions.

(a) NHTSA may issue a subpoena to compel any person, sole proprietorship, partnership, corporation, or other entity to provide information as a witness at an administrative deposition. These depositions are for the purpose of obtaining information from the witness under oath and receiving documents and things relevant to an agency investigation. These depositions shall be taken before an officer authorized to administer oaths by the laws of the United States or of the place where the deposition is taken. Unless otherwise ordered by the Administrator, administrative depositions are closed to the public.

(b) Any person who is required by subpoena or designated by an entity that is required by subpoena to produce documents or things or to give testimony as a witness at an administrative deposition may be accompanied, represented, and advised by counsel. Any member of the bar of a Federal court or the courts of any State or Territory of the United States, the Commonwealth of Puerto Rico, or the District of Columbia, and any representative, official, or employee of the sole proprietorship, partnership, corporation, or other entity under subpoena may act as counsel.

(c) During an administrative deposition:

(1) The presiding officer before whom the deposition is to be taken puts the witness on oath and personally, or by someone acting under his or her direction and in his or her presence, records the testimony of the witness. The testimony is stenographically reported.

(2) After NHTSA has examined the witness at the deposition, that witness’ counsel or representative may examine the witness. NHTSA may then reexamine the witness’ counsel or representative may reexamine
the witness and so forth, as appropriate.

(3) A witness appearing in response to a subpoena may confer in confidence with his or her counsel or representative concerning any questions asked of the witness. If such witness, counsel, or representative objects to a question, he or she shall state the objection and the basis therefor on the record.

(4) Objections to the qualifications of the officer taking the deposition, or to the manner of taking it, or to the evidence presented, and any other objection to the proceedings shall be noted by the officer on the record, and shall be treated as continuing. Evidence objected to shall be taken subject to the objections. Errors and irregularities occurring at a deposition in the manner of the taking of the deposition, in the form of questions or answers, or in the oath or affirmation, and errors of any kind which might be obviated, removed, or cured if promptly presented shall be deemed to be waived unless reasonable objection is made thereto at the taking of the deposition.

(5) If the witness refuses to answer any question or answers evasively, or if the witness or his or her counsel engages in conduct likely to delay or obstruct the administrative deposition, such refusal, evasive answer or conduct shall be a failure to comply with the subpoena issued to the witness.

(6) Upon completion of the examination of a witness, the witness may clarify on the record any of his or her answers.

(d) The transcript of the testimony of a witness who testified in response to a subpoena at an administrative deposition is submitted to the witness for signature, unless the witness waives the right to sign the transcript. If a witness desires to make any changes in the form or substance contained in the transcript, the witness shall submit, together with the transcript, a separate document setting forth the changes and stating the reasons for such changes. If the deposition is not signed by the witness within 30 days of its submission to the witness, or such other period as the NHTSA may designate, the officer before whom the deposition was taken or a NHTSA employee signs the transcript and states on the record the fact of the waiver of the right to sign or the fact of the witness’ unavailability or inability or refusal to sign together with the reasons, if any, given therefor.

(e) The transcript of the testimony of a witness will be inspected by NHTSA to determine if there are any errors in the transcription of the questions posed to the witness and the testimony in response to those questions. If NHTSA discovers any errors, it notes that fact and forwards the notation of errors together with the transcript to the witness, requesting the witness to stipulate that the transcript is in error and that the corrections made by NHTSA are accurate. If the witness will not make this stipulation, NHTSA may make a motion to the presiding officer to include its notation of error and its corrections in the record along with the version of the testimony signed by the witness.

(f)(1) Upon payment of lawfully prescribed costs, any person who is required by subpoena or designated by a sole proprietorship, partnership, corporation, or other entity that is required by subpoena to appear as a witness at an administrative deposition may procure a copy of the deposition as recorded, except that in a nonpublic investigatory proceeding, the witness may, for good cause, be limited to an inspection of the record of the deposition.

(2) A copy of the record of the deposition may be furnished to the witness without charge or at a reduced charge if the Associate Administrator for Administration determines that waiver of the fee is in the public interest because furnishing the copy can be considered as primarily benefitting the general public. Any witness who seeks a waiver of the copying charge may apply in writing to the Associate Administrator for Administration, and shall state the reasons justifying waiver of the fee in the application.

(g) The testimony obtained in an administrative deposition may be used or considered by the NHTSA in any of its activities, and may be used or offered into evidence in any administrative proceeding in accordance with the provisions of 5 U.S.C. 554, or in any judicial proceeding.
§ 510.7 General or special orders.

The NHTSA may require by the issuance of general or special orders any person, sole proprietorship, partnership, corporation, or other entity to file with the NHTSA, in such form as NHTSA may prescribe, periodic or special reports or answers in writing to specific questions. The responses to general or special orders will provide NHTSA with such information as it may require, including, but not limited to, information relating to the organization of that person, sole proprietorship, partnership, corporation, or other entity, its business, conduct, practices, management, and relation to any other person or entity. General or special orders which are required to be answered under oath are issued by the Chief Counsel. Any general or special order issued under this section contains the information specified in §510.3(b). Reports and answers filed in response to general or special orders must be made under oath, or otherwise, as NHTSA may prescribe.

§ 510.8 Written requests for the production of documents and things.

The NHTSA may, by the issuance of a written request for the production of documents and things, require any person, sole proprietorship, partnership, corporation, or other entity to produce documents or things. A written request for the production of documents and things may be issued alone, or as a part of a general or special order issued under §510.7. Written requests for the production of documents and things are issued by the Chief Counsel. Any written request for the production of documents and things issued under this section shall contain the information specified in §510.3(b).

§ 510.9 Motions to modify, limit, or quash process.

(a)(1) Any person, sole proprietorship, partnership, corporation, or other entity served with a subpoena issued under §510.4 may file with the Deputy Administrator a motion to modify, limit, or quash that subpoena. If there is no Deputy Administrator, or the Deputy Administrator is not available, such motions shall be filed with and decided by the Associate Administrator for Administration. A motion to modify, limit, or quash must be filed not later than 15 days after the service of the process or five days before the return date specified in the process, whichever is earlier, except that, if the process is served within five days of its return date, such motion may be filed at any time before the return date. Any motion must set forth the grounds and theories of why and how the party believes the process should be modified, limited, or quashed and must contain all facts and arguments which support those grounds and theories.

(2) The Deputy Administrator may, upon receiving a motion filed pursuant to paragraph (a)(1) of this section:

(i) Deny the motion;
(ii) Modify the return date of the subpoena;
(iii) Modify, limit or quash the subpoena;
(iv) Condition granting the motion upon certain requirements; or
(v) Take any other action he or she believes to be appropriate in the circumstances.

(3) The Office of the Deputy Administrator serves the decision on the motion to modify, limit, or quash, filed under paragraph (a) of this section.

(b) The Deputy Administrator’s decision on the motion to modify, limit, or quash, filed under paragraph (a) of this section is not subject to reconsideration by NHTSA.

§ 510.10 Supplementation of responses to process.

(a) A person, sole proprietorship, partnership, corporation, or other entity which has provided NHTSA with information under this part, which information was complete and accurate at the time the information was given to NHTSA, is not required to supplement
§ 510.11 Fees.

Any person compelled to appear in person in response to a subpoena issued under this part at an information gathering hearing or an administrative deposition is paid the same attendance and mileage fees as are paid witnesses in the courts of the United States, in accordance with title 28, U.S.C., section 1821.

§ 510.12 Remedies for failure to comply with compulsory process.

Any failure to comply with compulsory process authorized by law and issued under this part is a violation of this part. In the event of such failure to comply, NHTSA may take appropriate action pursuant to the authority conferred by the National Traffic and Motor Vehicle Safety Act or the Motor Vehicle Information and Cost Savings Act, as appropriate, including institution of judicial proceedings to enforce the order and to collect civil penalties.

PART 511—ADJUDICATIVE PROCEDURES

Subpart A—Scope of Rules; Nature of Adjudicative Proceedings, Definitions

Sec.
511.1 Scope of the rules.
511.2 Nature of adjudicative proceedings.
511.3 Definitions.

§ 511.78 Prohibited communications.

Appendix I to Part 511—Final Prehearing Order

Source: 45 FR 81578, Dec. 11, 1980, unless otherwise noted.

Subpart A—Scope of Rules; Nature of Adjudicative Proceedings, Definitions

§ 511.1 Scope of the rules.

This part establishes rules of practice and procedure for adjudicative proceedings conducted pursuant to section 508(a)(2) of the Motor Vehicle Information and Cost Savings Act (15 U.S.C. Pub. L. 94–163, 89 Stat. 911, section 2008(a)(2)), which are required by statute to be determined on the record after opportunity for a public hearing.

§ 511.2 Nature of adjudicative proceedings.

Adjudicative proceedings shall be conducted in accordance with title 5, U.S.C., sections 551 through 559 and this part. It is the policy of the agency that adjudicative proceedings shall be conducted expeditiously and with due regard to the rights and interests of all persons affected, and to the public interest. Therefore, the presiding officer and all parties shall make every effort at each stage of a proceeding to avoid unnecessary delay.

§ 511.3 Definitions.

(a) As used in this part:
(1) The term application means an ex parte request by a party for an order that may be granted or denied without opportunity for response by any other party.
(2) The term NHTSA means the National Highway Traffic Safety Administration.
(3) The term Administrator means the Administrator of the National Highway Traffic Safety Administration.
(4) The term Complaint Counsel means prosecuting counsel for the NHTSA.
(5) The term motion means a request by a party for a ruling or order that may be granted or denied only after opportunity for response by each affected party.
(6) The term party means the NHTSA and any person named as a respondent in a proceeding governed by this part.
(7) The term person means any individual, partnership, corporation, association, public or private organization, or Federal, State or municipal governmental entity.
(8) The term petition means a written request, made by a person or a party and addressed to the Presiding Officer or the Administrator, that the addressee take some action.

(9) The term Presiding Officer means the person who conducts an adjudicative hearing under this part, who shall be an administrative law judge qualified under title 5, U.S.C., section 3105 and assigned by the Chief Administrative Law Judge, Office of Hearings, United States Department of Transportation.

(10) The term Respondent means any person against whom a complaint has been issued.

(11) The term Office of Hearings means the Office of Hearings, Department of Transportation.

(12) The term staff means the staff of the National Highway Traffic Safety Administration.

(13) The term Chief Administrative Law Judge means the Chief Administrative Law Judge of the Office of Hearings, Department of Transportation.

(14) The term Docket Section means the Docket Section, Office of the Secretary of Transportation.

Subpart B—Pleadings; Form; Execution; Service of Documents

§ 511.11 Commencement of proceedings.

(a) Notice of institution of an enforcement proceeding. An adjudicative proceeding under this part is commenced by the issuance of a complaint by the NHTSA.

(b) Form and content of complaint. The complaint shall be signed by the Complaint Counsel and shall contain the following:

(1) Recital of the legal authority for instituting the proceeding, with specific designation of the statutory provisions involved in each allegation.

(2) Identification of each respondent.

(3) A clear and concise statement of the charges, sufficient to inform each respondent with reasonable definiteness of the factual basis of the allegations of violation. A list and summary of documentary evidence supporting the charges shall be attached.

(4) A statement of the civil penalty which the Complaint Counsel believes is in the public interest, or which is required by law. In the case of civil penalties assessed for violations of section 507(3) of the Motor Vehicle Information and Cost Savings Act (15 U.S.C. 2007(3)), the amount of such penalty shall be calculated from the time of the alleged violation. In the case of civil penalties assessed for violations of section 507(1) or (2) of that Act, any monetary credits available to offset those civil penalties shall be specified.

(5) The right of the respondent to a hearing on the alleged violations.

(c) Notice to the public. Once a complaint is issued, notice of it shall be immediately submitted to the Federal Register for publication. The notice in the Federal Register shall briefly describe the nature of the proceeding and state that petitions to participate in the proceeding must be filed no later than the first prehearing conference.

§ 511.12 Answer.

(a) Time for filing. A respondent shall have twenty (20) days after service of a complaint within which to file an answer.

(b) Content of answer. An answer shall conform to the following:

(1) Request for hearing. Respondent shall state whether it requests a full, adjudicatory hearing or whether it desires to proceed on the basis of written submissions. If a hearing is requested, respondent shall specify those issues on which a hearing is desired.

(2) Contested allegations. An answer in which the allegations of a complaint are contested shall contain:

(i) Specific admission or denial of each allegation in the complaint. If the respondent is without knowledge or information sufficient to form a belief as to the truth of an allegation, respondent shall so state. Such a statement shall have the effect of a denial. Denials shall fairly meet the substance of the allegations denied. Allegations not thus answered shall be deemed to have been admitted.

(ii) A concise statement of the factual and/or legal defenses to each allegation of the complaint.

(3) Admitted allegations. If the respondent admits or fails to deny any
factual allegation, he or she shall be deemed to have waived a hearing as to such allegation.

(c) Default. Failure of the respondent to file an answer within the time provided (or within an extended time, if provided), shall be deemed to constitute a waiver of the right to appear and contest the allegations set forth in the complaint and to authorize the Presiding Officer to make such findings of fact as are reasonable under the circumstances.

§ 511.13 Amendments and supplemental pleadings.
Whenever determination of a controversy on the merits will be facilitated thereby, the Presiding Officer upon motion, may allow appropriate amendments and supplemental pleadings which do not unduly broaden the issues in the proceeding or cause undue delay.

§ 511.14 Form and filing of documents.
(a) Filing. Except as otherwise provided, all documents submitted to the Administrator or a Presiding Officer shall be filed with the Docket Section, Office of the Secretary, Department of Transportation, Room 4107, 400 Seventh Street, SW., Washington, DC 20590. Documents may be filed in person or by mail and shall be deemed filed on the day of filing or mailing.

(b) Caption. Every document shall contain a caption setting forth the name of the action in connection with which it is filed, the docket number, and the title of the document.

(c) Copies. An original and nine (9) copies of all documents shall be filed. Documents may be reproduced by printing or any other process, provided that all copies filed are clear and legible.

(d) Signature. (1) The original of each document filed shall be signed by a representative of record for the party; or in the case of parties not represented, by the party; or by a partner, officer, or regular employee of any corporation, partnership, or association, who files an appearance on behalf of the party.

(2) The act of signing a document constitutes a representation by the signer that the signer has read it; that to the best of the signer’s knowledge, information and belief, the statements made in it are true; and that it is not filed for purposes of delay.

§ 511.15 Time.
(a) Computation. In computing any period of time prescribed or allowed by the rules in this part, the day of the act, event, or default from which the designated period of time begins to run shall not be included. The last day of the period so computed shall be included, unless it is a Saturday, a Sunday, or a legal holiday, in which event the period runs until the end of the next day which is not a Saturday, a Sunday, or a legal holiday. When the period of time prescribed or allowed is less than 7 days, intermediate Saturdays, Sundays, and legal holidays shall be excluded in the computation. As used in this part, “legal holiday” includes New Year’s Day, Washington’s Birthday, Memorial Day, Independence Day, Labor Day, Columbus Day, Veteran’s Day, Thanksgiving Day, Christmas Day, and any other day appointed as a holiday by the President or the Congress of the United States.

(b) Additional time after service by mail. Whenever a party is required or permitted to do an act within a prescribed period after service of a document and the document is served by mail, three (3) days shall be added to the prescribed period.

(c) Extensions. For good cause shown, the Presiding Officer may extend any time limit prescribed or allowed under this part or by order of the Administrator or the Presiding Officer, except those governing the filing of interlocutory appeals and appeals from Initial Decisions and those expressly requiring the Administrator’s action. Except as otherwise provided by law, the Administrator, for good cause shown, may extend any time limit prescribed under this part, or by order of the Administrator or the Presiding Officer. A party or participant may petition the Presiding Officer or the Administrator, as appropriate, for an extension under this paragraph. Such a petition shall be filed prior to the occurrence of the
§ 511.16  Service.

(a) Mandatory service. Every document filed with the Office of Hearings shall be served upon all parties and participants to a proceeding, i.e., Complaint Counsel, respondent(s), and participants, and upon the Presiding Officer.

(b) Service of complaint, ruling, order, decision, or subpoena. Service of a complaint, ruling, order, decision, or subpoena may be effected as follows:

(1) By registered or certified mail. A copy of the document shall be addressed to the person, partnership, corporation or unincorporated association to be served at his or its residence or principal office or place of business; registered or certified; and mailed; or

(2) By delivery to an individual. A copy of the document may be delivered to the person to be served; or to a member of the partnership to be served; or to the president, secretary, or other executive officer, or a director of the corporation or unincorporated association to be served; or to an agent authorized by appointment or by law to receive service; or

(3) By delivery to an address. A copy of the document may be left at the principal office or place of business of the person, partnership, corporation, unincorporated association, or authorized agent with an officer, a managing or general agent; or it may be left with a person of suitable age and discretion residing therein, at the residence of the person or of a member of the partnership or of an executive officer, director, or agent of the corporation or unincorporated association to be served.

(c) Service of documents with prescribed response periods. When service of a document starts the running of a prescribed period of time for the submission of a responsive document or the occurrence of an event, the document shall be served as provided in paragraph (b) of this section.

(d) Service of other documents. All documents other than those specified in paragraph (c) of this section may be served as provided in paragraph (b) of this section, or by ordinary first-class mail, properly addressed, postage prepaid.

(e) Service on a representative. When a party has appeared by an attorney or other representative, service upon that attorney or other representative shall constitute service on the party.

(f) Certificate of service. The original of every document filed with the agency and required to be served upon all parties to a proceeding shall be accompanied by a certificate of service signed by the party making service, stating that such service has been made upon each party to the proceeding. Certificates of service may be in substantially the following form:

I hereby certify that I have this day served the foregoing document upon all parties of record in this proceeding by mailing, postage prepaid (or by delivering in person) a copy to each such party.

Dated at ______________ this ___ day of __________, 19__.

(Signature) ______________

For ______________

(g) Date of service. The date of service of a document shall be the date on which the document is deposited in the United States mail or is delivered in person.

§ 511.17  Public participation.

Participant Status. Any person interested in a proceeding commenced pursuant to §511.11 who desires to participate in the proceeding, shall file with the Docket Section a notice of intention to participate in the proceeding and shall serve a copy of such notice on each party to the proceeding. A notice of intention to participate shall be filed not later than the commencement of the hearing. Untimely filings will not be accepted absent a determination by the Presiding Officer that the person making the request has made a substantial showing of good cause for failure to file on time. Any person who files a notice to participate in the proceeding as a nonparty shall be known as a “participant” and shall have the rights specified in §511.41(d).

[53 FR 15783, May 3, 1988]
§ 511.18 Joinder of proceedings.

Two or more matters which have been scheduled for adjudicative proceedings, and which involve one or more common questions of law or fact, may be consolidated for the purpose of hearing, appeal or the Administrator’s review. A motion for consolidation for the purpose of hearing may be filed with the Presiding Officer by any party to such proceedings not later than thirty (30) days prior to the hearing. A motion for consolidation for the purpose of appeal may be filed by any party to such proceedings within 10 days after issuance of the Initial Decision. A motion to consolidate shall be served upon all parties to all proceedings whose joinder is contemplated. The proceedings may be consolidated where to do so would tend to avoid unnecessary costs or delay. Such consolidation may also be ordered upon the initiative of the Presiding Officer or the Administrator, as appropriate. The Presiding Officer may order separate hearings on any issue where to do so would promote economy or convenience or would avoid prejudice to a party.

Subpart C—Prehearing Procedures; Motions; Interlocutory Appeals; Summary Judgment; Settlement

§ 511.21 Prehearing conferences.

(a) When held. (1) A prehearing conference shall be held in person or by conference telephone call, except in unusual circumstances, approximately fifty (50) days after publication in the FEDERAL REGISTER of the complaint, upon ten (10) days notice to all parties and participants, to consider any or all the following:

(i) Motions for consolidation of proceedings;

(ii) Identification, simplification and clarification of the issues;

(iii) Necessity or desirability of amending the pleadings;

(iv) Stipulations and admissions of fact and of the content and authenticity of documents;

(v) Oppositions to notices of oral examination;

(vi) Motions for protective orders to limit or modify discovery;

(vii) Issuance of subpoenas to compel the appearance of witnesses and the production of documents;

(viii) Limitation of the number of witnesses, particularly the avoidance of duplicate expert witnesses;

(ix) Matters of which official notice will be taken and matters which may be resolved by reliance upon findings of other Federal agencies; and

(x) Other matters which may expedite the conduct of the hearing.

§ 511.22 Prehearing briefs.

Not later ten (10) days prior to the hearing, the parties shall, except when ordered otherwise by the Presiding Officer in unusual circumstances, simultaneously serve and file prehearing briefs, which shall set forth:

(a) a statement of the facts expected to be proved, and of the anticipated order of proof;

(b) a statement of the issues and the legal argument in support of the party’s contentions with respect to each issue; and

(c) a table of authorities with a designation by asterisk of the principal authorities relied upon.

§ 511.23 Motions.

(a) Presentations and dispositions. During the time a proceeding is before a Presiding Officer, all motions, whether oral or written, except those filed under § 511.42(e), shall be addressed to the Presiding Officer, who shall rule upon them promptly after affording an opportunity for response.

(b) Written motions. All written motions shall state the particular order, ruling, or action desired and the grounds therefor. If a motion is supported by memoranda, affidavits or other documents, they shall be served and filed with the motion. All motions shall contain a proposed order setting forth the relief sought. All written motions shall be filed with the Executive Secretary and served on all parties, and all motions addressed to the Administrator shall be in writing.

(c) Responses. Within ten (10) days after service of any written motion or petition or within such longer or shorter time as may be designated by these Rules or by the Presiding Officer or the Administrator, the opposing party or parties shall file a written response to
such motion. Where a motion would affect only a single party, or an identifiable group of parties, the Presiding Officer or Administrator may limit the response to the motion to the affected party or parties. Failure to respond to a written motion may, in the discretion of the Presiding Officer be deemed as consent to the granting of the relief sought in the motion. The moving party shall have no right to reply, except as permitted by the Presiding Officer or the Administrator.

(d) Rulings on motions for dismissal. When a motion to dismiss a complaint or motion for other relief is granted with the result that the proceeding before the Presiding Officer is terminated, the Presiding Officer shall issue an Initial Decision and Order thereon in accordance with the provisions of §511.51. If such a motion is granted as to all issues alleged in the complaint, or is granted as to any part of the allegations in regard to any or all of the respondents, the Presiding Officer shall enter an order on the record and consider the remaining issues in the Initial Decision. The Presiding Officer may elect to defer ruling on a motion to dismiss until the close of the case.

§511.24 Interlocutory appeals.

(a) General. Rulings of the Presiding Officer may not be appealed to the Administrator prior to the Initial Decision, except as provided herein.

(b) Exceptions—(1) Interlocutory appeals to Administrator. The Administrator may, in his or her discretion, entertain interlocutory appeals where a ruling of the Presiding Officer:

(i) Requires the production or disclosure of records claimed to be confidential;

(ii) Requires the testimony of a supervisory official of the agency other than one especially cognizant of the facts of the matter in adjudication;

(iii) Excludes an attorney from participation in a proceeding pursuant to §511.42(b).

(2) Procedures for interlocutory appeals. Within ten (10) days of issuance of a ruling, any party may petition the Administrator to entertain an interlocutory appeal on a ruling in the categories enumerated above. The petition shall not exceed fifteen (15) pages. Any other party may file a response to the petition within ten (10) days of its service. The response shall not exceed fifteen (15) pages. The Administrator shall thereupon act upon the petition, or the Administrator shall request such further briefing or oral presentation as he may deem necessary.

(3) Interlocutory appeals from all other rulings—(1) Grounds. Interlocutory appeals from all other rulings by the Presiding Officer may proceed only upon motion to the Presiding Officer and a determination by the Presiding Officer in writing, with justification in support thereof, that the ruling involves a controlling question of law or policy as to which there is substantial ground for differences of opinion and that an immediate appeal from the ruling may materially advance the ultimate termination of the litigation, or that subsequent review will be an inadequate remedy.

(ii) Form. If the Presiding Officer determines, in accordance with paragraph (b)(3)(i) of this section that an interlocutory appeal may proceed, a petition for interlocutory appeal may be filed with and acted upon by the Administrator in accordance with paragraph (b)(2) of this section.

(c) Proceedings not stayed. A petition for interlocutory appeal under this part shall not stay the proceedings before the Presiding Officer unless the Presiding Officer shall so order, except that a ruling of the Presiding Officer requiring the production of records claimed to be confidential shall be automatically stayed for a period of (10) days following the issuance of such ruling to allow an affected party the opportunity to file a petition for an interlocutory appeal pursuant to §511.24(b)(2). The filing of such a petition shall automatically extend the stay of such a ruling pending the Administrator’s action on such petition.

§511.25 Summary decision and order.

(a) Motion. Any party may move, with a supporting memorandum, for a Summary Decision and Order in its favor upon all or any of the issues in controversy. Complaint Counsel may so move at any time after thirty (30)
days following issuance of a complaint, and any other party may so move at any time after issuance of a complaint. Any such motion by any party shall be filed at least twenty (20) days before the date fixed for the adjudicatory hearing.

(b) **Response to motion.** Any other party may, within ten (10) days after service of the motion, file a response thereto with a supporting memorandum.

(c) **Grounds.** A Summary Decision and Order shall be granted if the pleadings and any testimony upon oral examination, answers to interrogatories, admissions, and/or affidavits show that there is no genuine issue as to any material fact and that the moving party is entitled to a Summary Decision and Order as a matter of law.

(d) **Legal effect.** A Summary Decision and Order upon all the issues being adjudicated shall constitute the Initial Decision of the Presiding Officer, and may be appealed to the Administrator in accordance with §511.53. A Summary Decision, interlocutory in character, may be rendered on fewer than all issues and may not be appealed prior to issuance of the Initial Decision, except in accordance with §511.24.

(e) **Case not fully adjudicated on motion.** A Summary Decision and Order that does not dispose of the whole case shall include a statement of those material facts as to which there is no substantial controversy, and of those material facts that are actually and in good faith controverted. The Summary Order shall direct such further proceedings as are just.

§511.26 **Settlement.**

(a) **Applicability.** This section applies only to cases of alleged violations of section 507(3) of the Motor Vehicle Information and Cost Savings Act, Pub. L. 94–163, 89 Stat. 911 (15 U.S.C. section 2007(3)). Settlement in other cases may be made only in accordance with subpart G of this part.

(b) **Availability.** Any party shall have the opportunity to submit an offer of settlement to the Presiding Officer.

(c) **Form.** Offers of settlement shall be in the form of a consent agreement and order, shall be signed by the party submitting the offer or his representative, and may be signed by any other party. Each offer of settlement shall be accompanied by a motion to transmit to the Administrator the proposed agreement and order, outlining the substantive provisions of the agreement, and the reasons why it should be accepted.

(d) **Contents.** The proposed consent agreement and order which constitute the offer of settlement shall contain the following:

1. An admission of all jurisdictional facts;
2. An express waiver of further procedural steps, and of all rights to seek judicial review or otherwise to contest the validity of the order;
3. A description of the alleged non-compliance, or violation;
4. Provisions to the effect that the allegations of the complaint are resolved by the proposed consent agreement and order;
5. A listing of the acts or practices from which the respondent shall refrain;
6. A detailed statement of the corrective action(s) which the respondent shall execute and the civil penalty, if any, that respondent shall pay.

(e) **Transmittal.** The Presiding Officer shall transmit to the Administrator for decision all offers of settlement and accompanying memoranda that meet the requirements enumerated in paragraph (d) of this section. The Presiding Officer may, but need not, recommend acceptance or rejection of such offers. Any party or participant may object to a proposed consent agreement by filing a motion and supporting memorandum with the Administrator.

(f) **Stay of proceedings.** When an offer of settlement has been agreed to by the parties and has been transmitted to the Administrator, the proceedings shall be stayed until the Administrator has ruled on the offer. When an offer of settlement has been made and transmitted to the Administrator but has not been agreed to by all parties, the proceedings shall not be stayed pending the Administrator’s decision on the offer.

(g) **Administrator’s ruling.** The Administrator will rule upon all transmitted
§ 511.31 General provisions governing discovery

(a) Applicability. The discovery rules established in this subpart are applicable to the discovery of information among the parties to a proceeding. Parties seeking information from persons not parties may do so by subpoena in accordance with §511.38.

(b) Discovery methods. Parties may obtain discovery by one or more of the following methods: (1) Written interrogatories; (2) requests for production of documents or things; (3) requests for admissions; or (4) testimony upon oral examination. Unless the Presiding Officer otherwise orders under paragraph (d) of this section, the frequency of use of these methods is not limited.

(c) Scope of discovery. The scope of discovery is as follows:

(1) In general. Parties may obtain discovery regarding any matter not privileged, which is relevant to the subject matter involved in the proceedings, whether it relates to the claim or defense of the party seeking discovery or to the claim or defense of any other party. It is not ground for objection that the information sought will be inadmissible at the hearing if the information sought appears reasonably calculated to lead to the discovery of admissible evidence.

(2) Exception. Parties may not obtain discovery of documents which accompanied the staff’s recommendation as to whether a complaint should issue or of documents or portions thereof which would be exempt from discovery under Rule 26(b)(3) of the Federal Rules of Civil Procedure.

(3) Hearing preparation: Experts. A party may obtain discovery of facts known and opinions held by experts, regardless of whether they are acquired or developed in anticipation of or for litigation. Such discovery may be had by any of the methods provided in paragraph (b) of this section.

(d) Protective orders. Upon motion by a party or person and for good cause shown, the Presiding Officer may make any order which justice requires to protect such party or person from annoyance, embarrassment, competitive disadvantage, oppression or undue burden or expense, including one or more of the following: (1) That the discovery shall not be had; (2) that the discovery may be had only on specified terms and conditions, including a designation of the time and/or place; (3) that the discovery shall be had only by a method of discovery other than that selected by the party seeking discovery; (4) that certain matters shall not be inquired into, or that the scope of discovery shall be limited to certain matters; (5) that discovery shall be conducted with no one present except persons designated by the Presiding Officer; (6) that a trade secret or other confidential research, development, or commercial information shall not be disclosed or shall be disclosed only in a designated way or only to designated parties; and (7) that responses to discovery shall be placed in camera in accordance with §511.45.

If a motion for a protective order is denied in whole or in part, the Presiding Officer may, on such terms or conditions as are just, order that any party provide or permit discovery.
§ 511.33  Production of documents and things.

(a) Scope. Any party may serve upon any other party a request (1) to produce and permit the party making
§ 511.34 Requests for admission.

(a) Procedure for request. A party may serve upon any other party a written request for the admission, for the purposes of the pending proceeding only, of the truth of any matters within the scope of § 511.31(c)(1) set forth in the request that relate to statements or opinions of fact or of the application of law to fact, including the genuineness of documents described in the request. Copies of documents shall be served with the request unless they have been, or are otherwise furnished or made available for inspection and copying. The request may, without leave of the Presiding Officer, be served upon any party after filing of the answer. Each matter as to which an admission is requested shall be separately set forth.

(b) Procedure for response. The matter as to which an admission is requested is deemed admitted unless within thirty (30) days after service of the request, or within such shorter or longer time as the Presiding Officer may allow, the party to whom the request is directed serves upon the party requesting the admission a written answer or objection addressed to the matter, signed by the party or the party’s representatives. If objection is made, the reasons therefore shall be stated. The answer shall specifically admit or deny the matter or set forth in detail the reasons why the answering party cannot truthfully admit or deny the matter. A denial shall fairly meet the substance of the requested admission. When good faith requires that a party qualify an answer or deny only a part of the matter as to which an admission is requested, the party shall specify the portion that is true and qualify or deny the remainder. An answering party may not give lack of information or knowledge as a reason for failure to admit or deny, unless the party states that he or she has made reasonable inquiry and that the information known or readily available to him or her is insufficient to enable him or her to admit or deny. A party who considers that a matter as to which an admission has been requested presents a genuine issue for hearing may not, on that ground alone, object to the request but may deny the matter or set forth reasons why the party cannot admit or deny it. The party who has requested an admission may move to determine the sufficiency of the answer or objection thereto in accordance with § 511.36. If the Presiding Officer determines that an answer does not comply with the requirements of this section, he or she may order that the matter be deemed admitted or that an amended answer be served.
(c) **Effect of admission.** Any matter admitted under this section is conclusively established unless the Presiding Officer on motion permits withdrawal or amendment of such admission. The Presiding Officer may permit withdrawal or amendment when the presentation of the merits of the action will be served thereby and the party that obtained the admission fails to satisfy the Presiding Officer that withdrawal or amendment will prejudice that party in maintaining an action or defense on the merits.

§ 511.35 **Testimony upon oral examination.**

(a) **When testimony may be taken.** At any time after the answer is filed under § 511.12, upon leave of the Presiding Officer and under such terms and conditions as the Presiding Officer may prescribe, any party may take the testimony of any other party, including the agents, employees, consultants or prospective witnesses of that party at a place convenient to the witness. The attendance of witnesses and the production of documents and things at the examination may be compelled by subpoena as provided in § 511.38.

(b) **Notice of oral examination—(1) Examination of a party.** A party desiring to examine another party to the proceeding shall, after obtaining leave from the Presiding Officer, serve written notice of the examination on all other parties and the Presiding Officer at least ten (10) days before the date of the examination. The notice shall state (i) the time and place for making the examination; (ii) the name and address of each person to be examined, if known, or if the name is not known, a general description sufficient to identify him; and (iii) the subject matter of the expected testimony. If a subpoena **duces tecum** is to be served on the person to be examined, the designation of the materials to be produced, as set forth in the subpoena, shall be attached to or included in the notice of examination.

(2) **Examination of a nonparty.** A party desiring to examine a person who is not a party to the proceeding shall make application for a subpoena, in accordance with § 511.38, to compel the attendance, testimony and/or production of documents by such person who is not a party. The party desiring such examination shall serve written notice of the examination on all other parties to the proceeding, after issuance of the subpoena by the Presiding Officer or a designated alternate.

(3) **Opposition to notice.** A person served with a notice of examination may, within 3 days of the date of service, oppose, in writing, the examination. The Presiding Officer shall rule on the notice and any opposition and may order the taking of all noticed examinations, upon a showing of good cause therefor. The Presiding Officer may, for good cause shown, enlarge or shorten the time for the taking of an examination.

(c) **Persons before whom examinations may be taken.** Examinations may be taken before any person authorized to administer oaths by the laws of the United States or of the place where the examination is held. No examination shall be taken before a person who is a relative or employee or attorney or representative of any party, or who is a relative or employee of such attorney or representative, or who is financially interested in the action.

(d) **Procedure—(1) Examination.** Each witness shall be duly sworn, and all testimony shall be duly recorded. All parties or their representatives may be present and participate in the examination. Examination and cross-examination of witnesses may proceed as permitted at the hearing. Questions objected to shall be answered subject to the objections. Objections shall be in short form, and shall state the grounds relied upon. The questions propounded and the answers thereto, together with all objections made, shall be recorded by the official reporter before whom the examination is made. The original or a verified copy of all documents and things produced for inspection during the examination of the witness shall, upon a request of any party present, be marked for identification and annexed to the record of the examination.

(2) **Motion to terminate or limit examination.** At any time during the examination, upon motion of any party or of the witness, and upon showing that the examination is being conducted in bad
faith or in such manner as unreasonably to annoy, embarrass or oppress the witness or party, the Presiding Officer may, upon motion, order the party conducting the examination to terminate the examination, or may limit the scope and manner of the examination as provided in §511.31(d).

(3) Participation by parties not present. In lieu of attending an examination, any party may serve written questions in a sealed envelope on the party conducting the examination. That party shall transmit the envelope to the official reporter, who shall unseal it and propound the questions contained therein to the witness.

(e) Transcription and filing of testimony—(1) Transcription. Upon request by any party, the testimony recorded at an examination shall be transcribed. When the testimony is fully transcribed, the transcript shall be submitted to the witness for examination and signing, and shall be read to or by the witness, unless such examination and signature are waived by the witness. Any change in form or substance which the witness desires to make shall be entered upon the transcript of the official reporter with a statement of the reasons given by the witness for making them. The transcript shall then be signed by the witness, unless the parties by stipulation waive the signing, or the witness is ill or cannot be found or refuses to sign. If the transcript is not signed by the witness within thirty (30) days of its submission to him, the official reporter shall sign it and state on the record the fact of the waiver of signature or of the illness or absence of the witness or the fact of the refusal to sign, together with a statement of the reasons therefor. The testimony may then be used as fully as though signed, in accordance with paragraph (i) of this section.

(2) Certification and filing. The official reporter shall certify on the transcript that the witness was duly sworn and that the transcript is a true record of the testimony given and corrections made by the witness. The official reporter shall then seal the transcript in an envelope endorsed with the title and docket number of the action and marked “Testimony of [name of witness]” and shall promptly file the transcript with the Docket Section. The Presiding Officer shall notify all parties of the filing of the transcript and the Docket Section shall furnish a copy of the transcript to any party or to the witness upon payment of reasonable charges therefor.

(f) Costs of examination. The party who notices the examination shall pay for the examination. The party who requests transcription of the examination shall pay for the transcription.

(g) Failure to attend or to serve subpoena; expenses. If a party who notices an examination fails to attend and proceed therewith and another party attends in person or by a representative pursuant to the notice, the Presiding Officer may order the party who gave the notice to pay the attending party the reasonable expenses incurred. If a party who notices an examination fails to serve a subpoena upon the witness and as a result the witness does not attend, and if another party attends in person or by a representative because that party expects the examination to be made, the Presiding Officer may order the party who gave notice to pay the attending party the reasonable expenses incurred.

(h) Examination to preserve testimony—(1) When available. By leave of the Presiding Officer, a party may examine a witness for the purpose of perpetuating the testimony of that witness. A party who wishes to conduct such an examination shall obtain prior leave of the Presiding Officer by filing a motion. The motion shall include a showing of substantial reason to believe that the testimony could not be presented at the hearing. If the Presiding Officer is satisfied that the perpetuation of the testimony may prevent a failure of justice or is otherwise reasonably necessary, he or she shall order that the deposition be taken.

(2) Procedure. Notice of an examination to preserve testimony shall be served at least fifteen (15) days prior to the examination. The examination shall be taken in accordance with the provisions of paragraph (d) of this section. Any examination taken to preserve testimony shall be fully transcribed and filed in accordance with paragraph (e) of this section.
§ 511.37 Sanctions for failure to comply with order.

If a party fails to obey an order to provide or permit discovery, the Presiding Officer may take such action as is just, including but not limited to the following:

(a) Infer that the admission, testimony, document, or other evidence would have been adverse to the party;

(b) Order that for the purposes of the proceeding, the matters regarding which the order was made or any other designated facts shall be taken to be established in accordance with the claim of the party obtaining the order;

(c) Order that the party withholding discovery not introduce into evidence or otherwise rely, in support of any claim or defense, upon the documents or other evidence withheld;

(d) Order that the party withholding discovery not introduce into evidence or otherwise use at the hearing, information obtained in discovery;

(e) Order that the party withholding discovery not be heard to object to introduction and use of secondary evidence to show what the withheld admission, testimony, documents, or other evidence would have shown;

(f) Order that a pleading, or part of a pleading, or a motion or other submission by the party, concerning which the order was issued, be stricken, or

§ 511.36 Motions to compel discovery.

If a party fails to respond to discovery, in whole or in part, the party seeking discovery may move within twenty (20) days for an order compelling an answer, or compelling inspection or production of documents, or otherwise compelling discovery. For purposes of this subsection, an evasive or incomplete response is to be treated as a failure to respond. If the motion is granted, the Presiding Officer shall issue an order compelling discovery. If the motion is denied in whole or in part, the Presiding Officer may make such protective order as he or she would have been empowered to make on a motion pursuant to §511.31(d). When making oral examinations, the discovering party shall continue the examination to the extent possible with respect to other areas of inquiry before moving to compel discovery.
§ 511.38 Subpoenas.

(a) Availability. A subpoena shall be addressed to any party or any person not a party for the purpose of compelling attendance, testimony and production of documents at a hearing or oral examination.

(b) Form. A subpoena shall identify the action with which it is connected; shall specify the person to whom it is addressed and the date, time and place for compliance with its provisions; and shall be issued by order of the Presiding Officer and signed by the Chief Counsel, or by the Presiding Officer. A subpoena duces tecum shall specify the books, papers, documents, or other materials or data compilations to be produced.

(c) How obtained—

(1) Content of application. An application for the issuance of a subpoena stating reasons shall be submitted in triplicate to the Presiding Officer.

(2) Procedure of application. The original and two copies of the subpoena, marked “original,” “duplicate” and “triplicate,” shall accompany the application. The Presiding Officer shall rule upon an application for a subpoena ex parte, by issuing the subpoena or by issuing an order denying the application.

(d) Issuance of a subpoena. The Presiding Officer shall issue a subpoena by signing and dating, or ordering the Chief Counsel to sign and date, each copy in the lower right-hand corner of the document. The “duplicate” and “triplicate” copies of the subpoena shall be transmitted to the applicant for service in accordance with these Rules; the “original” copy shall be retained by or forwarded to the Chief Counsel for retention in the docket of the proceeding.

(e) Service of a subpoena. A subpoena may be served in person or by certified mail, return receipt requested, as provided in §511.16(b). Service shall be made by delivery of the signed “duplicate” copy to the person named therein.

(f) Return of service. A person serving a subpoena shall promptly execute a return of service, stating the date, time, and manner of service. If service is effected by mail, the signed return receipt shall accompany the return of service. In case of failure to make service, a statement of the reasons for the failure shall be made. The “triplicate” of the subpoena, bearing or accompanied by the return of service, shall be returned forthwith to the Chief Counsel after service has been completed.

(g) Motion to quash or limit subpoena. Within five (5) days of receipt of a subpoena, the person against whom it is directed may file with the Presiding Officer a motion to quash, modify, or limit the subpoena, setting forth the reasons why the subpoena should be withdrawn or why it should be modified or limited in scope. Any such motion shall be answered within five (5) days of service, and shall be ruled on immediately thereafter. The order shall specify the date, if any, for compliance with the specifications of the subpoena and the reasons for the decision.

(h) Consequences of failure to comply. In the event of failure to comply with a subpoena, the Presiding Officer may take any of the actions enumerated in §511.37 or may order any other appropriate relief to compensate for the withheld testimony, documents, or other materials. If in the opinion of the Presiding Officer such relief is insufficient, the Presiding Officer shall certify to the Administrator a request for judicial enforcement of the subpoena.

(45 FR 81578, Dec. 11, 1980, as amended at 53 FR 26261, July 12, 1988)

§ 511.39 Orders requiring witnesses to testify or provide other information and granting immunity.

(a) A party who desires the issuance of an order requiring a witness to testify or provide other information upon being granted immunity from prosecution under title 18, U.S.C., section 6002, may make a motion to that effect. The motion shall be made and ruled on in accordance with §511.22, and shall include a showing:
(1) That the testimony or other information sought from a witness or prospective witness may be necessary to the public interest; and
(2) That such individual has refused or is likely to refuse to testify or provide such information on the basis of that individual's privilege against self-incrimination.

(b) If the Presiding Officer determines that the witness' testimony appears necessary and that the privilege against self-incrimination may be invoked, he or she may certify to the Administrator a request that he or she obtain the approval of the Attorney General of the United States for the issuance of an order granting immunity.

(c) Upon application to and approval of the Attorney General of the United States, and after the witness has invoked the privilege against self-incrimination, the Presiding Officer shall issue the order granting immunity unless he or she determines that the privilege was improperly invoked.

(d) Failure of a witness to testify after a grant of immunity or after a denial of the issuance of an order granting immunity shall result in the imposition of appropriate sanctions as provided in §511.37.

Subpart E—Hearings

§ 511.41 General rules.

(a) Public hearings. All hearings pursuant to this part shall be public unless otherwise ordered by the Presiding Officer. Notice of the time and location of the hearing shall be served on each party and participant, and published in the FEDERAL REGISTER.

(b) Expedition. Hearings shall proceed with all reasonable speed, insofar as practicable and with due regard to the convenience of the parties and shall continue without suspension until concluded, except in unusual circumstances.

(c) Rights of parties. Every party shall have the right of timely notice and all other rights essential to a fair hearing, including, but not limited to, the rights to present evidence, to conduct such cross-examination as may be necessary in the judgment of the Presiding Officer for a full and complete disclosure of the facts, and to be heard by objection, motion, brief, and argument.

(d) Rights of participants. Every participant shall have the right to make a written or oral statement of position, file proposed findings of fact, conclusions of law and a posthearing brief, in accordance with §511.17(b).

(e) Rights of witnesses. Any person compelled to testify in a proceeding in response to a subpoena may be accompanied, represented, and advised by counsel or other representative, and may obtain a transcript of his or her testimony at no cost.

§ 511.42 Powers and duties of Presiding Officer.

(a) General. A Presiding Officer shall have the duty to conduct full, fair, and impartial hearings, to take appropriate action to avoid unnecessary delay in the disposition of proceedings, and to maintain order. He or she shall have all powers necessary to that end, including the following powers:

(1) To administer oaths and affirmations;
(2) To compel discovery and to impose appropriate sanctions for failure to make discovery;
(3) To issue subpoenas;
(4) To rule upon offers of proof and receive relevant and probative evidence;
(5) To regulate the course of the hearings and the conduct of the parties and their representatives therein;
(6) To hold conferences for simplification of the issues, settlement of the proceedings, or any other proper purposes;
(7) To consider and rule, orally or in writing, upon all procedural and other motions appropriate in an adjudicative proceeding;
(8) To issue initial decisions, rulings, and orders, as appropriate;
(9) To certify questions to the Administrator for determination; and
(10) To take any action authorized in this part or in conformance with the provisions of title 5, U.S.C., sections 551 through 559.

(b) Exclusion of parties by Presiding Officer. A Presiding Officer shall have the authority, for good cause stated on the record, to exclude from participation in a proceeding any party, participant,
§ 511.43 Evidence.

(a) Applicability of Federal Rules of Evidence. The Federal Rules of Evidence shall apply to proceedings held under this part only as a general guide. The Presiding Officer may admit any relevant and probative evidence.

(b) Burden of proof. (1) Complaint counsel shall have the burden of sustaining the allegations of any complaint.

(2) Any party who is the proponent of a legal and/or factual proposition shall have the burden of sustaining the proposition.

(c) Presumptions. A presumption imposes on the party against whom it is directed the burden of going forward with evidence to rebut or meet the presumption, but does not shift to such party the burden of proof in the sense of the risk of nonpersuasion, which remains throughout the hearing upon the party on whom it was originally cast.

(d) Admissibility. All relevant and reliable evidence is admissible, but may be excluded if its probative value is substantially outweighed by unfair prejudice or by considerations of undue delay, waste of time, immateriality, or needless presentation of cumulative evidence.

(e) Official notice—(1) Definition. Official notice means use by the Presiding Officer of extra-record facts and legal conclusions drawn from those facts. An officially noticed fact or legal conclusion must be one not subject to reasonable dispute in that it is either (i) generally known within the jurisdiction of the Presiding Officer; (ii) known by the Presiding Officer in areas of his or her expertise; or (iii) capable of accurate and ready determination by resort to sources whose accuracy cannot reasonably be questioned.

(2) Method of taking official notice. The Presiding Officer may at any time take
Official notice upon motion of any party or upon its own initiative. The record shall reflect the facts and conclusions which have been officially noticed.

(3) Opportunity to challenge. Any party may upon application in writing rebut officially noticed facts and conclusions by supplementing the record. The Presiding Officer shall determine the permissible extent of this challenge; that is, whether to limit the party to presentation of written materials, whether to allow presentation of testimony, whether to allow cross-examination, or whether to allow oral argument. The Presiding Officer shall grant or deny the application on the record.

(f) Objections and exceptions. Objections to evidence shall be timely interposed, shall appear on the record, and shall contain the grounds upon which they are based. Rulings on all objections, and the bases therefore, shall appear on the record. Formal exception to an adverse ruling is not required to preserve the question for appeal.

(g) Offer of proof. When an objection to proffered testimony or documentary evidence is sustained, the sponsoring party may make a specific offer, either in writing or orally, of what the party expects to prove by the testimony or the document. When an offer of proof is made, any other party may make a specific offer, either in writing or orally, of what the party expects to present to rebut or contradict the offer of proof. Written offers of proof or of rebuttal, adequately marked for identification, shall accompany the record and be available for consideration by any reviewing authority.

§511.44 Expert witnesses.

(a) Definition. An expert witness is one who, by reason of education, training, experience, or profession, has peculiar knowledge concerning the matter of science or skill to which his or her testimony relates and from which he or she may draw inferences based upon hypothetically stated facts or from facts involving scientific or technical knowledge.

(b) Method of presenting testimony of expert witness. Except as may be otherwise ordered by the Presiding Officer, a detailed written statement of the elements of the direct testimony of an expert witness shall be filed on the record and exchanged between the parties no later than 10 days preceding the commencement of the hearing. The statement must contain a full explanation of the methodology underlying any analysis, and a full disclosure of the basis of any opinion. The direct testimony of an expert witness shall not include points not contained in the written statement. A party may waive direct examination of an expert witness by indicating that the written statement be considered the testimony of the witness. In such a case, the written testimony shall be incorporated into the record and shall constitute the testimony of the witness.

§511.45 In camera materials.

(a) Definition. In camera materials are documents, testimony, or other data which by order of the Presiding Officer or the Administrator, as appropriate under this part, are kept confidential and excluded from the public record. Only materials exempt under the Freedom of Information Act may be kept confidential and excluded from the public record. Pursuant to 49 CFR part 512, the Chief Counsel of the NHTSA is responsible for determining whether an alleged confidential business record is exempt from the Freedom of Information Act. The right of the Presiding Officer, the Administrator and reviewing courts to order disclosure of in camera materials is specifically reserved.

(b) In camera treatment of documents and testimony. The Presiding Officer or the Administrator, as appropriate under this part, shall have authority,
when good cause is found on the record, to order documents or testimony offered in evidence, whether admitted or rejected, to be received and preserved in camera. The order shall specify the length of time for in camera treatment and shall include:

(1) A description of the documents and/or testimony;
(2) The reasons for granting in camera treatment for the specified length of time.

(c) Access and disclosure to parties. (1) The Administrator and Presiding Officer, and their immediate advisory staffs shall have complete access to all in camera materials. All other parties shall also have complete access to all in camera materials, except that these parties may seek access only in accordance with paragraph (c)(2) of this section when:

(i) The in camera materials consist of information obtained by the government from persons not parties to the proceeding; or
(ii) The in camera materials consist of information provided by one of the parties to the proceeding which is confidential as to the other parties to the proceeding.

(2) Any party desiring access to and/or disclosure of the in camera materials specified in paragraph (c)(1) (i) and (ii) of this section for the preparation and presentation of that party’s case shall make a motion which sets forth the justification therefor. The Presiding Officer or the Administrator, as appropriate under this part, may grant such motion which sets forth the justification therefor. The Presiding Officer or the Administrator, as appropriate under this part, may grant such motion which sets forth the justification therefor. The Presiding Officer or the Administrator, as appropriate under this part, may grant such motion which sets forth the justification therefor. The Presiding Officer or the Administrator, as appropriate under this part, may grant such motion which sets forth the justification therefor.

(d) Segregation of in camera materials. In camera materials shall be segregated from the public record and protected from public view.

(e) Public release of in camera materials. In camera materials constitute a part of the confidential records of the NHTSA and shall not be released to the public until the expiration of in camera treatment.

(f) Reference to in camera materials. In the submission of proposed findings, conclusions, briefs, or other documents, all parties shall refrain from disclosing specific details of in camera materials. Such refraining shall not preclude general references to such materials. To the extent that parties consider it necessary to include specific details of in camera materials, the references shall be incorporated into separate proposed findings, briefs, or other documents marked “CONFIDENTIAL, CONTAINS IN CAMERA MATERIAL,” which shall be placed in camera and become part of the in camera record.

These documents shall be served only on parties accorded access to the in camera materials in accordance with paragraph (c)(2) of this section.

§ 511.46 Proposed findings, conclusions, and order.

Within a reasonable time after the closing of the record and receipt of the transcript, all parties and participants may, simultaneously, file post-hearing briefs, including proposed findings of fact, conclusions of law and a proposed order, together with reasons therefore. The Presiding Officer shall establish a date certain for the filing of the briefs, which shall not exceed 45 days after the close of the record except in unusual circumstances. The briefs shall be in writing, shall be served upon all parties, and shall contain adequate references to the record and authorities relied on. Replies shall be filed within fifteen (15) days of the date for the filing of briefs unless otherwise established by the Presiding Officer. The parties and participants may waive either or both submissions.

§ 511.47 Record.

(a) Reporting and transcription. Hearings shall be recorded and transcribed under the supervision of the Presiding Officer by a reporter appointed by the Administrator. The original transcript shall be a part of the record and the official transcript. Copies of transcripts are available from the reporter at a cost not to exceed the maximum rates fixed by contract between the NHTSA and the reporter.
§ 511.53 Appeal from initial decision.

(a) Who may file notice of intention. Any party may appeal an Initial Decision to the Administrator provided that within ten (10) days after issuance of the Initial Decision such party files and serves a notice of intention to appeal.

(b) Appeal brief. The appeal shall be in the form of a brief, filed within forty (40) days after service of the Initial Decision, duly served upon all parties and participants. The appeal brief shall contain, in the order indicated, the following:

Subpart F—Decision

§ 511.51 Initial decision.

(a) When filed. The Presiding Officer shall endeavor to file an Initial Decision with the Administrator within sixty (60) days of the close of the record, the filing of post-hearing briefs, or the filing of replies thereto, whichever is latest.

(b) Content. The Initial Decision shall be based upon a consideration of the entire record and it shall be supported by reliable, probative, and substantial evidence. It shall include:

(1) Findings and conclusions, as well as the reasons or bases therefor, upon the material questions of fact, material issues of law, or discretion presented on the record, and should, where practicable, be accompanied by specific page citations to the record and to legal and other materials relied upon.

(2) An appropriate order.

(c) By whom made. The Initial Decision shall be made and filed by the Presiding Officer who presided over the hearing, unless otherwise ordered by the Administrator.

(d) Reopening of proceeding by presiding officer; termination of jurisdiction.

(1) At any time prior to or concomitant with the filing of the Initial Decision, the Presiding Officer may reopen the proceedings for the reception of further evidence.

(2) Except for the correction of clerical errors, the jurisdiction of the Presiding Officer is terminated upon the filing of the Initial Decision, unless and until the proceeding is remanded to the Presiding Officer by the Administrator.

§ 511.52 Adoption of initial decision.

The Initial Decision and Order shall become the Final Decision and Order of the Administrator forty (40) days after issuance unless an appeal is noted and perfected or unless review is ordered by the Administrator. Upon the expiration of the fortieth day, the Executive Secretary shall prepare, sign and enter an order adopting the Initial Decision and Order.

§ 511.53 Appeal from initial decision.

(a) Who may file notice of intention. Any party may appeal an Initial Decision to the Administrator provided that within ten (10) days after issuance of the Initial Decision such party files and serves a notice of intention to appeal.

(b) Appeal brief. The appeal shall be in the form of a brief, filed within forty (40) days after service of the Initial Decision, duly served upon all parties and participants. The appeal brief shall contain, in the order indicated, the following:

(b) Content. The Initial Decision shall be based upon a consideration of the entire record and it shall be supported by reliable, probative, and substantial evidence. It shall include:

(1) Findings and conclusions, as well as the reasons or bases therefor, upon the material questions of fact, material issues of law, or discretion presented on the record, and should, where practicable, be accompanied by specific page citations to the record and to legal and other materials relied upon.

(2) An appropriate order.

(c) By whom made. The Initial Decision shall be made and filed by the Presiding Officer who presided over the hearing, unless otherwise ordered by the Administrator.

(d) Reopening of proceeding by presiding officer; termination of jurisdiction.

(1) At any time prior to or concomitant with the filing of the Initial Decision, the Presiding Officer may reopen the proceedings for the reception of further evidence.

(2) Except for the correction of clerical errors, the jurisdiction of the Presiding Officer is terminated upon the filing of the Initial Decision, unless and until the proceeding is remanded to the Presiding Officer by the Administrator.

§ 511.52 Adoption of initial decision.

The Initial Decision and Order shall become the Final Decision and Order of the Administrator forty (40) days after issuance unless an appeal is noted and perfected or unless review is ordered by the Administrator. Upon the expiration of the fortieth day, the Executive Secretary shall prepare, sign and enter an order adopting the Initial Decision and Order.

§ 511.53 Appeal from initial decision.

(a) Who may file notice of intention. Any party may appeal an Initial Decision to the Administrator provided that within ten (10) days after issuance of the Initial Decision such party files and serves a notice of intention to appeal.

(b) Appeal brief. The appeal shall be in the form of a brief, filed within forty (40) days after service of the Initial Decision, duly served upon all parties and participants. The appeal brief shall contain, in the order indicated, the following:
(1) A subject index of the matters in
the brief, with page references, and a
table of cases (alphabetically ar-
ranged), textbooks, statutes, and other
material cited, with page references
thereto;
(2) A concise statement of the case;
(3) A specification of the position
urged;
(4) The argument, presenting clearly
the points of fact and law relied upon
in support of the position on each ques-
tion, with specific page references to
the record and the legal or other mate-
rial relied upon; and
(5) A proposed form of order for the
Administrator’s consideration in lieu
of the order contained in the Initial
Decision.
(c) Answering brief. Within thirty (30)
days after service of the appeal brief
upon all parties and participants, any
party may file an answering brief
which shall also contain a subject
index, with page references, and a table
of cases (alphabetically arranged),
textbooks, statutes, and other material
cited, with page references thereto.
Such brief shall present clearly the
points of fact and law relied upon in
support of the position taken on each
question, with specific page references
to the record and legal or other mate-
rial relied upon.
(d) Participant’s brief. Within thirty
(30) days after service of the appeal
brief upon all parties and participants,
any participant may file an appeal
brief which should contain a subject
index, with page references, and a table
of authorities being relied upon. Such
brief shall present clearly the position
taken by the participant on each ques-
tion raised by the appellant(s).
(e) Cross appeal. If a timely notice of
appeal is filed by a party, any other
party may file a notice of cross-appeal
within ten (10) days of the date on
which the first notice of appeal was
filed. Cross-appeals shall be included in
the answering brief and shall conform
to the requirements for form, content,
and filing specified in paragraph (c) of
this section. If an appeal is noticed but
not perfected, no cross-appeal shall be
permitted and the notice of cross-ap-
peal shall be deemed void.
(f) Reply brief. A reply brief shall be
limited to rebuttal of matters in an-
swering briefs, including matters
raised in cross-appeals. A reply brief
shall be filed and within fourteen (14)
days after service of an answering
brief, or on the day preceding the oral
argument, whichever comes first.
(g) Oral argument. The purpose of an
oral argument is to emphasize and
clarify the issues. Any party may re-
quest oral argument. The Adminis-
trator may order oral argument upon
request or upon his or her own initia-
tive. All oral arguments shall be re-
ported and transcribed.
§511.54 Review of initial decision in
absence of appeal.
The Administrator may, by order, re-
view a case not otherwise appealed by
a party. Thereupon the parties shall
and participants may file briefs in ac-
cordance with §511.53(b), (c), (d), (e),
and (f) except that the Administrator
may, in his or her discretion, establish
a different briefing schedule in his or
her order. Any such order shall issue
within forty (40) days of issuance of the
Initial Decision. The order shall set
forth the issues which the Adminis-
trator will review.
§511.55 Final decision on appeal or re-
view.
(a) Upon appeal from or review of an
Initial Decision, the Administrator
shall consider such parts of the record
as are cited or as may be necessary to
resolve the issues presented and, in ad-
dition, shall, to the extent necessary or
desirable, exercise all the powers which
he or she could have exercised if he or
she had made the Initial Decision.
(b) In rendering his or her decision,
the Administrator shall adopt, modify,
or set aside the findings, conclusions,
and order contained in the Initial Deci-
sion, and shall include in his or her Final Decision a statement of the rea-
sons or bases for his or her action. The
Administrator shall issue an order re-
flecting his or her Final Decision.
§511.56 Reconsideration.
Within twenty (20) days after
issuance of a Final Decision and Order,
any party may file with the Adminis-
trator a petition for reconsideration of
such decision or order, setting forth
the relief desired and the grounds in
support thereof. Any party desiring to oppose such a petition shall file an answer thereto within ten (10) days after service of the petition. The filing of a petition for reconsideration shall not stay the effective date of the Decision and Order or toll the running of any statutory time period affecting the decision or order unless specifically so ordered by the Administrator.

§ 511.57 Effective date of order.

(a) Consent orders. An order which has been issued following acceptance of an offer of settlement in accordance with §511.26 becomes effective upon issuance.

(b) Litigated orders. All other orders become effective upon the expiration of the statutory period for court review specified in section 508(c)(1) of the Motor Vehicle Information and Cost Savings Act, title 15, U.S.C. section 2008(c)(1), Pub. L. 94–163, 89 Stat. 911, or, if a petition for review has been filed, upon court affirmance of the Administrator’s order.

Subpart G—Settlement Procedure in Cases of Violation of Average Fuel Economy Standards

§ 511.61 Purpose.

This subpart establishes the procedures and requirements necessary to obtain a settlement of a case of violation of section 507 (1) or (2) of the Motor Vehicle Information and Cost Savings Act, as amended, Pub. L. 94–163, 89 Stat. 911 (15 U.S.C. section 2007(1)(2)). No settlement of such cases may be had except as in accordance with this subpart.

§ 511.62 Definitions.

Average fuel economy standard means an average fuel economy standard established by or pursuant to the Motor Vehicle Information and Cost Savings Act.

Insolvency means the inability to meet expenses when due.

Settlement means a compromise, modification, or remission of a civil penalty assessed under this part for a violation of an average fuel economy standard.

§ 511.63 Criteria for settlement.

Settlement of a case of violation of an average fuel economy standard is discretionary with the Administrator. The Administrator will consider settlement only to the extent:

(a) Necessary to prevent the insolvency or bankruptcy of the person seeking settlement, or

(b) That the violation of the average fuel economy standard resulted, as shown by the person seeking settlement, from an act of God, a strike, or fire, or

(c) That modification of a civil penalty assessed under this part is necessary to prevent lessening of competition, as determined and as certified by the Federal Trade Commission under section 508(b)(4) of the Motor Vehicle Information and Cost Savings Act, Pub. L. 94–163, 89 Stat. 911 (15 U.S.C. section 2008(b)(4)).

§ 511.64 Petitions for settlement; timing, contents.

(a) A petition seeking settlement under this subpart must be filed within 30 days after the issuance of a final order assessing a civil penalty for a violation of an average fuel economy standard. (b)(1) A petition for settlement should be sufficient to allow the Administrator to determine that at least one of the criteria set out in §511.63 is satisfied, and that the public interest would be served by settlement.

(2) A petition asserting that settlement is necessary to prevent bankruptcy or insolvency must include:

(i) Copies of all pertinent financial records, auditor’s reports, and documents that show that the imposition of a civil penalty would cause insolvency, or would cause a company to do an act of bankruptcy, and

(ii) A payment schedule that would allow the petitioner to pay a civil penalty without resulting in insolvency or an act of bankruptcy.

(3) A petition asserting that the violation of the average fuel economy standard was caused by an act of God, fire, or strike must describe corrective and ameliorative steps taken to mitigate the effects of the act of God, fire, or strike.
§ 511.65 Public comment.

Notice and opportunity for comment are provided to the public in regard to settlements under this part. Subject to § 511.66, notice of receipt of a petition for settlement is published in the Federal Register, and a copy of such petitions and any supporting information is placed in a public docket. Any settlement agreed to by the Administrator shall be placed in the public docket for 30 days so that interested persons may comment thereon. No settlement is binding until the completion of that thirty day period.

§ 511.66 Confidential business information.

The Administrator shall have authority to segregate from the public docket and to protect from public view information in support of a petition for settlement which has been determined to be confidential business information. The provisions of 15 U.S.C. 2005(d) pertaining to discretionary release by the Administrator of and to limited disclosure of information determined to be confidential business information shall apply to this section.

§ 511.67 Settlement order.

If, in accordance with this subpart, the Administrator allows a settlement of a case of violation of an average fuel economy standard, an order of settlement shall be issued, setting out the terms of the settlement, and containing a brief discussion of the factors underlying the exercise of the Administrator’s discretion in allowing the settlement, including a discussion of comments received under § 511.65. If the Administrator rejects a petition for settlement, the Administrator shall give written notice of the rejection and the reasons for the rejection to the parties and the Presiding Officer.

[53 FR 15783, May 3, 1988]

Subpart H—Appearances; Standards of Conduct

§ 511.71 Who may make appearances.

A party or participant may appear in person, or by a duly authorized officer, partner, regular employee, or other agent of this party or participant, or by or with counsel or other duly qualified representative, in any proceeding under this part.

§ 511.72 Authority for representation.

Any individual acting in a representative capacity in any adjudicative proceeding may be required by the Presiding Officer or the Administrator to show his or her authority to act in such capacity. A regular employee of a party who appears on behalf of the party shall be required by the Presiding Officer or the Administrator to show his or her authority to so appear.
§ 511.73 Written appearances.

(a) Any person who appears in a proceeding shall file a written notice of appearance with the Executive Secretary or deliver a written notice of appearance to the reporter at the hearing, stating for whom the appearance is made and the name, address, and telephone number (including area code) of the person making the appearance and the date of the commencement of the appearance. The written appearance shall be made a part of the record.

(b) Any person who has previously appeared in a proceeding may withdraw his or her appearance by filing a written notice of withdrawal of appearance with the Docket Section. The notice of withdrawal shall state the name, address, and telephone number (including area code) of the person withdrawing the appearance, for whom the appearance was made, and the effective date of the withdrawal of the appearance, and such notice of withdrawal shall be filed within five (5) days of the effective date of the withdrawal of the appearance.

An attorney at law who is admitted to practice before the Federal courts or before the highest court of any State, the District of Columbia, or any territory or Commonwealth of the United States, may practice before the NHTSA. An attorney’s own representation that he or she is in good standing before any of such courts shall be sufficient proof thereof, unless otherwise ordered by the Presiding Officer or the Administrator.

§ 511.75 Persons not attorneys.

(a) Any person who is not an attorney at law may be admitted to appear in an adjudicative proceeding if that person files proof to the satisfaction of the Presiding Officer that he or she possesses the necessary legal, technical or other qualifications to render valuable service in the proceeding and is otherwise competent to advise and assist in the presentation of matters in the proceeding. An application by a person not an attorney at law to appear in a proceeding shall be submitted in writing to the Docket Section, not later than thirty (30) days prior to the hearing in the proceeding. The application shall set forth the applicant’s qualifications to appear in the proceeding.

(b) No person who is not an attorney at law and whose application has not been approved shall be permitted to appear in the Administration’s proceedings. However, this provision shall not apply to any person who appears before the NHTSA on his or her own behalf or on behalf of any corporation, partnership, or association of which the person is a partner, officer, or regular employee.

(a) The NHTSA expects all persons appearing in proceedings before it to act with integrity, with respect, and in an ethical manner. Business transacted before and with the NHTSA shall be in good faith.

(b) To maintain orderly proceedings, the Presiding Officer or the Administrator, as appropriate under this part, may exclude parties, participants, and their representatives for refusal to comply with directions, continued use of dilatory tactics, refusal to adhere to reasonable standards of orderly and ethical conduct, failure to act in good faith, or violation of the prohibition against certain ex parte communications. The Presiding Officer may, in addition to the above sanctions, deny access to additional in camera materials when a party or participant publicly releases such materials without authorization.

(c) An excluded party, participant, or representative thereof may petition the Administrator to entertain an interlocutory appeal in accordance with §511.24. If, after such appeal, the representative of a party or participant, is excluded, the hearing shall, at the request of the party or participant, be suspended for a reasonable time so that the party or participant may obtain another representative.
§ 511.77 Restrictions as to former members and employees.

The postemployee restrictions applicable to former Administrators and NHTSA employees, as set forth in 18 U.S.C. 207, shall govern the activities of former Administrators and NHTSA employees in matters connected with their former duties and responsibilities.

§ 511.78 Prohibited communications.

(a) Applicability. This section is applicable during the period commencing with the date of issuance of a complaint and ending upon final NHTSA action in the matter.

(b) Definitions. (1) “Decision-maker” means those NHTSA personnel who render decisions in adjudicative proceedings under this part, or who advise officials who render such decisions, including:
   (i) The Administrator,
   (ii) The Administrative Law Judges;
   (2) “Ex parte communication” means:
   (i) Any written communication other than a request for a status report on the proceeding made to a decision-maker by any person other than a decisionmaker which is not served on all parties.
   (ii) Any oral communication other than a request for a status report on the proceeding made to a decision-maker by any person other than a decisionmaker without advance notice to the parties to the proceeding and opportunity for them to be present.
   (c) Prohibited ex parte communications. Any oral or written ex parte communication relative to the merits of a proceeding under this part is a prohibited ex parte communication, except as provided in paragraph (d) of this section.
   (d) Permissible ex parte communications. The following communications shall not be prohibited under this section:
   (1) Ex parte communications authorized by statute or by this part.
   (2) Any staff communication concerning judicial review or judicial enforcement in any matter pending before or decided by the Administrator.
   (e) Procedures for handling prohibited ex parte communication. (1) Prohibited written ex parte communication. To the extent possible, a prohibited written ex parte communication received by any NHTSA employee shall be forwarded to the Docket Section rather than to a decisionmaker. A prohibited written ex parte communication which reaches a decisionmaker shall be forwarded by the decisionmaker to the Docket Section. If the circumstances in which a prohibited ex parte written communication was made are not apparent from the communication itself, a statement describing those circumstances shall be forwarded with the communication.
   (ii) In the event of a prohibited oral ex parte communication, the decisionmaker shall forward to the Docket Section a dated statement containing such of the following information as is known to him/her:
   (A) The title and docket number of the proceeding;
   (B) The name and address of the person making the communication and his/her relationship (if any) to the parties to the proceeding;
   (C) The date and time of the communication, its duration, and the circumstances (telephone call, personal interview, etc.) under which it was made;
   (D) A brief statement of the substance of the matters discussed;
   (E) Whether the person making the communication persisted in doing so after being advised that the communication was prohibited.
   (3) All communications and statements forwarded to the Docket Section under this section shall be placed in the public file which shall be associated with, but not made a part of, the record of the proceedings to which the communication or statement pertains.
   (4) Service on parties. The Administrator shall serve a copy of each communication and statement forwarded under this section on all parties to the proceedings. However, if the parties are numerous, or if other circumstances satisfy the Administrator that service of the communication or statement
would be unduly burdensome, he or she may, in lieu of service, notify all parties in writing that the communication or statement has been made and filed and that it is available for inspection and copying.

(5) Service on maker. The Administrator shall forward to the person who made the prohibited ex parte communication a copy of each communication or statement filed under this section.

(f) Effect of ex parte communications. No prohibited ex parte communication shall be considered as part of the record for decision unless introduced into evidence by a party to the proceedings.

(g) Sanctions. A party or participant who makes a prohibited ex parte communication, or who encourages or solicits another to make any such communication, may be subject to any appropriate sanction or sanctions, including, but not limited to, exclusion from the proceedings and adverse rulings on the subject on which each witness will testify.

APPENDIX I TO PART 511—FINAL PREHEARING ORDER

Case Caption

Final Prehearing Order

A prehearing conference was held in this matter pursuant to Rule 21 of the Administration’s Rules of Practice for Adjudicative Proceedings, on the day of , 19 , at o’clock .

Counsel appeared as follows:

For the Administration staff:

For the Respondent(s):

Others:

1. NATURE OF ACTION AND JURISDICTION.

This is an action for

and the jurisdiction of the Administration is involved under Section of Title . The jurisdiction of the Administration is (not) disputed. The questions of jurisdiction was decided as follows:

2. STIPULATIONS AND STATEMENTS.

The following stipulations and statements were submitted, attached to, and made a part of this order:

(a) A comprehensive written stipulation or statement of all uncontested facts;
(b) A concise summary of the ultimate facts as claimed by each party. (Complaint Counsel must set forth the claimed facts specifically; for example, if violation is claimed, Complaint Counsel must assert specifically the acts of violation complained of; each respondent must reply with equal clarity and detail.)
(c) Written stipulations or statements setting forth the qualifications of the expert witnesses to be called by each party;
(d) A written list or lists of the witnesses whom each party will call, a written list or lists of the additional witnesses whom each party may call, and a statement of the subject on which each witness will testify;
(e) An agreed statement of the contested issues of fact and of law, and/or separate statements by each party or any contested issues of fact and law not agreed to;
(f) A list of all depositions to be read into evidence and statements of any objections thereto;
(g) A list and brief description of any charts, graphs, models, schematic diagrams, and similar objects that will be used in opening statements or closing arguments, but will not be offered in evidence. If any other such objects are to be used by any party, they will be submitted to opposing counsel at least three days prior to hearing. If there is then any objection to their use, the dispute will be submitted to the Presiding Officer at least one day prior to hearing;
(h) Written waivers of claims or defenses which have been abandoned by the parties. The foregoing were modified at the pretrial conference as follows:

[To be completed at the conference itself. If none, recite “none”]

3. COMPLAINT COUNSEL’S EVIDENCE.

3.1 The following exhibits were offered by Complaint Counsel, received in evidence, and marked as follows:

[Identification number and brief description of each exhibit]

The authenticity of these exhibits has been stipulated.

3.2 The following exhibits were offered by the Complaint Counsel and marked for identification. There was reserved to the respondent(s) and party intervenors, if any, the right to object to their receipt in evidence on the grounds stated:

[Identification number and brief description of each exhibit. State briefly ground of objection, e.g., competency, relevancy, materiality]

4. RESPONDENT’S EVIDENCE.
4.1 The following exhibits were offered by the respondent(s), received in evidence, and marked as herein indicated:

[Identification number and brief description of each exhibit]

The authenticity of these exhibits has been stipulated.

4.2 The following exhibits were offered by the respondent(s) and marked for identification. There was reserved to Complaint Counsel and party intervenors, if any, the right to object to their receipt in evidence on the grounds stated:

[Identification number and brief description of each exhibit. State briefly ground of objection, e.g., competency, relevancy, materiality]

5. ADDITIONAL ACTIONS.
The following additional action was taken:

[Amendments to pleadings, agreements of the parties, disposition of motions, separation of issues of liability and remedy, etc., if necessary]

6. LIMITATIONS AND RESERVATIONS.

6.1 Each of the parties has the right to further supplement the list of witnesses not later than ten (10) days prior to trial by furnishing opposing counsel with the name and address of the witness and general subject matter of his or her testimony and filing a supplement to this pretrial order. Thereafter additional witnesses may be added only after application to the Presiding Officer, for good cause shown.

6.2 Rebuttal witnesses not listed in the exhibits to this order may be called only if the necessity of their testimony could not reasonably be foreseen ten (10) days prior to trial. If it appears to counsel at any time before trial that such rebuttal witnesses will be called, notice will immediately be given to opposing counsel and the Presiding Officer.

6.3 The probable length of hearing is ______ days. The hearing will be commenced on the ______ day of ______, 19__, at ______ o'clock ______ M. at (location). ______.

6.4 Prehearing briefs will be filed not later than 5:00 p.m. on ______. (Insert date not later than ten (10) days prior to hearing.) All anticipated legal questions, including those relating to the admissibility of evidence, must be covered by prehearing briefs.

This prehearing order has been formulated after a conference at which counsel for the respective parties appeared. Reasonable opportunity has been afforded counsel for corrections or additions prior to signing. It will control the course of the hearing, and it may not be amended except by consent of the parties and the Presiding Officer, or by order of the Presiding Officer to prevent manifest injustice.

Subpart A—General Provisions

§ 512.1 Purpose and scope.

The purpose of this part is to establish the procedures and standards by which NHTSA will consider claims that information submitted to the agency is entitled to confidential treatment under 5 U.S.C. 552(b), most often because it constitutes confidential business information as described in 5 U.S.C. 552(b)(4), and to address the treatment of information determined to be entitled to confidential treatment.

§ 512.2 Applicability.

(a) This part applies to all information submitted to NHTSA, except as provided in paragraph (b) of this section, for which a determination is sought that the material is entitled to confidential treatment under 5 U.S.C. 552(b), most often because it constitutes confidential business information as described in 5 U.S.C. 552(b)(4), and should be withheld from public disclosure.

(b) Information received as part of the procurement process is subject to the Federal Acquisition Regulation, 48 CFR Chapter 1, as well as this part. In any case of conflict between the Federal Acquisition Regulation and this part, the provisions of the Federal Acquisition Regulation prevail.

§ 512.3 Definitions.

Whenever used in this part:

(a) Administrator means the Administrator of the National Highway Traffic Safety Administration.

(b) Chief Counsel means the Chief Counsel of the National Highway Traffic Safety Administration.

(c) Confidential business information means trade secrets or commercial or financial information that is privileged or confidential, as described in 5 U.S.C. 552(b)(4).

(1) A trade secret is a secret, commercially valuable plan, formula, process, or device that is used for the making, preparing, compounding, or processing of trade commodities and that can be said to be the end product of either innovation or substantial effort.

(2) Commercial or financial information is considered confidential if it has not been publicly disclosed and:

(i) If the information was required to be submitted and its release is likely to impair the Government’s ability to obtain necessary information in the future, or is likely to cause substantial harm to the competitive position of the person from whom the information was obtained; or

(ii) If the information was voluntarily submitted and is the kind of information that is customarily not released to the public by the person from whom it was obtained.

(d) NHTSA means the National Highway Traffic Safety Administration.

(e) “Substantial competitive harm” includes “significant competitive damage” under Chapter 329 of Title 49 of the United States Code, Automobile Fuel Economy, 49 U.S.C. 32910(c).
§ 512.4 When requesting confidentiality, what should I submit?

Any person submitting information to NHTSA, other than information in a class identified in Appendix C of this Part, and requesting that the information be withheld from public disclosure pursuant to 5 U.S.C. 552(b) shall submit the following:

(a) The materials for which confidentiality is being requested, in conformance with §§ 512.5, 512.6, and 512.7 of this part;
(b) The Certificate, in the form set out in Appendix A to this part;
(c) Supporting information, in conformance with §512.8; and
(d) Any request for an extension of time, made in accordance with §512.11.

§ 512.5 How many copies should I submit?

(a) Except as provided for in subsection (c), a person must send the following in hard copy or electronic format to the Chief Counsel when making a claim for confidential treatment covering submitted material:

(1) A complete copy of the submission, and
(2) A copy of the submission containing only the portions for which no claim of confidential treatment is made and from which those portions for which confidential treatment is claimed has been redacted, and
(3) Either a second complete copy of the submission or, alternatively, those portions of the submission containing the material for which confidential treatment is claimed and any additional information the submitter deems important to the Chief Counsel’s consideration of the claim.

(4) If submitted in electronic format, a copy of any special software required to review materials for which confidential treatment is requested and user instructions must also be provided.

(b) A person filing comments to a rulemaking action must additionally submit to the rulemaking docket a copy of the submission containing only the portions for which no claim of confidential treatment is made and from which those portions for which confidential treatment is claimed has been redacted.

(c) Any person submitting blueprints or engineering drawings need only provide an original version with their submission.

§ 512.6 How should I prepare documents when submitting a claim for confidentiality?

(a) Information claimed to be confidential must be clearly identified to enable the agency to distinguish between those portions of the submission claimed to constitute confidential business information and those portions for which no such claim is made.

(b) The word “CONFIDENTIAL” must appear on the top of each page containing information claimed to be confidential.

(1) If an entire page is claimed to be confidential, the submitter must indicate clearly that the entire page is claimed to be confidential.

(2) If the information for which confidentiality is being requested is contained within a page, the submitter shall enclose each item of information that is claimed to be confidential within brackets: “[ ].”

(c) Submissions in electronic format—(1) Persons submitting information under this Part may submit the information in an electronic format. Except for early warning reporting data submitted to the agency under 49 CFR part 579, the information submitted in an electronic format shall be submitted in a physical medium such as a CD-ROM. The exterior of the medium (e.g., the disk itself) shall be permanently labeled with the submitter’s name, the subject of the information and the words “CONFIDENTIAL BUSINESS INFORMATION”.

(2) Confidential portions of electronic files submitted in other than their original format must be marked “Confidential Business Information” or “Entire Page Confidential Business Information” at the top of each page. If only a portion of a page is claimed to be confidential, that portion shall be designated by brackets. Files submitted in their original format that cannot be marked as described above...
must, to the extent practicable, identify confidential information by alternative markings using existing attributes within the file or means that are accessible through use of the file’s associated program. When alternative markings are used, such as font changes or symbols, the submitter must use one method consistently for electronic files of the same type within the same submission. The method used for such markings must be described in the request for confidentiality. Files and materials that cannot be marked internally, such as video clips or executable files or files provided in a format specifically requested by the agency, shall be renamed prior to submission so the words “Confidential Bus Info” appears in the file name or, if that is not practicable, the characters “Conf Bus Info” or “Conf” appear. In all cases, a submitter shall provide an electronic copy of its request for confidential treatment on any medium containing confidential information, except where impracticable.

(3) Confidential portions of electronic files submitted in other than their original format must be marked with consecutive page numbers or sequential identifiers so that any page can be identified and located using the file name and page number. Confidential portions of electronic files submitted in their original format must, if practicable, be marked with consecutive page numbers or sequential identifiers so that any page can be identified and located using the file name and page number. Confidential portions of electronic files submitted in their original format that cannot be marked as described above must, to the extent practicable, identify the portions of the file that are claimed to be confidential through the use of existing indices or placeholders embedded within the file. If such indices or placeholders exist, the submitter’s request for confidential treatment shall clearly identify them and the means for locating them within the file. If files submitted in their original format cannot be marked with page or sequence number designations and do not contain existing indices or placeholders for locating confidential information, then the portions of the files that are claimed to be confidential shall be described by other means in the request for confidential treatment. In all cases, submitters shall provide an electronic copy of their request for confidential treatment on any medium containing confidential data except where impracticable.

(4) Electronic media may be submitted only in commonly available and used formats.

§ 512.7 Where should I send the information for which I am requesting confidentiality?

A claim for confidential treatment must be submitted in accordance with the provisions of this regulation to the Chief Counsel of the National Highway Traffic Safety Administration, 1200 New Jersey Avenue, SE., West Building W41–227, Washington, DC 20590.

§ 512.8 What supporting information should I submit with my request?

When requesting confidentiality, the submitter shall:

(a) Describe the information for which confidentiality is being requested;

(b) Identify the confidentiality standard(s) under which the confidentiality request should be evaluated, in accordance with § 512.15;

(c) Justify the basis for the claim of confidentiality under the confidentiality standard(s) identified pursuant to paragraph (b) of this section by describing:

(1) Why the information qualifies as a trade secret, if the basis for confidentiality is that the information is a trade secret;

(2) What the harmful effects of disclosure would be and why the effects should be viewed as substantial, if the claim for confidentiality is based upon substantial competitive harm;

(3) What significant NHTSA interests will be impaired by disclosure of the information and why disclosure is likely to impair such interests, if the claim for confidentiality is based upon impairment to government interests;

(4) What measures have been taken by the submitter to ensure that the information is not customarily disclosed
§ 512.9 What are the requirements if the information comes from a third party?

Where confidentiality is claimed for information obtained by the submitter from a third party, such as a supplier, the submitter is responsible for obtaining from the third party the information that is necessary to comply with § 512.4 of this part, including a certificate in the form set out in Appendix A to this Part.

§ 512.10 Duty to amend.

The submitter shall promptly amend any supporting information provided under § 512.4 if the submitter obtains information upon the basis of which the submitter knows that the supporting information was incorrect when provided, or that the supporting information, though correct when provided to the agency, is no longer correct and the circumstances are such that a failure to amend the supporting information is in substance a knowing concealment.

§ 512.11 What if I need an extension of time?

If a person is unable to submit the necessary information required under § 512.4 at the time the claimed confidential information is submitted to NHTSA, then that person may request an extension of time. Any request for an extension shall explain the reason for the extension of time and the length of time requested.

§ 512.12 What if I am submitting multiple items of information?

Any certificate provided under § 512.4(b) of this part, and any supporting information provided under § 512.4(c) of this part, may be used to support a claim for confidential treatment of more than one item of information. However, general or nonspecific assertions or analysis may be insufficient to form an adequate basis for the agency to find that the information is entitled to confidential treatment, and may result in the denial of the claim.

§ 512.13 What are the consequences for noncompliance with this part?

(a) If the submitter fails to comply with § 512.4 of this part at the time the information is submitted to NHTSA or does not request an extension of time under § 512.11, the claim for confidentiality may be waived, unless the agency is notified or otherwise becomes aware of the claim before the information is disclosed to the public. If the information is placed in a public docket or file, such placement is disclosure to the public within the meaning of this part and may preclude any claim for confidential treatment. The Chief Counsel may notify a submitter of information of inadequacies regarding a claim for confidential treatment and may allow the submitter or third party additional time to supplement the submission, but has no obligation to provide either notice or additional time.

(b) If the submitter does not provide the certificate required under § 512.4(b) of this part or any supporting information required under § 512.4(c) of this part, or if the information is insufficient to establish that the information should be afforded confidential treatment under the confidentiality standards set out in § 512.15 of this part, a request that such information be treated confidentially may be denied. The Chief Counsel may notify a submitter of information of inadequacies in the supporting information and may allow
§ 512.18 How will I be notified of the confidentiality determination?

(a) If a request for confidential treatment is granted, the submitter of the information will be notified in writing of the determination and of any appropriate limitations.

(b) If a request for confidential treatment is denied in whole or in part, the submitter of the information will be notified in writing of the denial, by certified mail, return receipt requested. The information may be made available to the public twenty (20) working days after the submitter of the information has received notice of the denial, unless a request for reconsideration is filed. The information may be released publicly on an earlier
date, if the Chief Counsel determines in writing that the public interest requires that the information be made available to the public on such date.

§ 512.19 What can I do if I disagree with the determination?

(a) A submitter of information whose request for confidential treatment is denied in whole or in part, may petition for reconsideration of that decision. Petitions for reconsideration shall be addressed to and received by the Chief Counsel prior to the date on which the information would otherwise be made available to the public. The determination by the Chief Counsel upon such petition for reconsideration shall be administratively final.

(b) If a person is unable to submit a petition for reconsideration within twenty (20) working days of receiving notice that a claim for confidential treatment was denied, that person may submit a request for an extension of time. The Chief Counsel must receive any request for an extension of time before the date on which the information would be made available to the public, and the request must be accompanied by an explanation describing the reason for the request and the length of time requested. The Chief Counsel will determine whether to grant or deny the extension and the length of the extension.

(c) If a petition for reconsideration is granted, the petitioner will be notified in writing of the determination and of any appropriate limitations.

(d) If a petition for reconsideration is denied in whole or in part, or if a request for an extension is denied, the petitioner will be notified in writing of the denial, and the reasons for the denial, and will be informed that the information will be made available to the public not less than twenty (20) working days after the petitioner has received notice of the denial. The information may be released publicly on an earlier date, if the Administrator determines in writing that the public interest requires that the information be made available to the public on such date.

Subpart E—Agency Treatment of Information Claimed To Be Confidential

§ 512.20 How does the agency treat information submitted pursuant to this part before a confidentiality determination is made?

(a) Information received by NHTSA, for which a properly filed confidentiality request is submitted, will be kept confidential until the Chief Counsel makes a determination regarding its confidentiality. Such information will not be disclosed publicly, except in accordance with this part.

(b) Redacted copies of documents submitted to NHTSA under this part will be disclosed to the public.

§ 512.21 How is information submitted pursuant to this part treated once a confidentiality determination is made?

(a) Once the Chief Counsel makes a determination regarding the confidentiality of the submitted information, all materials determined not to be entitled to confidential protection will be disclosed to the public in accordance with the determination, unless a timely petition for reconsideration is received by the agency.

(b) Upon receipt of a timely petition for reconsideration under § 512.19 of this part, the submitted information will remain confidential, pending a determination regarding the petition.

(c) Should the Chief Counsel, after considering a petition for reconsideration, decide that information is not entitled to confidential treatment, the agency may make the information available after twenty (20) working days after the submitter has received notice of that decision from the Chief Counsel unless the agency receives direction from a court not to release the information.

§ 512.22 Under what circumstances may NHTSA modify a grant of confidentiality?

(a) The Chief Counsel may modify a grant of confidentiality based upon:

1. Newly discovered or changed facts;
Nat’l Highway Traffic Safety Admin., DOT § 512.23

(2) A change in the applicable law;
(3) A change in class determination, pursuant to §512.16;
(4) The passage of time; or
(5) A finding that the prior determination is erroneous.

(b) If the Chief Counsel believes that an earlier determination of confidentiality should be modified based on one or more of the factors listed in paragraph (a) of this section, the submitter of the information will be notified in writing that the Chief Counsel has modified its earlier determination and of the reasons for the modification, and will be informed that the information will be made available to the public in not less than twenty (20) working days from the date of receipt of the notice of modification. The information may be released publicly on an earlier date, if the Administrator determines in writing that the public interest requires that the information be made available to the public on such date. The submitter may seek reconsideration of the modification, pursuant to §512.19.

§ 512.23 Under what circumstances may NHTSA publicly release confidential information?

(a) Information that has been claimed or determined to be confidential under this part may be disclosed to the public by the Administrator notwithstanding such claim or determination, if disclosure would be in the public interest as follows:

1. Information obtained under chapter 325, 327, 329 or 331 of title 49 of the United States Code (formerly under the Motor Vehicle Information and Cost Savings Act) may be disclosed when that information is relevant to a proceeding under the chapter under which the information was obtained.

2. Information obtained under chapter 301 of title 49 of the United States Code (49 U.S.C. §30101 et seq.), relating to the establishment, amendment, or modification of Federal motor vehicle safety standards, may be disclosed when relevant to a proceeding under the chapter.

3. Except as specified in the next sentence, information obtained under Chapter 301 of title 49 of the United States Code (49 U.S.C. 30101 et seq.), related to a possible defect or noncompliance, shall be disclosed when the Administrator decides the information will assist in carrying out sections 30117(b) and 30118 through 30121 of title 49 or is required to be disclosed under 30118(a) of title 49, except as provided in paragraph (a)(4) of this section.

4. No information will be disclosed under paragraph (a) of this section unless the submitter of the information is given written notice of the Administrator’s intention to disclose information under this section. Written notice will be given at least twenty (20) working days before the day of release, unless the Administrator finds that shorter notice is in the public interest. The notice under this paragraph will include a statement of the Administrator’s reasons for deciding to disclose the information, and will afford the submitter of the information an opportunity to comment on the contemplated release of the information. The Administrator may also give notice of the contemplated release of information to other persons and may allow these persons the opportunity to comment. In making the determination to release information pursuant to this section, the Administrator will consider ways to release the information that will cause the least possible adverse effects to the submitter.

(b) Notwithstanding any other provision of this part, information that has been determined or claimed to be confidential may be released:

1. To a committee of Congress;
2. Pursuant to an order of a court of competent jurisdiction;
3. To the Office of the Secretary, U.S. Department of Transportation and other Executive branch offices or other Federal agencies in accordance with applicable laws;
4. With the consent of the submitter of the information; and
5. To contractors, if necessary for the performance of a contract with the agency or any Federal agency, with specific prohibitions on further release of the information.
Pt. 512, App. A

APPENDIX A TO PART 512—CERTIFICATE IN SUPPORT OF REQUEST FOR CONFIDENTIALITY

Certificate in Support of Request for Confidentiality

I __________, pursuant to the provisions of 49 CFR part 512, state as follows:

(1) I am (official’s name, title) and I am authorized by (company) to execute this certificate on its behalf;

(2) I certify that the information contained in (pertinent document(s)) is confidential and proprietary data and is being submitted with the claim that it is entitled to confidential treatment under 5 U.S.C. 552(b)(4) (as incorporated by reference in and modified by the statute under which the information is being submitted);

(3) I hereby request that the information contained in (pertinent document(s)) be protected for (requested period of time);

(4) This certification is based on the information provided by the responsible (company) personnel who have authority in the normal course of business to release the information for which a claim of confidentiality has been made to ascertain whether such information has ever been released outside (company); (except as hereinafter specified);

(5) Based upon that information, to the best of my knowledge, information and belief, the information for which (company) has claimed confidential treatment has never been released or become available outside (company); (except as hereinafter specified);

(6) I make no representations beyond those contained in this certificate and, in particular, I make no representations as to whether this information may become available outside (company) because of unauthorized or inadvertent disclosure (except as stated in paragraph 5); and

(7) I certify under penalty of perjury that the foregoing is true and correct. Executed on this the ______ day of ______, ______. (If executed outside of the United States of America: I certify under penalty of perjury under the laws of the United States of America that the foregoing is true and correct). (signature of official)

APPENDIX B TO PART 512—GENERAL CLASS DETERMINATIONS

The Chief Counsel has determined that the following types of information would presumptively be likely to result in substantial competitive harm if disclosed to the public:

(1) Blueprints and engineering drawings containing process and production data where the subject could not be manufactured without the blueprints or engineering drawings except after significant reverse engineering;

(2) Future specific model plans (to be protected only until the date on which the specific model to which the plan pertains is first offered for sale); and

(3) Future vehicle production or sales figures for specific models (to be protected only until the termination of the production period for the model year vehicle to which the information pertains).

APPENDIX C TO PART 512—EARLY WARNING REPORTING CLASS DETERMINATIONS

(a) The Chief Counsel has determined that the following information required to be submitted to the agency under 49 CFR 579, Subpart C, if released, is likely to cause substantial harm to the competitive position of the manufacturer submitting the information and is likely to impair the government’s ability to obtain necessary information in the future:

(1) Reports and data relating to warranty claim information and warranty adjustment information for manufacturers of tires;

(2) Reports and data relating to field reports, including dealer reports, product evaluation reports, and hard copies of field reports; and

(3) Reports and data relating to consumer complaints.

(b) The Chief Counsel has determined that the following information required to be submitted to the agency under 49 CFR 579, Subpart C, if released, is likely to cause substantial harm to the competitive position of the manufacturer submitting the information:

(1) Reports of production numbers for child restraint systems, tires, and vehicles other than light vehicles, as defined in 49 CFR 579.4(c); and

(2) Lists of common green tire identifiers.

[72 FR 59470, Oct. 19, 2007]

APPENDIX D TO PART 512—VEHICLE IDENTIFICATION NUMBER INFORMATION

The Chief Counsel has determined that the disclosure of the last six (6) characters, when disclosed along with the first eleven (11) characters, of vehicle identification numbers reported in information on incidents involving death or injury pursuant to the early warning information requirements of 49 CFR part 579 will constitute a clearly unwarranted invasion of personal privacy within the meaning of 5 U.S.C. 552(b)(6).

[72 FR 59470, Oct. 19, 2007]
PART 520—PROCEDURES FOR CONSIDERING ENVIRONMENTAL IMPACTS

Subpart A—General

Sec.
520.1 Purpose and scope.
520.2 Policy.
520.3 Definitions.
520.4 Applicability.
520.5 Guidelines for identifying major actions significantly affecting the environment.

Subpart B—Procedures

520.21 Preparation of environmental reviews, negative declarations, and notices of intent.
520.22 Maintenance of a list of actions.
520.23 Preparation of draft environmental impact statements.
520.24 Internal processing of draft environmental impact statements.
520.25 External review of draft environmental impact statements.
520.26 Public hearings.
520.27 Legislative actions.
520.28 Preparation of final environmental impact statements.
520.29 Internal review of final environmental impact statements.
520.30 Availability of final environmental impact statements.
520.31 Amendments or supplements.
520.32 Emergency action procedures.
520.33 Timing of proposed NHTSA actions.
520.34 Comments on environmental statements prepared by other agencies.

(a) Section 102(2)(C) of the National Environmental Policy Act of 1969 (42 Stat. 853; 42 U.S.C. 4321(2)(C)) requires all agencies of the Federal Government to prepare environmental impact statements on proposals for legislation and other major Federal actions significantly affecting the quality of the human environment. The purpose of the Act is to build into the agency decision-making process careful consideration of all environmental aspects of proposed actions.

(b) This part specifies National Highway Traffic Safety Administration (NHTSA) procedures for conducting environmental assessments and reviews, and for the preparation of environmental impact statements on proposals for legislation and other major agency actions significantly affecting the quality of the human environment.

§ 520.2 Policy.

The agency will strive to carry out the full intent and purpose of the National Environmental Policy Act of 1969 and related orders and statutes, and take positive steps to avoid any action which could adversely affect the quality of the human environment.

§ 520.3 Definitions.

(a) Environmental assessment is a written analysis describing the environmental impact of a proposed or ongoing agency action, submitted to the agency either by its grantees or contractors, or by any person outside the agency as part of any program or project proposal within the scope of activities listed in §520.4(b).

(b) Environmental review is a formal evaluation undertaken by the agency, culminating in a brief document (the
environmental review report), to determine whether a proposed or ongoing NHTSA action may have a significant impact on the environment. The review document will be included in the proposed or ongoing agency action, and either support a negative declaration or recommend the preparation of a draft environmental impact statement.

(c) Draft environmental impact statement (DEIS) means a preliminary statement on the environmental impact of a proposed or ongoing NHTSA action which is circulated for comment and review within and outside NHTSA.

(d) Final environmental impact statement (FEIS) means a detailed statement which, pursuant to section 102(2)(C) of the National Environmental Policy Act, identifies and analyzes the anticipated environmental impact of a proposed or ongoing NHTSA action.

(e) Negative declaration means a statement prepared subsequent to an environmental review, which states that a proposed or ongoing NHTSA action will have no significant environmental impact and therefore does not require a draft or final environmental impact statement.

§ 520.4 Applicability.

(a) Scope. This part applies to all elements of NHTSA, including the Regional Offices.

(b) Actions covered. Except as provided in paragraph (e) of this section, this part applies to the following agency actions and such actions and proposals as may be sponsored jointly with another agency:

(1) New and continuing programs and projects; budget proposals; legislative proposals by the agency; requests for appropriations; reports on legislation initiated elsewhere where the agency has primary responsibility for the subject matter involved; and any renewals or reapprovals of the foregoing;

(2) Research, development, and demonstration projects; formal approvals of work plans; and associated contracts;

(3) Rulemaking and regulatory actions, including Notices of Proposed Rulemaking (NPRM); requests for procurement (RFP); requests for grants (Annual Work Programs); and contracts;

(4) All grants, loans or other financial assistance for use in State and Community projects;

(5) Annual State Highway Safety Work Programs;

(6) Construction; leases; purchases; operation of Federal facilities; and

(7) Any other activity, project, or action likely to have a significant effect on the environment.

(c) Continuing actions. This part applies to any action enumerated in paragraph (b) of this section, even though such actions arise from a project or program initiated prior to enactment of the National Environmental Policy Act on January 1, 1970.

(d) Environmental assessments. Within the scope of activities listed in § 520.4(b), any person outside the agency submitting a program or project proposal may be requested to prepare an environmental assessment of such proposed action to be included in his submission to the agency.

(e) Exceptions. (1) Assistance in the form of general revenue sharing funds, distributed under the State and Local Fiscal Assistance Act of 1972, 31 U.S.C. 1221, with no control by the NHTSA over the subsequent use of such funds;

(2) Personnel actions;

(3) Administrative procurements (e.g., general supplies) and contracts for personal services;

(4) Legislative proposals originating in another agency and relating to matters not within NHTSA’s primary areas of responsibility;

(5) Project amendments (e.g., increases in costs) which have no environmental significance; and

(6) Minor agency actions that are determined by the official responsible for the actions to be of such limited scope that they clearly will not have a significant effect on the quality of the human environment.

(f) Consolidation of statements. Proposed actions (and alternatives thereof) having substantially similar environmental impacts may be covered by a single environmental review and environmental impact statement or negative declaration.
§ 520.5 Guidelines for identifying major actions significantly affecting the environment.

(a) General guidelines. The phrase, “major Federal actions significantly affecting the quality of the human environment,” as used in this part, shall be construed with a view to the overall, cumulative impact of the actions, other Federal projects or actions in the area, and any further contemplated or anticipated actions. Therefore, an environmental impact statement should be prepared in any of the following situations:

(1) Proposed actions which are localized in their impact but which have a potential for significantly affecting the environment;

(2) Any proposed action which is likely to be controversial on environmental grounds;

(3) Any proposed action which has unclear but potentially significant environmental consequences.

(b) Specific guidelines. While a precise definition of environmental significance that is valid in all contexts is not possible, any of the following actions should ordinarily be considered as significantly affecting the quality of the human environment:

(1) Any matter falling under section 4(f) of the Department of Transportation Act (49 U.S.C. 1653(f)) and section 138 of Federal-aid highway legislation (23 U.S.C. 138), requiring the use of any publicly owned land from a park, recreation area, or wildlife and waterfowl refuge of national, State, or local significance as determined by the Federal, State, or local officials having jurisdiction thereof, or any land from an historic site of national, State, or local significance;

(2) Any matter falling under section 106 of the National Historic Preservation Act of 1966 (16 U.S.C. 470(f)), requiring consideration of the effect of the proposed action on any building included in the National Register of Historic Preservation and reasonable opportunity for the Advisory Council on Historic Preservation to comment on such action;

(3) Any action that is likely to affect the preservation and enhancement of sites of historical, architectural, or archaeological significance;

(4) Any action that is likely to be highly controversial regarding relocation housing;

(5) Any action that (i) divides or disrupts an established community, disrupts orderly, planned development, or is inconsistent with plans or goals that have been adopted by the community in which the project is located; or (ii) causes significantly increased congestion;

(6) Any action that (i) involves inconsistency with any Federal, State, or local law or administrative determination relating to the environment; (ii) has a significantly detrimental impact on air or water quality or on ambient noise levels for adjoining areas; (iii) involves a possibility of contamination of a public water supply system; or (iv) affects ground water, flooding, erosion, or sedimentation;

(7) Any action that may directly or indirectly result in a significant increase in noise levels, either within a motor vehicle’s closed environment or upon nearby areas;

(8) Any action that may directly or indirectly result in a significant increase in the energy or fuel necessary to operate a motor vehicle, including but not limited to the following: (i) Actions which may directly or indirectly result in a significant increase in the weight of a motor vehicle; and (ii) actions which may directly or indirectly result in a significant adverse effect upon the aerodynamic drag of a motor vehicle;

(9) Any action that may directly or indirectly result in a significant increase in the amount of harmful emissions resulting from the operation of a motor vehicle;

(10) Any action that may directly or indirectly result in a significant increase in either the use of or the exposure to toxic or hazardous materials in the manufacture, operation, or disposal of motor vehicles or motor vehicle equipment;

(11) Any action that may directly or indirectly result in a significant increase in the problem of solid waste, as in the disposal of motor vehicles or motor vehicle equipment;
(12) Any action that may directly or indirectly result in a significant deple-
tion of scarce natural resources associated with the manufacture or opera-
tion of motor vehicles or motor vehicle equipment; and
(13) Any other action that causes significant environment impact by di-
rectly or indirectly affecting human beings through adverse impacts on the
environment.

(c) Research activities. (1) In accord-
ance with DOT Order 5610.1B, the As-
sistant Secretary for Systems Develop-
ment and Technology (TST) will pre-
pare, with the concurrence of the
NHTSA, proposed procedures for as-
sessing the environmental con-
sequences of research activities. Until
final procedures are promulgated, the
following factors are to be considered
for periodic evaluation to determine
when an environmental statement is
required for such programs:

(i) The magnitude of Federal invest-
ment in the program;

(ii) The likelihood of widespread ap-
plication of the technology;

(iii) The degree of environmental im-
 pact which would occur if the tech-
nology were widely applied; and

(iv) The extent to which continued
investment in the new technology is
likely to restrict future alternatives.

(2) The statement or environmental
review culminating in a negative de-
claration must be written late enough
in the development process to contain
meaningful information, but early
enough so that this information can
practically serve as an input in the de-
cision-making process. Where it is an-
ticipated that an environmental im-
pact statement may ultimately be re-
quired but its preparation is still pre-
mature, the office shall prepare a pub-
licly available record briefly setting
forth the reasons for its determination
that a statement is not yet necessary.
This record shall be updated at least
quarterly, or as may be necessary when
significant new information becomes
available concerning the potential en-
vironmental impact of the program. In
any case, a statement or environ-
mental review culminating in a nega-
tive declaration must be prepared be-
fore research activities have reached a
state of investment or commitment to
implementation likely to determine
subsequent development or restrict
later alternatives. Statements on tech-
nology research and development pro-
grams shall include an analysis not
only of alternative forms of the same
technology that might reduce any ad-
verse environmental impacts but also
of alternative technologies that would
serve the same function as the tech-
nology under consideration. Efforts
shall be made to involve other Federal
agencies and interested groups with
relevant expertise in the preparation of
such statements because the impacts
and alternatives to be considered are
likely to be less well defined than in
other types of statements.

Subpart B—Procedures

§ 520.21 Preparation of environmental
reviews, negative declarations, and
notices of intent.

(a) General responsibilities—(1) Asso-
ciate Administrators and Chief Counsel.
Each Associate Administrator and the
Chief Counsel is responsible for deter-
mining, in accordance with Subpart A,
whether the projects and activities
under his jurisdiction require an en-
vironmental review, and for prepare-
ing all such reviews, negative declara-
tions, and notices of intent.

(2) Regional Administrators. Each Re-
gional Administrator, in consultation
with the Governor’s Representative, is
responsible for determining, in accord-
ance with Subpart A, whether proposed
State activities in his Region, as stated
in Annual Work Programs, require an
environmental review, and for pre-
paring all such reviews, negative declara-
tions, and notices of intent.

(3) Associate Administrator for Plan-
ning and Evaluation. The Associate Ad-
mnistrator for Planning and Evalua-
tion may request in accordance with
the requirements of this order, that the
appropriate Associate Administrator or
Regional Administrator prepare an En-
vironmental review or Environmental
Impact Statement for any proposed or
continuing NHTSA action, or comment
on any environmental statement pre-
pared by other agencies.

(b) Coordination. Coordination with
appropriate local, State and Federal

72
agencies should be accomplished during the early stages by the responsible official to assist in identifying areas of significance and concern. Existing procedures, including those established under the Office of Management and Budget (OMB) Revised Circular A–95, should be used to the greatest extent practicable to accomplish this early coordination.

(c) Applicants. (1) Each applicant for a grant, loan, or other financial assistance for use in State and community projects may be requested to submit, with the original application, an environmental assessment of the proposed project.

(2) Under OMB Revised Circular A–95, “Evaluation, Review, and Coordination of Federal Assistance Programs and Projects,” and DOT 4600.4B, “Evaluation, Review and Coordination of DOT Assistance Programs and Projects,” dated February 27, 1974, a grant applicant must notify the clearinghouse of its intention to apply for Federal program assistance. The notification must solicit comments on the project and its impacts from appropriate State and local agencies. Since it is the NHTSA’s policy to assure that (i) interested parties and Federal, State, and local agencies receive early notification of the decision to prepare an environmental impact statement, and (ii) their comments on the environmental effects of the proposed Federal action are solicited at an early stage in the preparation of the draft impact statement, this early notification requirement may be met by a grant applicant by sending the notification to interested parties and agencies at the same time it is sent to the clearinghouse.

(d) Consultants. Consultants may prepare background or preliminary material and assist in preparing a draft or final environmental statement for which the NHTSA takes responsibility. Care should be exercised in selecting consultants, and in reviewing their work, to insure complete and objective consideration of all relevant project impacts and alternatives, particularly if the consultant may expect further contracts based on the outcome of the environmental decision.

(e) Environmental review report. The environmental review shall culminate in a brief written report of the same title, which shall be included in the proposed or ongoing agency action, and which:

(1) Describes the proposed or ongoing NHTSA action, the environment affected, and the anticipated benefits;

(2) Evaluates the potential environmental impact, including those adverse impacts which cannot be avoided, should the proposal be implemented or the action continued;

(3) Assesses the alternatives to the proposed or ongoing action and their potential environmental impact;

(4) Evaluates the cumulative and long-term environmental effects of the proposed or ongoing action;

(5) Describes the irreversible and ir-retrievable commitments of resources involved in the proposal’s implementation or the action’s continuance;

(6) Identifies any known or potential conflicts with State, regional, or local plans and programs;

(7) Weighs and analyzes the anticipated benefits against the environmental and other costs of the proposed or ongoing action in a manner which reflects similar comparisons of reasonably available alternatives; and

(8) Concludes with a negative declaration or recommends the preparation of a DEIS.

(f) Negative declarations. (1) If the responsible official judges that the environmental impact of a proposed or ongoing action under his jurisdiction will not significantly affect the quality of the human environment, the following declaration will be included in the environmental review report:

It is the judgment of this agency, based on available information, that no significant environmental impact will result from execution of this action.

(2) A DEIS may be changed to a negative declaration if the public review process indicates that the proposal or ongoing action will not have a significant effect upon the environment.

(3) An index of all negative declarations and a copy of each environmental review report shall be retained by the responsible official under whose jurisdiction it was prepared and shall be made available for public inspection upon request.
§ 520.22 Notice of intent to prepare a draft environmental impact statement.

If the responsible official under whose jurisdiction an environmental review is prepared determines that the proposed or ongoing action could have a potentially significant effect on the quality of the environment, he shall: coordinate with the Associate Administrator for Planning and Evaluation and the Chief Counsel, transmit to appropriate Federal, State and local agencies and have published in the Federal Register a notice of intent to prepare an environmental statement as soon as is practicable after the determination to prepare such a statement.

§ 520.22 Maintenance of a list of actions.

(a) The Associate Administrator for Planning and Evaluation shall be responsible for the preparation and maintenance of a list of actions for which draft or final environmental impact statements have been or are to be prepared. This list shall be on file with the Associate Administrator for Planning and Evaluation and shall be available for public inspection in the Docket Section upon request. A copy of the initial list and its updatings at the end of each calendar quarter shall be transmitted by the Associate Administrator for Planning and Evaluation to TES and CEQ.

(b) If a determination is made that an environmental statement is not necessary for a proposed action (1) which has been identified as normally requiring preparation of a statement, (2) which is similar to actions for which a significant number of statements have been prepared, (3) which the agency has previously announced would be the subject of a statement, or (4) for which the official responsible for such proposal has made a negative determination in response to a request from the CEQ, a record briefly setting forth the decision and the reasons for that determination shall be prepared by the responsible official. Such a record of negative determinations and any evaluations made pursuant to §520.21 which conclude that preparation of a statement is not yet timely shall be prepared by the responsible official, submitted to the Associate Administrator for Planning and Evaluation, and made available by the Associate Administrator for Planning and Evaluation in the same manner as provided in paragraph (a) of this section for lists of statements under preparation.

§ 520.23 Preparation of draft environmental impact statements.

(a) Planning stage. (1) When a DEIS is to be prepared, the responsible official shall promptly initiate its preparation and develop a schedule in consultation with the Associate Administrator for Planning and Evaluation, to assure completion prior to the first significant point of decision in the program or project development process.

(2) The environmental impacts of proposed activities should be initially assessed concurrently with the initial technical and economic studies.

(3) Section 102(2)(A) of NEPA requires each Federal agency to utilize a “systematic, interdisciplinary approach” to plans and programs affecting the environment. To assure that all environmental impacts are identified and assessed, all relevant disciplines should be represented. If the necessary disciplines are not represented on the staff of the applicant or NHTSA, it is appropriate to use professional services available in other Federal, State or local agencies, universities, or consulting firms. The use of the interdisciplinary approach should not be limited to the environmental statement. This approach should also be used in the early planning stages to help assure a systematic evaluation of reasonable alternative courses of action and their potential social, economic, and environmental consequences.

(b) Form and content requirements. Attachment 1 of this order prescribes the form and content requirements to be followed for each draft and final environmental impact statement. The DEIS must fulfill and satisfy, to the fullest extent possible at the time it is prepared, the requirements established for final statements.

(c) Lead agency. CEQ guidelines provide that when more than one Federal agency (1) directly sponsors an action, or is directly involved in an action through funding, licenses, or permits,
or (2) is involved in a group of actions directly related to each other because of their functional interdependence and geographical proximity, consideration should be given to preparing one statement for all the Federal actions involved. Agencies in such cases should consider the designation of a single “lead agency” to assume supervisory responsibility for preparation of a joint statement. Where a lead agency prepares the statement, the other agencies involved should provide assistance with respect to their areas of jurisdiction and expertise. The statement should contain an evaluation of the full range of Federal actions involved, should reflect the views of all participating agencies, and should be prepared before major or irreversible actions have been taken by any of the participating agencies. Some relevant factors in determining an appropriate lead agency are: The time sequence in which the agencies become involved, the magnitude of their respective involvement, and their relative expertise with respect to the project’s environmental effects. Questions concerning “lead agency” decisions should be raised with CEQ through TES. For projects serving and primarily involving land owned by or under the jurisdiction of another Federal agency, that agency may be the appropriate lead agency.

(d) Applicants. Where the agency requests an applicant for financial assistance or other agency approval to submit an environmental assessment, the responsible official will (1) assist the applicant by outlining the information required, and (2) in all cases make his own evaluation of the environmental issues involved and take responsibility for the scope and content of draft and final environmental statements.

§ 520.25 External review of draft environmental impact statements.

(a) Requirements. The official responsible for the DEIS shall:

(1) Transmit 5 copies of the DEIS to the CEQ and 2 copies to TES;

(2) Solicit comments from all Federal, State, and local agencies which have jurisdiction by law or special expertise with respect to the possible environmental impact involved, and from the public (see Attachment 2); and

(3) Inform the public and interested parties of the availability of the DEIS and provide copies as appropriate; and

(4) Allow a comment period of not less than 45 days from the Friday of the week following receipt of the draft impact statement by CEQ. Requests for extensions shall be granted whenever possible, and particularly when warranted by the magnitude and complexity of the statement or the extent of citizen interest.

(b) Procedures—(1) Federal and Federal-State agency review. (i) The DEIS shall be circulated for review to the Federal and Federal-State agencies with special expertise or jurisdiction by law with regard to the potential environmental impact involved. These agencies and their relevant areas of expertise are identified in Attachment 2.

(ii) For actions within the jurisdiction of the Environmental Protection Agency (air or water quality, solid wastes, pesticides, radiation standards, noise), the DEIS shall be sent to EPA.

(iii) For actions which would affect any property that is included in the National Register of Historic Preservation, the DEIS should be sent to the

1Filed as part of the original document.
Advisory Council on Historic Preservation and the State Liaison Office for Historic Preservation.

(2) State and local review. Where a review of the proposed action by State and local agencies authorized to develop and enforce environmental standards is relevant, comments are to be solicited directly from such agencies with known responsibilities in environmental matters, and shall be obtained as follows:

(i) Where review of direct Federal development projects, and of projects assisted under programs listed in Attachment D to revised OMB Circular A-95 (as implemented by DOT 4600.4B “Evaluation, Review and Coordination of DOT Assistance Programs and Projects”, dated February 27, 1974), takes place prior to preparation of an environmental statement, comments of the reviewing agencies on the environmental effects of the proposed project are inputs to the environmental statement. These comments shall be attached to the draft statement when it is circulated for review and copies of the draft shall be sent to those who commented. A-95 clearinghouses or other agencies designated by the Governor may also secure comments on environmental statements. In all cases, copies of the draft environmental statements shall be sent to clearinghouses and to the applicant whose project is the subject of the statement.

(ii) Comments shall be obtained from appropriate State and local agencies, except where review is secured by agreement through A-95 clearinghouses, unless the Governor of the appropriate State has designated some other point for obtaining his review. Instructions for obtaining the views of such agencies are contained in the joint OMB-CEQ memorandum (see Attachment 4). Comments shall be solicited from municipalities and counties on all projects located therein.

(iii) State and local review of NHTSA procedures, regulations, and policies for administering Federal programs of assistance to State and local governments shall be obtained pursuant to procedures established by OMB Circular No. A-85.

(iv) Generally, environmental statements on legislative and budget proposals may be excluded from State and local review.

(3) General public review. (i) At the time the DEIS is circulated to Federal, State, and local agencies, public availability of the DEIS for comment and review will be announced by the CEQ in the Federal Register. Copies of the DEIS should be sent to known interested parties, and press releases should be sent to local news media advising where the DEIS is available and how copies may be obtained. The Office of Public Affairs and Consumer Services shall maintain a list of groups, including conservation organizations and motor vehicle manufacturers, known to be interested in the agency’s activities, and directly notify such groups of the availability of the DEIS or send them a copy as soon as it has been prepared.

(ii) A DEIS should be available to the public at least 30 days prior to the time of a public hearing on the DEIS.

(iii) Copies of the DEIS will be made available at the NHTSA Docket Section, Room 5109, 400 Seventh Street, SW., Washington, DC 20590, and, where appropriate, NHTSA Regional Offices, at the offices of any applicants or grantees, at appropriate State, regional, and metropolitan clearinghouses, and local public libraries, and furnished to public and private organizations and individuals with special expertise with respect to the potential environmental impact involved, and to those with an interest in the action who request an opportunity to comment. Copies to be made available to the public shall be provided without charge to the extent practicable, or at a fee which is not more than the actual cost of reproducing copies required to be sent to other Federal agencies, including the CEQ.

(iv) A copy of the DEIS should in all cases be sent to any applicant whose project is the subject of the statement.

(v) If a DEIS is changed to a negative declaration as a result of the public review process, all agencies and individuals that received copies and/or commented on the DEIS must be informed that a negative declaration was substituted for the DEIS and given a brief explanation of the reason for such substitution.
(c) Utilization of comments. Comments received on the draft statement, and inputs (in summary form, if appropriate) from the processes for citizen participation, shall accompany the environmental statement through the normal internal project or program review process.

§ 520.26 Public hearings.

(a) A public hearing on a proposed or ongoing action covered by a DEIS shall be held upon the determination by the official responsible for such action, in consultation with the Associate Administrator for Planning and Evaluation, that a public hearing would be appropriate and in the public interest. In deciding whether a public hearing is appropriate, the responsible official should consider:

(1) The magnitude of the proposal in terms of economic costs, the geographic area involved, and the uniqueness or size of the commitment of the resources involved;

(2) The degree of interest in the proposal, as evidenced by requests from the public and from Federal, State, and local authorities that a hearing be held;

(3) The likelihood that information will be presented at the hearing which will be of assistance to the agency in fulfilling its responsibilities under the NEPA;

(4) The extent to which public involvement already has been achieved through other means, such as earlier public hearings, meetings with citizen representatives, and/or written comments on the proposed action; and

(5) The extent of potential environmental impact.

(b) If it is determined that a public hearing is to be held in accordance with paragraph (a) of this section, the official responsible for the action shall both announce the hearing through newspaper articles, direct notification to interested parties, and clearinghouses, and cause a notice to be issued in the Federal Register at least 30 days prior to the time of such hearing:

(1) Identifying the subject matter of the hearing;

(2) Announcing the date, time, and place of the hearing and the procedures to be followed; and

(3) Announcing the availability of the DEIS and any other information, as appropriate, for public inspection at one or more locations in the area affected by the action.

§ 520.27 Legislative actions.

(a) A DEIS on both legislative proposals and reports for which NHTSA either develops the Departmental position or originates the legislation will be cleared with TES, filed with CEQ, and submitted to the Office of Management and Budget through the normal DOT and NHTSA legislative process.

(b) The preparation, circulation, and filing of the environmental statement shall be in accordance with OMB Bulletin 72-6, “Proposed Federal Actions Affecting the Environment.”

(c) A DEIS and any comments that have been received should be available to the Congress and to the public for consideration in connection with the proposed legislation or report on proposed legislation. In cases where the scheduling of Congressional hearings on recommendations or reports on proposals for legislation which the Department has forwarded to the Congress does not allow adequate time for the completion of a FEIS, a DEIS may be furnished to the Congress and made available to the public pending transmittal of the comments as received and the final text.

§ 520.28 Preparation of final environmental impact statements.

(a) If the action is to go forward and the DEIS has not been changed to a negative declaration, as soon as practicable after the expiration of the comment period and hearing process, if any, the official responsible for the action shall prepare a final environmental impact statement (FEIS), taking into account all comments received and issues raised during such period and process.

(b) The FEIS shall conform to the guidelines for form and content in Attachment I.

(c) The FEIS shall then be submitted to the Chief Counsel by the official responsible for the action, for determination of legal sufficiency.
§ 520.29 Internal review of final environmental impact statements.

(a) Upon completion of the review for legal sufficiency of the FEIS, the Chief Counsel shall transmit 2 copies of the FEIS to TES for concurrence. Unless other notification is provided within 2 weeks after receipt in TES, the statement will be considered concurred in by TES.

(b) After concurrence by TES, the FEIS will be transmitted by the Chief Counsel to the Administrator for approval.

(c) If an action requires the personal approval of the Secretary or Deputy Secretary pursuant to a request by them or by TES, TGC, or the NHTSA office originating the action, the final environmental statement shall be accompanied by a brief cover memorandum requesting the Secretary’s or Deputy Secretary’s approval of the action.

(1) The memorandum shall have signature lines for the concurrence of the Assistant Secretary for Environment, Safety, and Consumer Affairs, the General Counsel, and the Deputy Secretary, and for the approval of the Secretary or Deputy Secretary.

(2) TES, in conjunction with the Executive Secretary, is responsible for informing the Assistant Secretary for Congressional and Intergovernmental Affairs and the Office of Public Affairs of the Secretary’s decisions so that they, in coordination with the operating administrations or other Secretarial Offices involved, may take the appropriate actions.

§ 520.30 Availability of final environmental impact statements.

(a) Pending final approval and filing with CEQ, a proposed FEIS may be made available to the public and Federal, State, or local agencies if it carries a notation that it is not approved and filed.

(b) After approval by the Administrator, the Associate Administrator for Planning and Evaluation will send 5 copies of the FEIS (together with comments) to the CEQ; individual copies with comments attached to the EPA and all Federal, State, and local agencies and members of the public who submitted comments on the DEIS or requested copies of the FEIS. If the length of the statement or the number of comments make this distribution requirement highly impractical, TES should be consulted to consider an alternative arrangement.

(c) Copies of the FEIS will be made available in the NHTSA Docket Section, Room 5109, 400 Seventh Street SW., Washington, DC 20590, and, where appropriate, NHTSA Regional Offices, at the offices of any applicants or grantees, and at appropriate State, regional, and metropolitan clearinghouses and, where the impact is localized, public libraries.

(d) The official responsible for the action shall, upon request, make available copies of the FEIS and substantive comments received on the DEIS without charge to the extent practicable, or at a fee which is not more than the actual cost of reproducing copies.

§ 520.31 Amendments or supplements.

A draft or final environmental impact statement may be amended or supplemented. Supplements or amendments should be considered when substantial changes are made in the proposed or ongoing action that will introduce a new or changed environmental effect of significance to the quality of the environment, or significant new information becomes available concerning its environmental aspects. In such cases, the supplement or amendment shall be processed in consultation with TES with respect to the need for, or desirability of, recirculating the statement for the appropriate period. TES concurrence must be secured before issuance.

§ 520.32 Emergency action procedures.

The CEQ Guidelines allow modification of requirements in case of a national emergency, a disaster or similar great urgency. The processing times may be reduced, or if the emergency
situation warrants, preparation and processing of a DEIS, FEIS, or negative declaration may be abbreviated. Such procedural changes, however, should be requested only for those projects where the need for immediate action requires processing in other than the normal manner.

§ 520.33 Timing of proposed NHTSA actions.

To the maximum extent practicable, no administrative action (i.e., any proposed action to be taken by the agency other than agency proposals for legislation to Congress, budget proposals, or agency reports on legislation) subject to this part and covered by an environmental impact statement shall be taken sooner than 90 days after a DEIS has been circulated for comment, furnished to the CEQ, and made public. Neither shall such administrative action be taken sooner than 30 days after the FEIS (together with comments) has been filed with CEQ, and made available to commenting agencies and the public. If the FEIS is filed within 90 days after a DEIS has been circulated for comment, furnished to the CEQ and made public, the 30-day period may run concurrently to the extent that they overlap. The 90-day time period is measured from the date of publication in the FEDERAL REGISTER of the list of weekly filings of environmental impact statements with the CEQ, but the 30-day period is computed from the date of receipt by the CEQ.

§ 520.34 Comments on environmental statements prepared by other agencies.

(a) All requests for NHTSA's views on a DEIS or a proposed action undergoing environmental review by another agency will be transmitted to the Associate Administrator for Planning and Evaluation for action or referral to TES where appropriate. Offices within NHTSA may be requested by the Associate Administrator for Planning and Evaluation to supply any pertinent information and comments for a coordinated agency response.

(b) NHTSA's comments and the comments of any offices responding to a request by the Associate Administrator for Planning and Evaluation should be organized in a manner consistent with the structure of an environmental review set out in §520.21(e). NHTSA programs that are environmentally related to the proposed action under review should be identified so interrelationships may receive due consideration.

(c) Copies of NHTSA's comments on environmental statements prepared by other agencies shall be distributed as follows:

(1) The original and 1 copy to the requesting agency;
(2) 1 copy to TES-70; and
(3) 5 copies to CEQ.

(d) Requests by the public for copies should be referred to the agency originating the statement.

ATTACHMENT 1—FORM AND CONTENT OF STATEMENT

1. Form.
   a. Each statement will be headed as follows:
   DEPARTMENT OF TRANSPORTATION
   NATIONAL HIGHWAY TRAFFIC SAFETY ADMINISTRATION
   (Draft) Environmental Impact Statement
   b. The heading specified above shall be modified to indicate that the statement also covers sections 4(f) of the DOT Act or 106 of the National Historic Preservation Act, when appropriate.
   c. Each statement will, as a minimum, contain sections corresponding to paragraph 3 herein, supplemented as necessary to cover other matters provided in this Attachment.
   d. The format for the summary to accompany draft and final environmental statements is as follows:

   SUMMARY
   (Check one) ( ) Draft ( ) Final; Department of Transportation, National Highway Traffic Safety Administration. Name, address, and telephone number of individual who can be contacted for additional information about the proposed action or the statement. (Note: DOT Order 2100.2 prescribes procedures for reporting public contacts in rulemaking.)
   (1) Name of Action. (Check one) ( ) Administrative Action. ( ) Legislative Action.
   (2) Brief description of action indicating what States (and counties) are particularly affected.
   (3) Summary of environmental impact and adverse environmental effects.
   (4) List alternatives considered.
(6)(a) (For draft statements) List all Federal, State, and local agencies from which comments have been requested.

(b) (For final statements) List all Federal, State, and local agencies, and other sources from which written comments have been received.

(b) Dates the draft statement and the final statement if issued were made available to the Council on Environmental Quality and the public.

2. Guidance as to content of statement. The following paragraphs of this Attachment are intended to be considered, where relevant, as guidance regarding the content of environmental statements. This guidance is expected to be supplemented by research reports, guidance on methodology, and other material from the literature as may be pertinent to evaluation of relevant environmental factors.

3. General content. The following points are to be covered:

a. A description of the proposed Federal action (e.g., “The proposed Federal action is approval of a grant application to construct * * *”), a statement of its purpose, and a description of the environment affected, including information, summary technical data, and maps and diagrams where relevant, adequate to permit an assessment of potential environmental impact by commenting offices and the public.

b. The relationship of the proposed action and how it may conform to or conflict with adopted or proposed land use plans, policies, controls, and goals and objectives as have been promulgated by appropriate Federal, State, and local agencies. Where a conflict or inconsistency exists, the statement should describe the extent of reconciliation and the reasons for proceeding notwithstanding the absence of full reconciliation.

c. The probable impact of the proposed action on the environment. (1) This requires assessment of the positive and negative effects of the proposed action is it affects both national and international human environment. The attention given to different environmental factors will vary according to the nature, scale, and location of proposed actions. Among factors to be considered should be the potential effect of the action on such aspects of the environment as those listed in Attachment 2, and in section 520.5(b), supra.

(2) Secondary and other foreseeable effects, as well as primary consequences for the environment, should be included in the analyses. Secondary effects, such as the impact on fuel consumption, emissions, or noise levels of automobiles or in the use of toxic or scarce materials, may be more substantial than the primary effects of the original action.

d. Alternatives to the proposed action, including, where relevant, those not within the existing authority of the responsible preparing office. Section 102(2)(d) of NEPA requires the responsible agency to “study, develop, and describe appropriate alternatives to recommended courses of action in any proposal which involves unresolved conflicts concerning alternative uses of available resources.” A rigorous exploration and an objective evaluation of the environmental impacts of all reasonable alternative actions, particularly those that might enhance environmental quality or avoid some or all of the adverse environmental effects, are essential. Sufficient analysis of such alternatives and their environmental benefits, costs, and risks should accompany the proposed action through the review process in order not to foreclose prematurely options which might enhance environmental quality or have less
Natl' Highway Traffic Safety Admin., DOT
Pt. 520, Attch. 1

detrimental effects. Examples of such alternatives include: The alternatives of not taking any action or of postponing action pending further study; alternatives requiring actions of a significantly different nature which would provide similar benefits with different environmental impacts, e.g., low capital intensive improvements, mass transit alternatives to highway construction; alternatives related to different locations or designs or details of the proposed action which would present different environmental impacts. In each case, the analysis should be sufficiently detailed to reveal comparative evaluation of the environmental benefits, costs, and risks of the proposed action and each reasonable alternative. Where an existing impact statement already contains such an analysis its treatment of alternatives may be incorporated, provided such treatment is current and relevant to the precise purpose of the proposed action.

e. Any probable adverse environmental effects which cannot be avoided (such as water or air pollution, noise, undesirable land use patterns, or impacts on public parks and recreation areas, wildlife and waterfowl refuges, or on historic sites, damage to life systems, traffic congestion, threats to health, or other consequences adverse to the environmental goals set out in section 101(b) of NEPA). This should be a brief section summarizing in one place those effects discussed in paragraph 3c that are adverse and unavoidable under the proposed action. Included for purposes of contrast should be a clear statement of how all adverse effects will be mitigated. Where mitigating steps are included in the statement, the responsible official shall see that they are carried out.

f. The relationship between local short-term uses of man’s environment and the maintenance and enhancement of long-term productivity. This section should contain a brief discussion of the extent to which the proposed action involves tradeoffs between short-term environmental gains at the expense of long-term losses, or vice versa, and a discussion of the extent to which the proposed action forecloses future options.

g. Any irreversible and irretrievable commitments of resources that would be involved in the proposed action should be implemented. This requires identification of unavoidable impacts and the extent to which the action irreversibly curtails the range of potential uses of the environment. "Resources" means not only the labor and materials devoted to an action but also the natural and cultural resources lost or destroyed.

h. An indication of what other interests and considerations of Federal policy are thought to offset the adverse environmental effects of the proposed action identified pursuant to subparagraphs (c) and (e) of this paragraph. The statement should also indicate the extent to which these stated countervailing benefits could be realized by following reasonable alternatives to the proposed action (as identified in subparagraph (d) of this paragraph) that would avoid some or all of the adverse environmental effects. In this connection if a cost-benefit analysis of the proposed action has been prepared, it, or a summary, should be attached to the environmental impact statement, and should clearly indicate the extent to which environmental costs have not been reflected in such analysis.

i. A discussion of problems and objections raised by other Federal agencies, State and local entities, and citizens in the review process, and the disposition of the issues involved and the reasons therefor. (This section shall be added to the final environmental statement at the end of the review process.)

(1) The draft and final statements should document issues raised through consultations with Federal, State, and local agencies with jurisdiction or special expertise and with citizens, of actions taken in response to comments, public hearings, and other citizens involvement proceedings.

(2) Any unresolved environmental issues and efforts to resolve them, through further consultations or otherwise, should be identified in the final statement. For instance, where an agency comments that the statement has inadequate analysis or that the agency has reservations concerning the impacts, or believes that the impacts are too adverse for approval, either the issue should be resolved or the final statement should reflect efforts to resolve the issue and set forth any action that will result.

(3) The statement should reflect that every effort was made to discover and discuss all major points of view on the environmental effects of the proposed action and alternatives in the draft statement. However, where opposing professional views and responsible opinion have been overlooked in the draft statement and are raised through the commenting process, the environmental effects of the action should be reviewed in light of those views. A meaningful reference should be made in the final statement to the existence of any responsible opposing view not adequately discussed in the draft statement indicating responses to the issues raised.

(4) All substantive comments received on the draft (or summaries of responses from the public which have been exceptionally voluminous) should be attached to the final statement, whether or not each such comment is thought to merit individual discussion in the text of the statement.

j. Draft statement should indicate at appropriate points in the text any underlying
present in a particular case or the cost or lost unless there were truly unusual factors. Havens that are public parks were not to be given paramount importance. The few green park case, as follows:

Preme Court's statement in the Overton should demonstrate compliance with the Su-

magnitudes. This portion of the statement from alternative routes reach extraordinary

problem, and technical feasibility, and appropriate analyses of the alternatives, including any unique problems present and evidence that the cost or community disruption resulting from alternative routes reach extraordinary magnitudes. If the statutes are to have any meaning, the Secretary cannot approve the destruction of parkland unless he finds that alternative routes present unique problems. 401 U.S. 402, 412 (1971).

d. If there is no feasible and prudent alternative, description of all planning undertaken to minimize harm to the protected area and statement of actions taken or to be taken to implement this planning, including measures to maintain or enhance the natural beauty of the lands traversed.

(1) Measures to minimize harm may include replacement of land and facilities, providing land or facilities, provision for functional replacement of the facility (see 49 CFR 25.257).

(2) Design measures to minimize harm; e.g., tunneling, cut and cover, cut and fill, treatment of embankments, planting, screening, maintenance of pedestrian or bicycle paths and noise mitigation measures all reflecting utilization of appropriate interdisciplinary design personnel.

e. Evidence of concurrence or description of efforts to obtain concurrence of Federal, State or local officials having jurisdiction over the section 4(f) property regarding the action proposed and the measures planned to minimize harm.

f. If Federally-owned properties are involved in highway projects, the final statement shall include the action taken or an indication of the expected action after filing a map of the proposed use of the land or other appropriate documentation with the Secretary of the Department supervising the land (23 U.S.C. 317).

g. If land acquired with Federal grant money (Department of Housing and Urban Development open space or Bureau of Outdoor Recreation land and water conservation funds) is involved, the final statement shall include appropriate communications with the grantor agency.

h. TGC will determine application of section 4(f) to public interests in lands, such as easements, reversions, etc.

i. A specific finding by the Administrator that there is no feasible and prudent alternative and that the proposal includes all possible planning to minimize harm to the "4(f) area" involved.

5. Properties and sites of historic and cultural significance. The statement should document actions taken to preserve and enhance districts, sites, buildings, structures, and objects of historical, architectural, archeological, or cultural significance affected by the action.

a. Draft environmental statements should include identification, through consulting the National Register and applying the National Register Criteria (36 CFR part 600), of properties that are included in or eligible for
inclusion in the National Register of Historic Places that may be affected by the project. The National Register is published in its entirety each February in the Federal Register. Monthly additions and listings of eligible properties are published in the Federal Register the first Tuesday of each month. The Secretary of the Interior will advise, if the properties are eligible for the National Register.

b. If application of the Advisory Council on Historic Preservation’s (ACHP) Criteria of Effect (36 CFR part 800) indicates that the project will have an effect upon a property included in or eligible for inclusion in the National Register of Historic Places, the draft environmental statement should document the effect. Evaluation of the effect should be made in consultation with the State Historic Preservation Officer (SHPO) and in accordance with the ACHP’s criteria of Adverse Effect (36 CFR part 800).

c. Determinations of no adverse effect should be documented in the draft statement with evidence of the application of the ACHP’s Criteria of Adverse Effect, the views of the appropriate State Historic Preservation Officer, and submission of the determination to the ACHP for review.

d. If the project will have an adverse effect upon a property included in or eligible for inclusion in the National Register of Historic Places, the final environmental statement should include either an executed Memorandum of Agreement or comments from the Council after consideration of the project at a meeting of the ACHP and an account of actions to be taken in response to the comments of the ACHP. Procedures for obtaining a Memorandum of Agreement and the comments of the Council are found in 36 CFR part 800.

e. To determine whether the project will have an effect on properties of State or local historical, architectural, archaeological, or cultural significance not included in or eligible for inclusion in the National Register, the responsible official should consult with the State Historic Preservation Officer, with the local official having jurisdiction of the property, and where appropriate, with historical societies, museums, or academic institutions having expertise with regard to the property. Use of land from historic properties of Federal, State and local significance as determined by the official having jurisdiction thereof involves section 4(f) of the DOT Act and documentation should include information necessary to consider a 4(f) determination (see paragraph 4).

6. Impacts of the proposed action on the human environment involving community disruption and relocation. a. The statement should include a description of probable impact sufficient to enable an understanding of the extent of the environmental and social impact of the project alternatives and to consider whether relocation problems can be properly handled. This would include the following information obtainable by visual inspection of the proposed affected area and from secondary sources and community sources when available.

   (1) An estimate of the households to be displaced including the family characteristics (e.g., minorities, income levels, tenure, the elderly, large families).

   (2) Impact on the human environment of an action which divides or disrupts an established community, including where pertinent, the effect of displacement on types of families and individuals affected, effect of streets cut off, separation of residences from community facilities, separation of residential areas.

   (3) Impact on the neighborhood and housing to which relocation is likely to take place (e.g., lack of sufficient housing for large families, doublings up).

   (4) An estimate of the businesses to be displaced, and the general effect of business displacement on the economy of the community.

   (5) A discussion of relocation housing in the area and the ability to provide adequate relocation housing for the types of families to be displaced. If the resources are insufficient to meet the estimated displacement needs, a description of the actions proposed to remedy this situation including, if necessary, use of housing of last resort.

   (6) Results of consultation with local officials and community groups regarding the impacts to the community affected. Relocation agencies and staff and other social agencies can help to describe probable social impacts of this proposed action.

   (7) Where necessary, special relocation advisory services to be provided the elderly, handicapped and illiterate regarding interpretations of benefits, assistance in selecting replacement housing and consultation with respect to acquiring, leasing, and occupying replacement housing.

   b. This data should provide the preliminary basis for assurance of the availability of relocation housing as required by DOT 5620.1, Replacement Housing Policy, dated June 24, 1970, and 49 CFR 25.53.

7. Considerations relating to pedestrians and bicyclists. Where appropriate, the statement should discuss impacts on and consideration to be given in the development of the project to pedestrian and bicycle access, movement and safety within the affected area, particularly in medium and high density commercial and residential areas.

8. Other social impacts. The general social groups specially benefitted or harmed by the proposed action should be identified in the statement including the following:

   a. Particular effects of a proposal on the elderly, handicapped, non-drivers, transit dependent, or minorities should be described to the extent reasonably predictable.
b. How the proposal will facilitate or inhibit their access to jobs, educational facilities, religious institutions, health and welfare services, recreational facilities, social and cultural facilities, pedestrian movement facilities, and public transit services.

9. Standards as to noise, air, and water pollution. The statement shall reflect sufficient analysis of the effects of the proposed action on attainment and maintenance of any environmental standards established by law or administrative determination (e.g., noise, ambient air quality, water quality) including the following documentation:
   a. With respect to water quality, there should be consultation with the agency responsible for the State water pollution control program as to conformity with standards and regulations regarding storm sewer discharge, sedimentation control, and other non-point source discharges.
   b. The comments or determinations of the offices charged with administration of the State's implementation plan for air quality as to the consistency of the project with State plans for the implementation of ambient air quality standards.
   c. Conformity to adopted noise standards, compatible, if appropriate, with different land uses.

10. Energy supply and natural resources development. Where applicable, the statement should reflect consideration of whether the project or program will have any effect on either the production or consumption of energy and other natural resources, and discuss such effects if they are significant.

11. Flood hazard evaluation. When an alternative under consideration encroaches on a flood plain, the statement should include evidence that studies have been made and evidence of consultations with agencies with expertise have been carried out. Necessary measures to handle flood hazard problems should be described. In compliance with Executive Order 11296, and Flood Hazard Guidelines for Federal Executive Agencies, promulgated by the Water Resources Council, or how such requirements can be met during project development.

12. Considerations relating to wetlands or coastal zones. Where wetlands or coastal zones are involved, the statement should include:
   a. Information on location, types, and extent of wetlands areas which might be affected by the proposed action.
   b. An assessment of the impacts resulting from both construction and operation of the project on the wetlands and associated wildlife, and measures to minimize adverse impacts.
   c. A statement by the local representative of the Department of the Interior, and any other responsible officials with special expertise, setting forth his views on the impacts of the project on the wetlands, the worth of the particular wetlands areas involved to the community and to the Nation, and recommendations as to whether the proposed action should proceed, and, if applicable, along what alternative route.

d. Where applicable, a discussion of how the proposed project relates to the State coastal zone management program for the particular State in which the project is to take place.

13. Construction impacts. In general, adverse impacts during construction will be of less importance than long-term impacts of a proposal. Nonetheless, statements should appropriately address such matters as the following identifying any special problems areas:
   a. Noise impacts from construction and any specifications setting maximum noise levels.
   b. Disposal of spoil and effect on borrow areas and disposal sites (include specifications where special problems are involved).
   c. Measures to minimize effects on traffic and pedestrians.

14. Land use and urban growth. The statement should include, to the extent relevant and predictable:
   a. The effect of the project on land use, development patterns, and urban growth.
   b. Where significant land use and development impacts are anticipated, identify public facilities needed to serve the new development and any problems or issues which would arise in connection with these facilities, and the comments of agencies that would provide these facilities.

ATTACHMENT 2—AREAS OF ENVIRONMENTAL IMPACT AND FEDERAL AGENCIES WITH JURISDICTION BY LAW OR SPECIAL EXPERTISE TO COMMENT THEREON

EDITORIAL NOTE: Filed as part of the original document. For text see 39 FR 32546, Sept. 30, 1975.

ATTACHMENT 3—OFFICES WITHIN FEDERAL AGENCIES AND FEDERAL-STATE AGENCIES FOR INFORMATION REGARDING THE AGENCIES’ IMPACT STATEMENTS FOR WHICH COMMENTS ARE REQUESTED

EDITORIAL NOTE: Filed as part of the original document. For text see 39 FR 35248, Sept. 30, 1975.

ATTACHMENT 4—STATE AND LOCAL AGENCY REVIEW OF IMPACT STATEMENTS

1. OMB Revised Circular No. A-96 through its system of clearinghouses provides a
means for securing the views of State and
local environmental agencies, which can as-
sist in the preparation of impact statements.
Under A–95, review of the proposed project in
the case of federally assisted projects (Part I
of A–95) generally takes place prior to the
preparation of the impact statement. There-
fore, comments on the environmental effects
of the proposed project that are secured dur-
ding this stage of the A–95 process represent
inputs to the environmental impact state-
ment.
2. In the case of direct Federal develop-
ment (Part II of A–95), Federal agencies are
required to consult with clearinghouses at
the earliest practicable time in the planning
of the project or activity. Where such con-
sultation occurs prior to completion of the
draft impact statement, comments relating
to the environmental effects of the proposed
action would also represent inputs to the en-
vironmental impact statement.
3. In either case, whatever comments are
made on environmental effects of proposed
Federal or federally assisted projects by
clearinghouses, or by State and local envi-
ronmental agencies through clearinghouses,
in the course of the A–95 review should be at-
tached to the draft impact statement when
it is circulated for review. Copies of the
statement should be sent to the agencies
making such comments. Whether those agen-
cies then elect to comment again on the
basis of the draft statement is a mat-
ter to be left to the discretion of the com-
menting agency depending on its resources,
the significance of the project and the extent
to which its earlier comments were consid-
ered in preparing the draft statement.
4. The clearinghouses may also be used, by
mutual agreement, for securing reviews of
the draft environmental impact statement.
However, the Federal agency may wish to
deal directly with appropriate State or local
agencies in the review of impact statements
because the clearinghouses may be unwilling
or unable to handle this phase of the process.
In some cases, the Governor may have des-
ignated a specific agency, other than the
clearinghouse, for securing reviews of impact
statements. In any case, the clearinghouses
should be sent copies of the impact state-
ment.
5. To aid clearinghouses in coordinating
State and local comments, draft statements
should include copies of State and local
agency comments made earlier under the A–
ine process and should indicate on the sum-
mary sheet those other agencies from which
comments have been requested, as specified
in Attachment 1.

PART 523—VEHICLE
CLASSIFICATION

Sec. 523.1 Scope.
523.2 Definitions.
523.3 Automobile.
523.4 Passenger automobile.
523.5 Light truck.

§ 523.1 Scope.
This part establishes categories of
vehicles that are subject to title V of
the Motor Vehicle Information and
(Sec. 301, Pub. L. 94–163, 80 Stat. 901 (15
U.S.C. 2001))
[42 FR 38362, July 28, 1977]

§ 523.2 Definitions.

Approach angle means the smallest
angle, in a plane side view of an auto-
mobile, formed by the level surface on
which the automobile is standing and a
line tangent to the front tire static
loaded radius arc and touching the un-
derside of the automobile forward of
the front tire.

Axle clearance means the vertical dis-
tance from the level surface on which
an automobile is standing to the lowest
point on the axle differential of the
automobile.

Basic vehicle frontal area is used as de-
defined in 40 CFR 86.079–2.

Breakover angle means the supple-
ment of the largest angle, in the plan
side view of an automobile, that can be
formed by two lines tangent to the
front and rear static loaded radii arcs
and intersecting at a point on the un-
derside of the automobile.

Cargo-carrying volume means the lug-
gage capacity or cargo volume index,
as appropriate, and as those terms are
defined in 40 CFR 600.315, in the case of
automobiles to which either of those
terms apply. With respect to auto-
mobiles to which neither of those
terms apply "cargo-carrying volume" means
the total volume in cubic feet
rounded to the nearest 0.1 cubic feet of
either an automobile’s enclosed non-
seating space that is intended pri-
marily for carrying cargo and is not ac-
cessible from the passenger compart-
ment, or the space intended primarily
for carrying cargo bounded in the front by a vertical plane that is perpendicular to the longitudinal centerline of the automobile and passes through the rearmost point on the rearmost seat and elsewhere by the automobile’s interior surfaces.

Curb weight is defined the same as vehicle curb weight in 40 CFR part 86.

Depreciation angle means the smallest angle, in a plane side view of an automobile, formed by the level surface on which the automobile is standing and a line tangent to the rear tire static loaded radius arc and touching the underside of the automobile rearward of the rear tire.

Footprint is defined as the product of track width (measured in inches and rounded to the nearest tenth of an inch) times wheelbase (measured in inches and rounded to the nearest tenth of an inch) divided by 144 and then rounded to the nearest tenth of a square foot. For purposes of this definition, track width is the lateral distance between the centerlines of the base tires at ground, including the camber angle. For purposes of this definition, wheelbase is the longitudinal distance between front and rear wheel centerlines.

Gross vehicle weight rating means the value specified by the manufacturer as the loaded weight of a single vehicle.

Medium duty passenger vehicle means a vehicle which would satisfy the criteria in §523.5 (relating to light trucks) but for its gross vehicle weight rating or its curb weight, which is rated at more than 8,500 lbs GVWR or has a vehicle curb weight of more than 6,000 pounds or has a basic vehicle frontal area in excess of 45 square feet, and which is designed primarily to transport passengers, but does not include a vehicle that:

(1) Is an “incomplete truck” as defined in this subpart; or
(2) Has a seating capacity of more than 12 persons; or
(3) Is designed for more than 9 persons in seating rearward of the driver’s seat; or
(4) Is equipped with an open cargo area (for example, a pick-up truck box or bed) of 72.0 inches in interior length or more. A covered box not readily accessible from the passenger compartment will be considered an open cargo area for purposes of this definition.

Passenger-carrying volume means the sum of the front seat volume and, if any, rear seat volume, as defined in 40 CFR 600.315, in the case of automobiles to which that term applies. With respect to automobiles to which that term does not apply, “passenger-carrying volume” means the sum in cubic feet, rounded to the nearest 0.1 cubic feet, of the volume of a vehicle’s front seat and seats to the rear of the front seat, as applicable, calculated as follows with the head room, shoulder room, and leg room dimensions determined in accordance with the procedures outlined in Society of Automotive Engineers Recommended Practice J1100a, Motor Vehicle Dimensions (Report of Human Factors Engineering Committee, Society of Automotive Engineers, approved September 1973 and last revised September 1975).

(a) For front seat volume, divide 1,728 into the product of the following SAE dimensions, measured in inches to the nearest 0.1 inches, and round the quotient to the nearest 0.001 cubic feet.
(1) H61-Effective head room—front.
(2) W3-Shoulder room—front.
(3) L34-Maximum effective leg room—accelerator.

(b) For the volume of seats to the rear of the front seat, divide 1,728 into the product of the following SAE dimensions, measured in inches to the nearest 0.1 inches, and rounded the quotient to the nearest 0.001 cubic feet.
(1) H63-Effective head room—second.
(2) W4-Shoulder room—second.
(3) L51-Minimum effective leg room—accelerator.

Running clearance means the distance from the surface on which an automobile is standing to the lowest point on the automobile, excluding unsprung weight.

Static loaded radius arc means a portion of a circle whose center is the center of a standard tire-rim combination of an automobile and whose radius is the distance from that center to the level surface on which the automobile is standing, measured with the automobile at curb weight, the wheel parallel to the vehicle’s longitudinal centerline, and the tire inflated to the manufacturer’s recommended pressure.
§ 523.3 Automobile.

(a) An automobile is any 4-wheeled vehicle propelled by fuel which is manufactured primarily for use on public streets, roads, and highways (except any vehicle operated exclusively on a rail or rails), and that either—

(1) Is rated at 6,000 pounds gross vehicle weight or less; or

(2) Which—

(i) Is rated more than 6,000 pounds gross vehicle weight, but less than 10,000 pounds gross vehicle weight,

(ii) Is a type of vehicle for which the Administrator determines, under paragraph (b) of this section, average fuel economy standards are feasible, and

(iii)(A) Is a type of vehicle for which the Administrator determines, under paragraph (b) of this section, average fuel economy standards will result in significant energy conservation, or

(B) Is a type of vehicle which the Administrator determines, under paragraph (b) of this section, is substantially used for the same purposes as vehicles described in paragraph (a)(1) of this section.

(b) The following vehicles rated at more than 6,000 pounds and less than 10,000 pounds gross vehicle weight are determined to be automobiles:

(1) Vehicles which would satisfy the criteria in §523.4 (relating to passenger automobiles) but for their gross vehicle weight rating.

(2) Vehicles which would satisfy the criteria in §523.5 (relating to light trucks) but for their gross vehicle weight rating, and which

(i) Have a basic vehicle frontal area of 45 square feet or less,

(ii) Have a curb weight of 6,000 pounds or less,

(iii) Have a gross vehicle weight rating of 8,500 pounds or less, and

(iv) Are manufactured during the 1980 model year or thereafter.

(3) Vehicles that are defined as medium duty passenger vehicles, and which are manufactured during the 2011 model year or thereafter.

§ 523.4 Passenger automobile.

A passenger automobile is any automobile (other than an automobile capable of off-highway operation) manufactured primarily for use in the transportation of not more than 10 individuals.

§ 523.5 Light truck.

(a) A light truck is an automobile other than a passenger automobile which is either designed for off-highway operation, as described in paragraph (b) of this section, or designed to perform at least one of the following functions:

(1) Transport more than 10 persons;

(2) Provide temporary living quarters;

(3) Transport property on an open bed;

(4) Provide greater cargo-carrying than passenger-carrying volume; or

(5) Permit expanded use of the automobile for cargo-carrying purposes or other nonpassenger-carrying purposes through:

(i) For light trucks manufactured prior to model year 2012, the removal of seats by means installed for that purpose by the automobile’s manufacturer or with simple tools, such as screwdrivers and wrenches, so as to create a flat, floor level, surface extending from the forwardmost point of installation of those seats to the rear of the automobile’s interior; or
(ii) For light trucks manufactured in model year 2008 and beyond, for vehicles equipped with at least 3 rows of designated seating positions as standard equipment, permit expanded use of the automobile for cargo-carrying purposes or other nonpassenger-carrying purposes through the removal or stowing of foldable or pivoting seats so as to create a flat, leveled cargo surface extending from the forwardmost point of installation of those seats to the rear of the automobile's interior.

(b) An automobile capable of offhighway operation is an automobile—

(1)(i) That has 4-wheel drive; or

(ii) Is rated at more than 6,000 pounds gross vehicle weight; and

(2) That has at least four of the following characteristics (see Figure 1) calculated when the automobile is at curb weight, on a level surface, with the front wheels parallel to the automobile's longitudinal centerline, and the tires inflated to the manufacturer's recommended pressure—

(i) Approach angle of not less than 28 degrees.

(ii) Breakover angle of not less than 14 degrees.

(iii) Departure angle of not less than 20 degrees.

(iv) Running clearance of not less than 20 centimeters.

(v) Front and rear axle clearances of not less than 18 centimeters each.

525.11 Termination of exemption; amendment of alternative average fuel economy standard.

525.12 Public inspection of information.

Source: 42 FR 38376, July 28, 1977, unless otherwise noted.

§ 525.1 Scope.

This part establishes procedures under section 502(c) of the Motor Vehicle Information and Cost Savings Act, as amended (15 U.S.C. 2002) for the submission and disposition of petitions filed by low volume manufacturers of passenger automobiles to exempt them from the average fuel economy standards for passenger automobiles and to establish alternative average fuel economy standards for those manufacturers.

§ 525.2 Purpose.

The purpose of this part is to provide content and format requirements for low volume manufacturers of passenger automobiles which desire to petition the Administrator for exemption from applicable average fuel economy standards and for establishment of appropriate alternative average fuel economy standards and to give interested persons an opportunity to present data, views and arguments on those petitions.

§ 525.3 Applicability.

This part applies to passenger automobile manufacturers.

§ 525.4 Definitions.

(a) Statutory terms. (1) The terms fuel, manufacture, manufacturer, and model year, are used as defined in section 501 of the Act.

(2) The terms average fuel economy, fuel economy, and model type are used as defined in 40 CFR 600.002-77.

(3) The term automobile means a vehicle determined by the Administrator under 49 CFR part 523 to be an automobile.

(4) The term passenger automobile means an automobile determined by the Administrator under 49 CFR part 523 to be a passenger automobile.

(5) The term customs territory of the United States is used as defined in 19 U.S.C. 1202.

525.11 Termination of exemption; amendment of alternative average fuel economy standard.

525.12 Public inspection of information.

Source: 42 FR 38376, July 28, 1977, unless otherwise noted.
Other terms. (1) The term base level and vehicle configuration are used as defined in 40 CFR 600.002–77.

(2) The term vehicle curb weight is used as defined in 40 CFR 85.002.

(3) The term interior volume index is used as defined in 40 CFR 600.315–77.

(4) The term frontal area is used as defined in 40 CFR 86.129–79.

(5) The term basic engine is used as defined in 40 CFR 600.002–77(a)(21).

(6) The term designated seating position is defined in 49 CFR 571.3.

(7) As used in this part, unless otherwise required by the context:

Administrator means the Administrator of the National Highway Traffic Safety Administration;

Affected model year means a model year for which an exemption and alternative average fuel economy standard are requested under this part;

Production mix means the number of passenger automobiles, and their percentage of the petitioner's annual total production of passenger automobiles, in each vehicle configuration which a petitioner plans to manufacture in a model year; and

Total drive ratio means the ratio of an automobile’s engine rotational speed (in revolutions per minute) to the automobile’s forward speed (in miles per hour).

§ 525.7 Basis for petition.

(a) Identify the model year or years for which exemption is requested;

(b) Be submitted not later than 24 months before the beginning of the affected model year, unless good cause for later submission is shown;

(c) Be submitted in three copies to: Administrator, National Highway Traffic Safety Administration, Washington, DC 20590;

(d) Be written in the English language;

(e) State the full name, address, and title of the official responsible for preparing the petition, and the name and address of the manufacturer;

(f) Set forth in full data, views and arguments of the petitioner supporting the exemption and alternative average fuel economy standard requested by the petitioner, including the information and data specified by §525.7 and the calculations and analyses used to develop that information and data. No documents may be incorporated by reference in a petition unless the documents are submitted with the petition;

(g) Specify and segregate any part of the information and data submitted under this part that the petitioner wishes to have withheld from public disclosure in accordance with part 512 of this chapter.

§ 525.5 Limitation on eligibility.

Any manufacturer that manufactures (whether or not in the customs territory of the United States) 10,000 or more passenger automobiles in the second model year preceding an affected model year or in the affected model year is ineligible for an exemption for that affected model year.

§ 525.6 Requirements for petition.

Each petition filed under this part must—
year immediately preceding each affected model year.

(d) For each affected model year, the petitioner’s projections of the most fuel efficient production mix of vehicle configurations and base levels of its passenger automobiles which the petitioner could sell in that model year, and a discussion demonstrating that these projections are reasonable. The discussion shall include information showing that the projections are consistent with—

1. The petitioner’s annual total production and production mix of passenger automobiles manufactured or likely to be manufactured in each of the four model years immediately preceding that affected model year;
2. Its passenger automobile production capacity for that affected model year;
3. Its efforts to comply with that average fuel economy standard; and
4. Anticipated consumer demand in the United States for passenger automobiles during that affected model year.

(e) For each affected model year, a description of the following features of each vehicle configuration of the petitioner’s passenger automobiles to be manufactured in that affected model year:

1. Maximum overall body width, overall length, and overall height, determined in accordance with Motor Vehicle Dimensions SAE J1100a (report of Human Engineering Committee, approved September 1973, as revised September 1975);
2. Vehicle curb weight;
3. Number of designated seating positions and interior volume index;
4. Basic engine, displacement, and SAE rated net power, kilowatts;
5. Fuel metering system, including the number of carburetor barrels, if applicable;
6. Drive train configuration and total drive ratio;
7. Emission control system;
8. Dynamometer road load setting, determined in accordance with 40 CFR part 86, and the method used to determine that setting, including information indicating whether the road load setting was adjusted to account for the presence of air conditioning and whether the setting was based on the use of radial ply tires; and
9. Use of synthetic lubricants, low viscosity lubricants, or lubricants with additives that affect friction characteristics in the crankcase, differential, and transmission of the vehicles tested under the requirements of 40 CFR parts 86 and 600. With respect to automobiles which will use these lubricants, indicate which one will be used and explain why that type was chosen. With respect to automobiles which will not use these lubricants, explain the reasons for not so doing.

(f) For each affected model year, a fuel economy value for each vehicle configuration specified in 40 CFR 600.506(a)(2), base level, and model type of the petitioner’s passenger automobiles to be manufactured in that affected model year calculated in accordance with subpart C of 40 CFR part 600 and based on tests or analyses comparable to those prescribed or permitted under 40 CFR part 600 and a description of the test procedures or analytical methods.

(g) For each affected model year, an average fuel economy figure for the petitioner’s passenger automobiles to be manufactured in that affected model year calculated in accordance with 40 CFR 600.510(e) and based upon the fuel economy values provided under paragraph (f) of this section and upon the petitioner’s production mix projected under paragraph (d) of this section for the affected model year.

(h) Information demonstrating that the average fuel economy figure provided for each affected model year under paragraph (g) of this section is the maximum feasible average fuel economy achievable by the petitioner for that model year, including—

1. For each affected model year and each of the two model years immediately following the first affected model year, a description of the technological means selected by the petitioner for improving the average fuel economy of its automobiles to be manufactured in that model year.
2. A chronological description of the petitioner’s past and planned efforts to implement the means described under paragraph (h)(1) of this section.
§ 525.11 Termination of exemption; amendment of alternative average fuel economy standard.

(a) Any exemption granted under this part for an affected model year does not apply to a manufacturer that is ineligible under § 525.5 for an exemption in that model year.

(b) The administrator may initiate rulemaking either on his own motion or on petition by an interested person to terminate an exemption granted under this part or to amend an alternative average fuel economy standard established under this part.

(c) Any interested persons may petition the Administrator to terminate an exemption granted under this part or to amend an alternative average fuel economy standard established under this part.
§ 525.12 Public inspection of information.

(a) Except as provided in paragraph (b), any person may inspect available information relevant to a petition under this part, including the petition and any supporting data, memoranda of informal meetings with the petitioner or any other interested persons, and the notices regarding the petition, in the Docket Section of the National Highway Traffic Safety Administration. Any person may obtain copies of the information available for inspection under this paragraph in accordance with Part 7 of the regulations of the Office of the Secretary of Transportation (49 CFR part 7).

(b) Except for the release of confidential information authorized by section 505 of the Act and part 512 of this chapter, information made available for public inspection does not include information for which confidentiality is requested under §525.6(g) and is granted in accordance with Part 512 and sections 502 and 505 of the Act and section 552(b) of title 5 of the U.S.C.

[46 FR 2063, Jan. 8, 1981]

PART 526—PETITIONS AND PLANS FOR RELIEF UNDER THE AUTOMOBILE FUEL EFFICIENCY ACT OF 1980

Sec.
526.1 General provisions.
526.2 U.S. production by foreign manufacturer.
526.3 Transfer of vehicle from non-domestic to domestic fleet.
526.4 [Reserved]
526.5 Earning offsetting monetary credits in future model years.

SOURCE: 47 FR 7248, Feb. 18, 1982, unless otherwise noted.

§ 526.1 General provisions.

(b) Address. Each petition and plan submitted under the applicable provisions of sections 502 and 503 of the Motor Vehicle Information and Cost Savings Act must be addressed to the Administrator, National Highway Traffic Safety Administration, 400 Seventh Street, SW., Washington DC 20590.

(c) Authority and scope of relief. Each petition or plan must specify the specific provision of the Motor Vehicle Information and Cost Savings Act under which relief is being sought. The petition or plan must also specify the model years for which relief is being sought.

§ 526.2 U.S. production by foreign manufacturer.

Each petition filed under section 503(b)(3) of the Motor Vehicle Information and Cost Savings Act must contain the following information:

(a) For each model type (as defined by the Environmental Protection Agency in 40 CFR part 600) planned by the petitioner to be sold in the United States (regardless of place of manufacture), and for each model year beginning with the year before the first one for which relief is sought by the petition through the last year covered by the petition, the following information based on the petitioner’s current product plan and the assumption that the petition will be granted:

1. A description of the model type, including car line designation, engine displacement and type, transmission type, and average fuel economy;

2. U.S. sales projected for the model type;

3. The average percentage of the cost to the manufacturer of the model type which is attributable to value added in the United States or Canada, determined in accordance with 40 CFR 600.511–80, and the total manufacturing cost per vehicle; and

4. In the case of model types not offered for sale in the United States before the first year for which relief is sought in the petition or other model types for which expansions in production capacity are planned during the years covered by the petition, information (including any marketing surveys)
indicating from where the additional sales will be captured. If sales are projected to be captured from U.S. manufacturers, the petition must provide an estimate of the employment impact on those manufacturers of the lost sales and the gain in employment for the petitioner and its U.S. suppliers.

(b) The total number of persons employed in the United States by the petitioner, excluding non-motor vehicle industry related employees, for each model year covered by the petition and for the model year immediately prior to those years.

(c) A description of how the petitioner's responses to paragraphs (a) and (b) of this section would differ if the petition were denied.

§ 526.3 Transfer of vehicle from non-domestic to domestic fleet.

Each plan submitted under section 503(b)(4) of the Motor Vehicle Information and Cost Savings Act must contain the following information:

(a) For each model year for which relief is sought in the plan and for each model type of automobile sought to be included by the submitter in its domestic fleet under the plan (i.e., those with at least 50 percent but less than 75 percent U.S. or Canadian value added), provide the following information:

(1) A description of the model type, including engine type and displacement, transmission class, car line designation, and fuel economy;

(2) The projected U.S. sales of the model type;

(3) The average total manufacturing cost per vehicle for the model type;

(4) The percentage of the cost to the manufacturer attributable to value added in the United States or Canada for the model type;

(b) For each year covered by the plan, a list of individual product actions (e.g., change from imported engine to domestically manufactured engine) which will increase the domestic content of the affected vehicles. For each action, provide the model year in which the action will take effect, a description of the nature of the action, and the percentage change in domestic content resulting from the action.

§ 526.4 [Reserved]

§ 526.5 Earning offsetting monetary credits in future model years.

Each plan submitted under section 502(l) of the Motor Vehicle Information and Cost Savings Act must contain the following information:

(a) Projected average fuel economy and production levels for the class of automobiles which may fail to comply with a fuel economy standard and for any other classes of automobiles from which credits may be transferred, for the current model year and for each model year thereafter ending with the last year covered by the plan.

(b) A list and full description of each planned product action (e.g., new model, mix change) which will affect the average fuel economy of the class of automobiles subject to the credit earning plan, for each model year beginning with the current model year and ending with the last year covered by the credit earning plan.

(c) The portion of the petitioner's fleet affected by each product action (e.g., all K-cars with 6-cylinder engines) and the number of affected vehicles.

(d) The fuel economy effect of each product action specified under paragraph (b) of this section per affected vehicle.

PART 529—MANUFACTURERS OF MULTISTAGE AUTOMOBILES

Sec. 529.1 Scope and purpose.

529.2 Applicability.

529.3 Definitions.

529.4 Requirements for incomplete automobile manufacturers.

529.5 Requirements for intermediate manufacturers.

529.6 Requirements for final-stage manufacturers.

§ 529.1  Scope and purpose.

This part determines, in cases where more than one person is the manufacturer of an automobile, which person is to be treated as the manufacturer for purposes of compliance with Title V of the Motor Vehicle Information and Cost Savings Act, as amended (15 U.S.C. 2001 et seq.) and rules issued thereunder.

§ 529.2  Applicability.

This part applies to incomplete automobile manufacturers, intermediate manufacturers, and final-stage manufacturers of automobiles that are manufactured in two or more stages.

§ 529.3  Definitions.

(a) Statutory terms. (1) The term automobile is used as defined in section 501 of the Act and in accordance with the determinations in 49 CFR part 523.

(2) The terms manufacture, manufacturer, and fuel economy are used as defined in section 501 of the Act.

(2) Completed automobile means an automobile that requires no further manufacturing operations to perform its intended function, other than the addition of readily attachable components, such as mirrors or tire and rim assemblies, or minor finishing operations such as painting.

(3) Curb weight is defined the same as vehicle curb weight in 40 CFR part 86.

(4) Final-stage manufacturer means a person who performs such manufacturing operations on an incomplete automobile that it becomes a completed automobile.

(5) Frontal area is used as defined in 40 CFR 86.079–2.

(6) Incomplete automobile means an assemblage consisting, as a minimum, of frame and chassis structure, power train, steering system, suspension system, and braking system to the extent that those systems are to be part of the completed automobile, that requires further manufacturing operations, other than the addition of readily attachable components, such as mirrors or tire and rim assemblies, or minor finishing operations such as painting, to become a completed automobile.

(7) Incomplete automobile manufacturer means a person who manufactures an incomplete automobile by assembling components none of which, taken separately, constitute a complete automobile.

(8) Intermediate manufacturer means a person, other than the incomplete automobile manufacturer or the final-stage manufacturer, who performs manufacturing operations on an incomplete automobile.

§ 529.4  Requirements for incomplete automobile manufacturers.

(a) Except as provided in paragraph (c) of this section, §§529.5 and 529.6, each incomplete automobile manufacturer is considered, with respect to multistage automobiles incorporating its incomplete automobiles, the manufacturer of the multistage automobiles for purposes of the requirements of Title V and rules issued thereunder.

(b) Each incomplete automobile manufacturer shall furnish with each of its incomplete automobiles, when it is delivered to the subsequent manufacturer, (1) a document that contains the following information—

(i) Name and mailing address of the incomplete automobile manufacturer.

(ii) Month and year during which the incomplete automobile manufacturer performed its last manufacturing operation on the incomplete automobile.

(iii) Identification of the incomplete automobile or group of incomplete automobiles to which the document applies. The identification may be by serial number or otherwise, but it must be sufficient to enable a subsequent manufacturer to ascertain positively that the document applies to a particular incomplete automobile even if the document is not attached to that automobile.
(iv) Fuel economy values determined by the incomplete automobile manufacturer for the automobile in accordance with 40 CFR part 600 and a statement that a fuel economy label containing those values has been prepared in accordance with Environmental Protection Agency regulation by the manufacturer identified in the document.

(v) Maximum curb weight that may not be exceeded by a subsequent manufacturer without invalidating the fuel economy values determined by the incomplete automobile manufacturer.

(vi) Maximum frontal area that may not be exceeded by a subsequent manufacturer without invalidating the fuel economy values determined by the incomplete automobile manufacturer.

(vii) Whether the fuel economy values have been computed with the road load horsepower set to take into account the presence of air conditioning.

(2) A fuel economy label conforming with 40 CFR part 600.

(c)(1) The incomplete automobile manufacturer shall either attach the document specified in paragraph (b)(1) of this section to the incomplete automobile in such a manner that it will not be inadvertently detached or send that document directly to the subsequent manufacturer to which that automobile is delivered.

(2)(i) If the incomplete automobile manufacturer places the portion of the body including the windshield and front seat side windows on the incomplete automobile, that manufacturer shall attach the fuel economy label specified in paragaph (b)(2) of this section to that automobile in accordance with 40 CFR part 600. If the incomplete automobile manufacturer does not place that portion of the body on the incomplete automobile, that manufacturer shall send that label directly to the subsequent manufacturer to which that automobile is delivered.

(ii) Upon request by an intermediate or final-stage manufacturer for a copy of a fuel economy label that is required by paragraph (b)(2) of this section to have been prepared by the incomplete automobile manufacturer for one of its incomplete automobiles, identified by the requesting manufacturer in the same fashion as in the document specified in paragraph (b)(1) of this section, the incomplete automobile manufacturer shall send that manufacturer a copy of the label.

§529.5 Requirements for intermediate manufacturers.

(a) Except as provided in paragraph (d) of this section and in §529.6, each intermediate manufacturer whose manufacturing operations on an incomplete automobile cause it to exceed the maximum curb weight or maximum frontal area set forth in the document furnished it by the incomplete automobile manufacturer under §529.4(c)(1) or by a previous intermediate manufacturer under paragraph (b) of this section, as appropriate, is considered the manufacturer of the multistage automobile manufactured from that automobile for the purpose of the requirements of Title V and rules issued thereunder, other than that in part 537, Fuel Economy Reports.

(b) Each intermediate manufacturer of an incomplete automobile shall furnish, in the manner specified in §529.4(c), to the subsequent manufacturer of that automobile the document required by §529.4(b) regarding that automobile. If any of the changes in the automobile made by the intermediate manufacturer affect the validity of the fuel economy values or other statement in the document or any addendum attached to the document by a previous manufacturer of the automobile, the intermediate manufacturer shall furnish an addendum to the document that contains its name and mailing address and an indication of all changes that should be made in the document to reflect changes that it made in the automobile.

(c) Each intermediate manufacturer that is required by paragraph (b) of this section to furnish an addendum to a document required by §529.4(b) shall, within 10 days after completing its manufacturing operations, send a copy of the document and addendum to the Administrator of the Environmental Protection Agency and to the manufacturer previously considered under this part to be the manufacturer of the automobile.

(d)(1) If the intermediate manufacturer’s manufacturing operations on an
incomplete automobile cause it to exceed the maximum curb weight or maximum frontal area set forth in the document furnished it by the incomplete automobile manufacturer under §529.4(c)(1) or a previous intermediate manufacturer under paragraph (b) of this section, as appropriate, that manufacturer shall prepare a new fuel economy label for that automobile in accordance with 40 CFR part 600.

(2) If neither the intermediate manufacturer of an incomplete automobile nor any previous manufacturer of that automobile has placed the portion of the body including the windshield and front seat side windows on that automobile, the intermediate manufacturer shall send the fuel economy label furnished it by the incomplete automobile manufacturer under §529.4(c)(2)(i) or a previous intermediate manufacturer under paragraph (d)(2) of this section or prepared by it under paragraph (d)(1) of this section, as appropriate, directly to the subsequent manufacturer to which that automobile is delivered.

(3) If the intermediate manufacturer places the portion of the body including the windshield and front seat side windows on the incomplete automobile, that manufacturer shall attach the fuel economy label furnished it under §529.4(c)(i) or paragraph (d)(2) of this section or the fuel economy label prepared by it under paragraph (d)(1) of this section, as appropriate, to that automobile in accordance with 40 CFR part 600.

(4) The intermediate manufacturer shall attach to the incomplete automobile in accordance with 40 CFR part 600 a fuel economy label identical to the label that is required under this part to have been prepared by the manufacturer considered under this part to be the manufacturer of that automobile if:

(i) The portion of the body including the windshield and front seat side windows was added to the incomplete automobile by a previous manufacturer;

(ii) The intermediate manufacturer’s manufacturing operations do not cause that automobile to exceed either of the maxima specified in paragraph (d)(1) of this section; and

(iii) That label is not on that automobile when received by the intermediate manufacturer or is removed from that automobile while it is in the possession of that manufacturer.

(5) Upon request by a subsequent intermediate manufacturer or by a final-stage manufacturer for a copy of a fuel economy label prepared by the intermediate manufacturer under paragraph (d)(1) of this section for one of its incomplete automobiles, identified by the requesting manufacturer in the same fashion as in the document specified in §529.4(b)(1), the intermediate manufacturer shall send that manufacturer a copy of that label.

§529.6 Requirements for final-stage manufacturers.

(a) Except as provided in paragraph (c) of this section, each final-stage manufacturer whose manufacturing operations on an incomplete automobile cause the completed automobile to exceed the maximum curb weight or maximum frontal area set forth in the document specified in §529.4(b) and furnished it by the incomplete automobile manufacturer under §529.4(c)(1) or by the last intermediate manufacturer under §529.5(b), as appropriate, is considered the manufacturer of the completed automobile for the purpose of the requirements of Title V and rules issued thereunder, other than those in part 537, Fuel Economy Reports.

(b) Each final-stage manufacturer that becomes the manufacturer of a multistage automobile under paragraph (a) of this section shall, within 10 days after completing its manufacturing operations on that automobile, send written notification of its exceeding the curb weight or frontal area maximum to the Administrator of the Environmental Protection Agency and to the manufacturer previously considered under this part to be the manufacturer of that automobile.

(c)(1) If the final-stage manufacturer becomes the manufacturer of a multistage automobile under paragraph (a)(1) of this section, that manufacturer shall prepare a new fuel economy label for that automobile in accordance with 40 CFR part 600.
§ 531.5 Fuel economy standards.

(a) Except as provided in paragraph (b) of this section, each manufacturer of passenger automobiles shall comply with the following standards in the model years specified:

(b) The following manufacturers shall comply with the standards indicated below for the specified model years:

1. Avanti Motor Corporation.

§ 531.1 Scope.

This part establishes average fuel economy standards pursuant to section 502 (a) and (c) of the Motor Vehicle Information and Cost Savings Act, as amended, for passenger automobiles.

(11) Dutcher Motors, Inc.
§ 533.2 Purpose.

The purpose of this part is to increase the fuel economy of light trucks year shall be determined in accordance with procedures established by the Administrator of the Environmental Protection Agency under section 502(a)(1) of the Act and set forth in 40 CFR part 600.

(b) A manufacturer that is eligible to elect a model year in which to include value added in Mexico as domestic value, under subparagraphs (B)(i) and (B)(iii) of 49 U.S.C. 32904(b)(3), shall notify the Administrators of the Environmental Protection Agency and the National Highway Traffic Safety Administration of its election not later than 60 days before it begins production of automobiles for the model year. If an eligible manufacturer does not elect a model year before January 1, 2004, any value added in Mexico will be considered domestic value for automobiles manufactured in the next model year beginning after January 1, 2004, and in subsequent model years.

PART 533—LIGHT TRUCK FUEL ECONOMY STANDARDS

Sec.
533.1 Scope.
533.2 Purpose.
533.3 Applicability.
533.4 Definitions.
533.5 Requirements.
533.6 Measurement and calculation procedures.

APPENDIX A TO PART 533—EXAMPLE OF CALCULATING COMPLIANCE UNDER § 533.5 PARAGRAPH (g)

§ 533.1 Scope.

This part establishes average fuel economy standards pursuant to section 502(b) of the Motor Vehicle Information and Cost Savings Act, as amended, for light trucks.

§ 533.2 Purpose.

The purpose of this part is to increase the fuel economy of light trucks.
§ 533.3
by establishing minimum levels of average fuel economy for those vehicles.

§ 533.3 Applicability.
This part applies to manufacturers of light trucks.

§ 533.4 Definitions.
(a) Statutory terms. (1) The terms average fuel economy, average fuel economy standard, fuel economy, import, manufacturer, and model year are used as defined in section 501 of the Act.
(2) The term automobile is used as defined in section 501 of the Act and in accordance with the determinations in part 523 of this chapter.
(3) The term domestically manufactured is used as defined in section 503(b)(2)(E) of the Act.
(b) Other terms. As used in this part, unless otherwise required by the context—
(2) Light truck is used in accordance with the determinations in part 523 of this chapter.
Captive import means with respect to a light truck, one which is not domestically manufactured but which is imported in the 1980 model year or thereafter by a manufacturer whose principal place of business is in the United States.
4-wheel drive, general utility vehicle means a 4-wheel drive, general purpose automobile capable of off-highway operation that has a wheelbase of not more than 280 centimeters, and that has a body shape similar to 1977 Jeep CJ–5 or CJ–7, or the 1977 Toyota Land Cruiser.
Basic engine means a unique combination of manufacturer, engine displacement, number of cylinders, fuel system (as distinguished by number of carburetor barrels or use of fuel injection), and catalyst usage.
Limited product line light truck means a light truck manufactured by a manufacturer whose light truck fleet is powered exclusively by basic engines which are not also used in passenger automobiles.

§ 533.5 Requirements.
(a) Each manufacturer of light trucks shall comply with the following average fuel economy standards, expressed in miles per gallon, in the model year specified as applicable:

<table>
<thead>
<tr>
<th>Model Year</th>
<th>2-wheel drive light trucks</th>
<th>4-wheel drive light trucks</th>

**FIGURE 1**

\[
\text{Required \ Fuel \ Economy \ Level} = \frac{N}{\sum_i N_i} T_i
\]

Where:

- \( N \) is the total number (sum) of light trucks produced by a manufacturer,
- \( N_i \) is the number (sum) of the \( i \)th light truck model type produced by the manufacturer, and
- \( T_i \) is fuel economy target of the \( i \)th light truck model type, which is determined according to the following formula, rounded to the nearest hundredth:

\[
T = \frac{1}{\frac{1}{a} + \left(\frac{1}{b} - \frac{1}{a}\right) e^{(x-c)/d}}
\]

Where:

- \( a \), \( b \), \( c \), and \( d \) are defined in §533.3 Table V;
- \( e = 2.718 \); and
- \( x \) = footprint (in square feet, rounded to the nearest tenth) of the model type.

(b)(1) For model year 1979, each manufacturer may:
- Combine its 2- and 4-wheel drive light trucks and comply with the average fuel economy standard in paragraph (a) of this section for 2-wheel drive light trucks; or
- Comply separately with the two standards specified in paragraph (a) of this section.
§ 533.6 Measurement and calculation procedures.

(a) Any reference to a class of light trucks manufactured by a manufacturer shall be deemed—

(1) To include all light trucks in that class manufactured by persons who control, are controlled by, or are under common control with, such manufacturer; and

(2) To exclude all light trucks in that class manufactured (within the meaning of paragraph (a)(1) of this section) during a model year by such manufacturer which are exported prior to the expiration of 30 days following the end of such model year.

(b) The average fuel economy of all nonpassenger automobiles that are manufactured by a manufacturer and are subject to § 533.5(b) or to § 533.5(c) shall be determined in accordance with procedures established by the Administrator of the Environmental Protection Agency under section 503(a)(2) of the Act.

APPENDIX A TO PART 533—EXAMPLE OF CALCULATING COMPLIANCE UNDER § 533.5 PARAGRAPH (g)

Assume a hypothetical manufacturer (Manufacturer X) produces a fleet of light trucks in MY 2008 as follows:

<table>
<thead>
<tr>
<th>Model</th>
<th>Fuel economy</th>
<th>Volume</th>
<th>Footprint</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>27.0</td>
<td>1,000</td>
<td>42.0</td>
</tr>
<tr>
<td>B</td>
<td>25.6</td>
<td>1,500</td>
<td>44.0</td>
</tr>
<tr>
<td>C</td>
<td>25.4</td>
<td>1,000</td>
<td>46.0</td>
</tr>
<tr>
<td>D</td>
<td>22.1</td>
<td>2,000</td>
<td>50.0</td>
</tr>
<tr>
<td>E</td>
<td>22.4</td>
<td>3,000</td>
<td>55.0</td>
</tr>
<tr>
<td>F</td>
<td>20.2</td>
<td>1,000</td>
<td>66.0</td>
</tr>
</tbody>
</table>
NOTE TO APPENDIX A TABLE 1. Manufacturer X’s required corporate average fuel economy level under §533.5(g) would be calculated by first determining the fuel economy target applicable to each vehicle as illustrated in “Appendix A Figure 1.”

<table>
<thead>
<tr>
<th>Model</th>
<th>Footprint (ft²)</th>
<th>MY 2008 fuel economy target (mpg)</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>42.0</td>
<td>26.20</td>
</tr>
<tr>
<td>B</td>
<td>44.0</td>
<td>25.50</td>
</tr>
<tr>
<td>C</td>
<td>46.0</td>
<td>24.80</td>
</tr>
<tr>
<td>D</td>
<td>50.0</td>
<td>23.30</td>
</tr>
<tr>
<td>E</td>
<td>55.0</td>
<td>21.70</td>
</tr>
<tr>
<td>F</td>
<td>66.0</td>
<td>20.30</td>
</tr>
</tbody>
</table>

NOTE TO APPENDIX A FIGURE 1. Accordingly, vehicle models A, B, C, D, E, and F would be compared to fuel economy values of 26.20, 25.50, 24.80, 23.30, 21.70, and 20.30 mpg, respectively. With the appropriate fuel economy targets calculated, Manufacturer X’s required fuel economy would be calculated as illustrated in “Appendix A Figure 2.”

### Appendix A Figure 2

Manufacturer’s Light Truck Production for Applicable Model Year

<table>
<thead>
<tr>
<th>Model A Volume +</th>
<th>Model B Volume +</th>
<th>Model C Volume +</th>
<th>Model D Volume +</th>
<th>Model E Volume +</th>
<th>Model F Volume +</th>
</tr>
</thead>
<tbody>
<tr>
<td>Model A Target +</td>
<td>Model B Target +</td>
<td>Model C Target +</td>
<td>Model D Target +</td>
<td>Model E Target +</td>
<td>Model F Target +</td>
</tr>
</tbody>
</table>

= 1,000 + 1,500 + 1,000 + 2,000 + 3,000 + 1,000

= 26.20 + 25.50 + 24.80 + 23.30 + 21.70 + 20.30

= 23.1 mpg

### Appendix A Figure 3

Manufacturer’s Light Truck Production for Applicable Model Year

<table>
<thead>
<tr>
<th>Model A Volume +</th>
<th>Model B Volume +</th>
<th>Model C Volume +</th>
<th>Model D Volume +</th>
<th>Model E Volume +</th>
<th>Model F Volume +</th>
</tr>
</thead>
</table>

= 9,500

= 27.0 + 25.6 + 25.4 + 22.1 + 22.4 + 20.2

= 23.2 mpg

NOTE TO APPENDIX A FIGURE 3. Since the actual average fuel economy of Manufacturer X’s fleet is 23.2 mpg, as compared to its required fuel economy level of 23.1 mpg, Manufacturer X complies with the Reformed CAFE standard for MY 2008 as set forth in §533.7(g).

[71 FR 17677, Apr. 6, 2006; 71 FR 19451, Apr. 14, 2006]
PART 534—RIGHTS AND RESPONSIBILITIES OF MANUFACTURERS IN THE CONTEXT OF CHANGES IN CORPORATE RELATIONSHIPS

Sec. 534.1 Scope. 534.2 Applicability. 534.3 Definitions. 534.4 Successors and predecessors. 534.5 Manufacturers within control relationships. 534.6 Reporting corporate transactions. 535.7 Situations not directly addressed by this part.

SOURCE: 69 FR 77671, Dec. 28, 2004, unless otherwise noted.

§ 534.1 Scope.
This part defines the rights and responsibilities of manufacturers in the context of changes in corporate relationships for purposes of the automotive fuel economy program established by 49 U.S.C. Chapter 329.

§ 534.2 Applicability.
This part applies to manufacturers of passenger automobiles and non-pas-senger automobiles.

§ 534.3 Definitions.
(a) Statutory definitions and terms. All terms used in 49 U.S.C. Chapter 329 are used according to their statutory meaning.
(b) As used in this part—
“Control relationship” means the relationship that exists between manufacturers that control, are controlled by, or are under common control with, one or more other manufacturers.
“Predecessor” means a manufacturer whose rights have been vested in and whose burdens have been assumed by another manufacturer.
“Successor” means a manufacturer that has become vested with the rights and assumed the burdens of another manufacturer.

§ 534.4 Successors and predecessors.
For purposes of the automotive fuel economy program, “manufacturer” includes “predecessors” and “successors” to the extent specified in paragraphs (a) through (d) of this section.

(a) Successors are responsible for any civil penalties that arise out of fuel economy shortfalls incurred and not satisfied by predecessors.
(b) If one manufacturer has become the successor of another manufacturer during a model year, all of the vehicles produced by those manufacturers during the model year are treated as though they were manufactured by the same manufacturer. A manufacturer is considered to have become the successor of another manufacturer during a model year if it is the successor on September 30 of the corresponding calendar year and was not the successor for the preceding model year.
(c) Credits earned by a predecessor may be used by a successor, subject to availability of the credits and the general three-year restriction on carrying credits forward and the general three-year restriction on carrying credits backward.
(d) Credits earned by a successor may be used to offset a predecessor’s shortfall, subject to availability of the credits and the general three-year restriction on carrying credits backward.

§ 534.5 Manufacturers within control relationships.
(a) If a civil penalty arises out of a fuel economy shortfall incurred by a group of manufacturers within a control relationship, each manufacturer within that group is jointly and severally liable for the civil penalty.
(b) A manufacturer is considered to be within a control relationship for an entire model year if and only if it is within that relationship on September 30 of the calendar year in which the model year ends.
(c) Credits of a manufacturer within a control relationship may be used by the group of manufacturers within the control relationship to offset shortfalls, subject to the agreement of the other manufacturers, the availability of the credits, and the general three-year restriction on carrying credits forward or backward.
(d) If a manufacturer within a group of manufacturers is sold or otherwise spun off so that it is no longer within that control relationship, the manufacturer may use credits that were earned by the group of manufacturers within
the control relationship while the manufacturer was within that relationship, subject to the agreement of the other manufacturers, the availability of the credits and the general restriction on carrying credits forward or backward.

(e) Agreements among manufacturers in a control relationship related to the allocation of credits or liabilities addressed by this section shall be filed with the agency within 60 days of the end of each model year in the same form as specified in section 534.6. The manufacturers may seek confidential treatment for information provided in the certified report in accordance with 49 CFR Part 512.

§ 534.6 Reporting corporate transactions.

Manufacturers who have entered into written contracts transferring rights and responsibilities such that a different manufacturer owns the controlling stock or exerts control over the design, production or sale of automobiles to which a Corporate Average Fuel Economy standard applies shall report the contract to the agency as follows:

(a) The manufacturers must file a certified report with the agency affirmatively stating that the contract transfers rights and responsibilities between them such that one manufacturer has assumed a controlling stock ownership or control over the design, production or sale of vehicles. The report must also specify the first full model year to which the transaction will apply.

(b) Each report shall—

(i) Identify each manufacturer;

(ii) State the full name, title, and address of the official responsible for preparing the report;

(iii) Identify the production year being reported on;

(iv) Be written in the English language; and

(v) Be submitted to: Administrator, National Highway Traffic Safety Administration, 400 Seventh Street, SW., Washington, DC 20590.

(c) The manufacturers may seek confidential treatment for information provided in the certified report in accordance with 49 CFR part 512.

§ 534.7 Situations not directly addressed by this part.

To the extent that this part does not directly address an issue concerning the rights and responsibilities of manufacturers in the context of a change in corporate relationships, the agency will make determinations based on interpretation of the statute and the principles reflected in the part.

PART 535—3-YEAR CARRYFORWARD AND CARRYBACK OF CREDITS FOR LIGHT TRUCKS

Sec.
535.1 Scope.
535.2 Applicability.
535.3 Definitions.
535.4 3-year carryforward and carryback of credits.

SOURCE: 45 FR 83235, Dec. 19, 1980, unless otherwise noted.

§ 535.1 Scope.

This part establishes regulations governing 3-year carryforward and carryback of credits for manufacturers of light trucks.

§ 535.2 Applicability.

This part applies to manufacturers of light trucks.

§ 535.3 Definitions.

(a) Statutory terms. The terms average fuel economy, average fuel economy standard, fuel economy, manufacture, manufacturer, and model year are used as defined in section 501 of the Act.

(2) Administrator means the Administrator of the National Highway Traffic Safety Administration.

(3) The term light truck is used in accordance with the determinations in parts 523 and 533 of this chapter.

(4) The term class of light trucks is used in accordance with the determinations in part 533 of this chapter.

105
§ 535.4 3-year carryforward and carryback of credits

(a) For purposes of this part, credits under this section shall be considered to be available to any manufacturer upon the completion of the model year in which such credits are earned under paragraph (b) of this section unless under paragraph (c) of this section the credits are made available for use at a time prior to the model year in which earned.

(b) Whenever the average fuel economy for a class of light trucks manufactured by a manufacturer in a particular model year exceeds an applicable average fuel economy standard established in part 533 of this chapter, such manufacturer shall be entitled to credit, calculated under paragraph (c) of this section, which—

(1) Shall be available to be taken into account with respect to the average fuel economy for the same class of light trucks of that manufacturer for any of the three consecutive model years immediately prior to the model year in which such manufacturer exceeds such applicable average fuel economy standard, and

(2) To the extent that such credit is not so taken into account pursuant to paragraph (b)(1) of this section, shall be available to be taken into account with respect to the average fuel economy for the same class of light trucks of that manufacturer for any of the three consecutive model years immediately following the model year in which such manufacturer exceeds such applicable average fuel economy standard.

(c) (1) At any time prior to the end of any model year, a manufacturer which has reason to believe that its average fuel economy for a class of light trucks will be below such applicable standard for that model year may submit a plan demonstrating that such manufacturer will earn sufficient credits under paragraph (b) of this section within the next 3 model years which when taken into account would allow the manufacturer to meet that standard for the model year in which earned.

(2) Such credits shall be available for the model year involved subject to—

(i) The Administrator approving such plan; and

(ii) The manufacturer earning credits in accordance with such plan.

(3) The Administrator approves any such plan unless the Administrator finds that it is unlikely that the plan will result in the manufacturer earning sufficient credits to allow the manufacturer to meet the standard for the model year involved.

(4) The Administrator provides notice to any manufacturer in any case in which the average fuel economy of that manufacturer is below the applicable standard under part 533 of this chapter, after taking into account credits available under paragraph (b)(1) of this section, and affords the manufacturer a reasonable period (of not less than 60 days) in which to submit a plan under this paragraph.

(d) The amount of credit to which a manufacturer is entitled under this section shall be equal to—

(1) The number of tenths of a mile per gallon by which the average fuel economy for a class of light trucks manufactured by such manufacturer in the model year in which the credit is earned pursuant to this section exceeds the applicable average fuel economy standard established in part 533 of this chapter, multiplied by

(2) The total number of light trucks in that class manufactured by such manufacturer during such model year.

(e) The Administrator takes credits into account for any model year on the basis of the number of tenths of a mile per gallon by which the manufacturer involved was below an applicable average fuel economy standard for a class of light trucks for that model year and the volume of that class of light trucks manufactured that model year by the manufacturer. Credits may not be applied between class of light trucks, except as determined by the Administrator to account for changes made in the definitions of classes between model years. Credits once taken into account for any model year shall not thereafter be available for any other model year. Prior to taking any credit into account, the Administrator provides the manufacturer involved with written notice and reasonable opportunity to comment thereon.
PART 537—AUTOMOTIVE FUEL ECONOMY REPORTS

Sec. 537.1 Scope.
537.2 Purpose.
537.3 Applicability.
537.4 Definitions.
537.5 General requirements for reports.
537.6 General content of reports.
537.7 Pre-model year and mid-model year reports.
537.8 Supplementary reports.
537.9 Determination of fuel economy values and average fuel economy.
537.10 Incorporation by reference.
537.11 Public inspection of information.
537.12 Confidential information.

SOURCE: 47 FR 34986, Aug. 12, 1982, unless otherwise noted.

§ 537.1 Scope.
This part establishes requirements for automobile manufacturers to submit reports to the National Highway Traffic Safety Administration regarding their efforts to improve automotive fuel economy.

§ 537.2 Purpose.
The purpose of this part is to obtain information to aid the National Highway Traffic Safety Administration in valuating automobile manufacturers’ plans for complying with average fuel economy standards and in preparing an annual review of the average fuel economy standards.

§ 537.3 Applicability.
This part applies to automobile manufacturers, except for manufacturers subject to an alternate fuel economy standard under section 501 of the Act.

§ 537.4 Definitions.
(a) Statutory terms. (1) The terms average fuel economy standard, fuel, manufacture, and model year are used as defined in section 501 of the Act.
(2) The term manufacturer is used as defined in section 501 of the Act and in accordance with part 529 of this chapter.
(3) The terms average fuel economy, fuel economy, and model type are used as defined in subpart A of 40 CFR part 600.
(4) The terms automobile, automobile capable of off-highway operation, and passenger automobile are used as defined in section 501 of the Act and in accordance with the determinations in part 523 of this chapter.
(b) Other terms. (1) The term loaded vehicle weight is used as defined in subpart A of 40 CFR part 86.
(2) The terms axle ratio, base level, body style, car line, combined fuel economy, engine code, equivalent test weight, gross vehicle weight, inertia weight, transmission class, and vehicle configuration are used as defined in subpart A of 40 CFR part 600.
(3) The term light truck is used as defined in part 523 of this chapter and in accordance with determinations in that part.
(4) The terms approach angle, axle clearance, brakeover angle, cargo carrying volume, departure angle, passenger carrying volume, running clearance, and temporary living quarters are used as defined in part 523 of this chapter.
(5) The term incomplete automobile manufacturer is used as defined in part 529 of this chapter.
(6) As used in this part, unless otherwise required by the context:
(ii) Administrator means the Administrator of the National Highway Traffic Safety Administration or the Administrator’s delegate.
(iii) Current model year means:
(A) In the case of a pre-model year report, the full model year immediately following the period during which that report is required by §537.5(b) to be submitted.
(B) In the case of a mid-model year report, the model year during which that report is required by §537.5(b) to be submitted.
(iv) Average means a production-weighted harmonic average.
(v) Total drive ratio means the ratio of an automobile’s engine rotational speed (in revolutions per minute) to the automobile’s forward speed (in miles per hour).
§ 537.5  General requirements for reports.

(a) For each current model year, each manufacturer shall submit a pre-model year report, a mid-model year report, and, as required by §537.8, supplementary reports.

(b)(1) The pre-model year report required by this part for each current model year must be submitted during the month of December (e.g., the pre-model year report for the 1983 model year must be submitted during December, 1982).

(2) The mid-model year report required by this part for each current model year must be submitted during the month of July (e.g., the mid-model year report for the 1983 model year must be submitted during July 1983).

(3) Each supplementary report must be submitted in accordance with §537.8(c).

(c) Each report required by this part must:

(1) Identify the report as a pre-model year report, mid-model year report, or supplementary report as appropriate;

(2) Identify the manufacturer submitting the report;

(3) State the full name, title, and address of the official responsible for preparing the report;

(4) Be submitted in 10 copies to: Administrator, National Highway Traffic Safety Administration, 400 Seventh Street SW., Washington, DC 20590;

(5) Identify the current model year;

(6) Be written in the English language; and

(7)(i) Specify any part of the information or data in the report that the manufacturer believes should be withheld from public disclosure as trade secret or other confidential business information.

(ii) With respect to each item of information or data requested by the manufacturer to be withheld under 5 U.S.C. 552(b)(4) and 2005(d)(1), the manufacturer shall:

(A) Show that the item is within the scope of sections 552(b)(4) and 2005(d)(1);

(B) Show that disclosure of the item would result in significant competitive damage;

(C) Specify the period during which the item must be withheld to avoid that damage; and

(D) Show that earlier disclosure would result in that damage.

(d) Each report required by this part must be based upon all information and data available to the manufacturer 30 days before the report is submitted to the Administrator.

§ 537.6  General content of reports.

(a) Pre-model year and mid-model year reports. Except as provided in paragraph (c) of this section, each pre-model year report and the mid-model year report for each model year must contain the information required by §537.7(a).

(b) Supplementary report. Each supplementary report must contain the information required by §537.8(b) (1), (2), or (3), as appropriate.

(c) Exceptions. (1) The pre-model year report is not required to contain the information specified in §537.7 (b), (c) (1) and (2), or (c)(4) (xiv) and (xx) if that report is required to be submitted before the fifth day after the date by which the manufacturer must submit the preliminary determination of its average fuel economy for the current model year to the Environmental Protection Agency under 40 CFR 600.506, when such determination is required. Each manufacturer that does not include information under the exception in the immediately preceding sentence shall indicate in its report the date by which it must submit that preliminary determination.

(2) The pre-model year report and the mid-model year report submitted by an incomplete automobile manufacturer for any model year are not required to contain the information specified in §537.7(c)(4) (xv) through (xviii) and (c)(5). The information provided by the incomplete automobile manufacturer under §537.7(c) shall be according to base level instead of model type or carline.

§ 537.7  Pre-model year and mid-model year reports.

(a)(1) Provide the information required by paragraphs (b) and (c) of this section for the manufacturer’s passenger automobiles for the current model year.
(2) After providing the information required by paragraph (a)(1) of this section provide the information required by paragraphs (b) and (c) for this section of each class, as specified in part 333 of this chapter, of the manufacturer's light trucks for the current model year.

(b) Projected average fuel economy. (1) State the projected average fuel economy for the manufacturer's automobiles determined in accordance with §537.9 and based upon the fuel economy values and projected sales figures provided under paragraph (c)(2) of this section.

(2) State the projected final average fuel economy that the manufacturer anticipates having if changes implemented during the model year will cause that average to be different from the average fuel economy projected under paragraph (b)(1) of this section.

(3) State whether the manufacturer believes that the projection it provides under paragraph (b)(2) of this section, or if it does not provide an average under that paragraph, the projection it provides under paragraph (a)(1) of this section sufficiently represents the manufacturer's average fuel economy for the current model year for the purposes of the Act. In the case of a manufacturer that believes that the projection is not sufficiently representative for those purposes, state the specific nature of any reason for the insufficiency and the specific additional testing or derivation of fuel economy values by analytical methods believed by the manufacturer necessary to eliminate the insufficiency and any plans of the manufacturer to undertake that testing or derivation voluntarily and submit the resulting data to the Environmental Protection Agency under 40 CFR 600.509.

(c) Model type and configuration fuel economy and technical information. (1) For each model type of the manufacturer's automobiles, provide the information specified in paragraph (c)(2) of this section in tabular form. List the model types in order of increasing average inertia weight from top to bottom down the left side of the table and list the information categories across the top of the table.

(2)(i) Combined fuel economy; and
(ii) Projected sales for the current model year and total sales of all model types.

(3) (Pre-model year report only.) For each vehicle configuration whose fuel economy was used to calculate the fuel economy values for a model type under paragraph (c)(2) of this section, provide the information specified in paragraph (c)(4) of this section either in tabular form or as a fixed format computer tape. If a tabular form is used then list the vehicle configurations, by model type in the order listed under paragraph (c)(2) of this section, from top to bottom down the left of the table and list the information categories across the top of the table from left to right in the order specified in paragraph (c)(4) of this section. Other formats (such as copies of EPA reports) which contain all the required information in a readily identifiable form are also acceptable. If a computer tape is used, any NHTSA approved fixed format structure may be used, but each vehicle configuration record should identify the manufacturer, model type, and for light trucks the drive wheel code, e.g., 2 or 4 wheel drive. At least the information categories specified here and in paragraph (c)(4) of this section must be provided, but if preferred the tape may contain any additional categories. Each computer tape record must contain all the required categories of information to enable direct reading and interpretation in the fixed format that was approved. There should be no titles, column headings, page numbers, or attachment numbers on the tape. It must be possible to directly calculate and produce the tables specified in paragraph (c)(1) of this section from the records on this tape.

(4)(i) Loaded vehicle weight;
(ii) Equivalent test weight;
(iii) Engine displacement, liters;
(iv) SAE net rated power, kilowatts;
(v) SAE net horsepower;
(vi) Engine code;
(vii) Fuel system (number of carburetor barrels or, if fuel injection is used, so indicate);
(viii) Emission control system;
(ix) Transmission class;
(x) Number of forward speeds;  
(xi) Existence of overdrive (indicate yes or no);  
(xii) Total drive ratio (N/V);  
(xiii) Axle ratio;  
(xiv) Combined fuel economy;  
(xv) Projected sales for the current model year;  
(xvi)(A) In the case of passenger automobiles:  
(1) Interior volume index, determined in accordance with subpart D of 40 CFR part 600, and  
(2) Body style;  
(B) In the case of light trucks:  
(1) Passenger-carrying volume,  
(2) Cargo-carrying volume;  
(3) Beginning model year 2008, track width as defined in 49 CFR 523.2;  
(4) Beginning model year 2008, wheel-base as defined in 49 CFR 523.2, and  
(5) Beginning model year 2008, footprint as defined in 49 CFR 523.2  
(xvii) Performance of the function described in §523.5(a)(5) of this chapter (indicate yes or no);  
(xviii) Existence of temporary living quarters (indicate yes or no);  
(xix) Frontal area;  
(xx) Road load power at 50 miles per hour, if determined by the manufacturer for purposes other than compliance with this part to differ from the road load setting prescribed in 49 CFR 86.177–11(d);  
(xxii) Optional equipment that the manufacturer is required under 40 CFR parts 86 and 600 to have actually installed on the vehicle configuration, or the weight of which must be included in the curb weight computation for the vehicle configuration, for fuel economy testing purposes.  
(5) For each model type of automobile which is classified as an automobile capable of off-highway operation under part 523 of this chapter, provide the following data:  
(i) Approach angle;  
(ii) Departure angle;  
(iii) Breakover angle;  
(iv) Axle clearance;  
(v) Minimum running clearance; and  
(vi) Existence of 4-wheel drive (indicate yes or no).  
(6) The fuel economy values provided under paragraphs (c) (2) and (4) of this section shall be determined in accordance with §537.9.  
§ 537.8 Supplementary reports.  
(a)(1) Except as provided in paragraph (d) of this section, each manufacturer whose most recently submitted semiannual report contained an average fuel economy projection under §537.7(b)(2) or, if no average fuel economy was projected under that section, under §537.7(b)(1), that was not less than the applicable average fuel economy standard and who now projects an average fuel economy which is less than the applicable standard shall file a supplementary report containing the information specified in paragraph (b)(1) of this section.  
(2) Except as provided in paragraph (d) of this section, each manufacturer that determines that its average fuel economy for the current model year as projected under §537.7(b)(2) or, if no average fuel economy was projected under that section, as projected under §537.7(b)(1), is less representative than the manufacturer previously reported it to be under §537.7(b)(3), this section, or both, shall file a supplementary report containing the information specified in paragraph (b)(2) of this section.  
(3) Each manufacturer whose pre-model year report omits any of the information specified in §537.7 (b), (c) (1) and (2), or (c)(4) (xvi) and (xxiv) shall file supplementary report containing the information specified in paragraph (b)(3) of this section.  
(b)(1) The supplementary report required by paragraph (a)(1) of this section must contain:  
(i) Such revisions of and additions to the information previously submitted by the manufacturer under this part regarding the automobiles whose projected average fuel economy has decreased as specified in paragraph (a)(1) of this section as are necessary—  
(A) To reflect the decrease and its cause;  
(B) To indicate a new projected average fuel economy based upon these additional measures.  
(ii) An explanation of the cause of the decrease in average fuel economy
that led to the manufacturer’s having to submit the supplementary report required by paragraph (a)(1) of this section.

(2) The supplementary report required by paragraph (a)(2) of this section must contain:

(i) A statement of the specific nature of and reason for the insufficiency in the representativeness of the projected average fuel economy;

(ii) A statement of specific additional testing or derivation of fuel economy values by analytical methods believed by the manufacturer necessary to eliminate the insufficiency; and

(iii) A description of any plans of the manufacturer to undertake that testing or derivation voluntarily and submit the resulting data to the Environmental Protection Agency under 40 CFR 600.509.

(3) The supplementary report required by paragraph (a)(3) of this section must contain:

(i) All of the information omitted from the pre-model year report under §537.6(c)(2); and

(ii) Such revisions of and additions to the information submitted by the manufacturer in its pre-model year report regarding the automobiles produced during the current model year as are necessary to reflect the information provided under paragraph (c)(1) of this section.

(c)(1) Each report required by paragraph (a)(1) or (2) of this section must be submitted in accordance with §537.5(c) not more than 45 days after the date on which the manufacturer determined, or could have, with reasonable diligence, determined that a report is required under paragraph (a)(1) or (2) of this section.

(2) Each report required by paragraph (a)(3) of this section must be submitted in accordance with §537.5(c) not later than five days after the day by which the manufacturer is required to submit a preliminary calculation of its average fuel economy for the current model year to the Environmental Protection Agency under 40 CFR 600.506.

(d) A supplementary report is not required to be submitted by the manufacturer under paragraph (a)(1) or (2) of this section:

(1) With respect to information submitted under this part before the most recent semiannual report submitted by the manufacturer under this part, or

(2) When the date specified in paragraph (c) of this section occurs:

(i) During the 60-day period immediately preceding the day by which the mid-model year report for the current model year must be submitted by the manufacturer under this part, or

(ii) After the day by which the pre-model year report for the model year immediately following the current model year must be submitted by the manufacturer under this part.

(e) Reporting compliance option in model years 2008–2010. For model years 2008, 2009, and 2010, each manufacturer of light trucks, as that term is defined in 49 CFR 523.5, shall submit a report, not later than 45 days following the end of the model year, indicating whether the manufacturer is opting to comply with 49 CFR 533.5(f) or 49 CFR 533.5(g).

[47 FR 34986, Aug. 12, 1982, as amended at 71 FR 17678, Apr. 6, 2006]
§ 537.10 Base level and model type fuel economy values. For each base level and model type, the manufacturer shall submit a fuel economy value based on the values submitted under paragraph (a) of this section and calculated in the same manner as base level and model type fuel economy values are calculated for use under subpart F of 40 CFR part 600.

(c) Average fuel economy. Average fuel economy must be based upon fuel economy values calculated under paragraph (b) of this section for each model type and must be calculated in accordance with 40 CFR 600.506, using the configurations specified in 40 CFR 600.506(a)(2), except that fuel economy values for running changes and for new base levels are required only for those changes made or base levels added before the average fuel economy is required to be submitted under this part.

§ 537.11 Public inspection of information.

Except as provided in §537.12, any person may inspect the information and data submitted by a manufacturer under this part in the docket section of the National Highway Traffic Safety Administration. Any person may obtain copies of the information available for inspection under this section in accordance with the regulations of the Secretary of Transportation in part 7 of this title.

§ 537.12 Confidential information.

(a) Information made available under §537.11 for public inspection does not include information for which confidentiality is requested under §537.5(c)(7), is granted in accordance with section 505 of the Act and section 552(b) of Title 5 of the United States Code and is not subsequently released under paragraph (c) of this section in accordance with section 505 of the Act.

(b) Denial of confidential treatment. When the Administrator denies a manufacturer’s request under §537.5(c)(7) for confidential treatment of information, the Administrator gives the manufacturer written notice of the denial and reasons for it. Public disclosure of the information is not made until after the ten-day period immediately following the giving of the notice.

(c) Release of confidential information. After giving written notice to a manufacturer and allowing ten days, when feasible, for the manufacturer to respond, the Administrator may make available for public inspection any information submitted under this part that is relevant to a proceeding under the Act, including information that was granted confidential treatment by the Administrator pursuant to a request by the manufacturer under §537.5(c)(7).

PART 538—MANUFACTURING INCENTIVES FOR ALTERNATIVE FUEL VEHICLES

Sec.
538.1 Scope.
538.2 Purpose.
538.3 Applicability.
538.4 Definitions.
538.5 Minimum driving range.
538.6 Measurement of driving range.
538.7 Petitions for reduction of minimum driving range.
538.8 Gallon Equivalents for Gaseous Fuels.
538.9 Dual fuel vehicle incentive.

SOURCE: 61 FR 14511, Apr. 2, 1996, unless otherwise noted.
§ 538.1 Scope.
This part establishes minimum driving range criteria to aid in identifying passenger automobiles that are dual-fueled automobiles. It also establishes gallon equivalent measurements for gaseous fuels other than natural gas. This part also extends the dual-fuel incentive program.

[69 FR 7703, Feb. 19, 2004]

§ 538.2 Purpose.
The purpose of this part is to specify one of the criteria in 49 U.S.C. chapter 329 “Automobile Fuel Economy” for identifying dual-fueled passenger automobiles that are manufactured in model years 1993 through 2004. The fuel economy of a qualifying vehicle is calculated in a special manner so as to encourage its production as a way of facilitating a manufacturer’s compliance with the Corporate Average Fuel Economy Standards set forth in part 531 of this chapter. The purpose is also to establish gallon equivalent measurements for gaseous fuels other than natural gas. This part also specifies the model years after 2004 in which the fuel economy of dual-fueled automobiles may be calculated under the special incentive provisions found in 49 U.S.C. 32905(b) and (d).

[69 FR 7703, Feb. 19, 2004]

§ 538.3 Applicability.
This part applies to manufacturers of automobiles.

§ 538.4 Definitions.
(a) Statutory terms.
(1) The terms alternative fuel, alternative fueled automobile, and dual fueled automobile, are used as defined in 49 U.S.C. 32901(a).
(2) The terms automobile and passenger automobile, are used as defined in 49 U.S.C. 32901(a), and in accordance with the determinations in part 523 of this chapter.
(3) The term manufacturer is used as defined in 49 U.S.C. 32901(a)(13), and in accordance with part 529 of this chapter.
(4) The term model year is used as defined in 49 U.S.C. 32901(a)(15).
(b)(1) Other terms. The terms average fuel economy, fuel economy, and model type are used as defined in subpart A of 40 CFR part 600.
(2) The term EPA means the U.S. Environmental Protection Agency.

§ 538.5 Minimum driving range.
(a) The minimum driving range that a passenger automobile must have in order to be treated as a dual fueled automobile pursuant to 49 U.S.C. 32901(c) is 200 miles when operating on its nominal usable fuel tank capacity of the alternative fuel, except when the alternative fuel is electricity.

(b) The minimum driving range that a passenger automobile using electricity as an alternative fuel must have in order to be treated as a dual fueled automobile pursuant to 49 U.S.C. 32901(c) is 7.5 miles on its nominal storage capacity of electricity when operated on the EPA urban test cycle and 10.2 miles on its nominal storage capacity of electricity when operated on the EPA highway test cycle.

§ 538.6 Measurement of driving range.
The driving range of a passenger automobile model type not using electricity as an alternative fuel is determined by multiplying the combined EPA urban/highway fuel economy rating when operating on the alternative fuel, by the nominal usable fuel tank capacity (in gallons), of the fuel tank containing the alternative fuel. The combined EPA urban/highway fuel economy rating is the value determined by the procedures established by the Administrator of the EPA under 49 U.S.C. 32904 and set forth in 40 CFR part 600. The driving range of a passenger automobile model type using electricity as an alternative fuel is determined by operating the vehicle in the electric-only mode of operation through the EPA urban cycle on its nominal storage capacity of electricity and the EPA highway cycle on its nominal storage capacity of electricity. Passenger automobile types using electricity as an alternative fuel that have completed the EPA urban cycle after recharging and the EPA highway cycle after recharging shall be
§ 538.7 Petitions for reduction of minimum driving range.

(a) A manufacturer of a model type of passenger automobile capable of operating on both electricity and either gasoline or diesel fuel may petition for a reduced minimum driving range for that model type in accordance with paragraphs (b) and (c) of this section.

(b) Each petition shall:
   (1) Be addressed to: Administrator, National Highway Traffic Safety Administration, 400 Seventh Street SW, Washington, DC 20590.
   (2) Be submitted not later than the beginning of the first model year in which the petitioner seeks to have the model type treated as an electric dual fueled automobile.
   (3) Be written in the English language.
   (4) State the full name, address, and title of the official responsible for preparing the petition, and the name and address of the petitioner.
   (5) Set forth in full data, views, and arguments of the petitioner, including the information and data specified in paragraph (c) of this section, and the calculations and analyses used to develop that information and data. No documents may be incorporated by reference in a petition unless the documents are submitted with the petition.
   (6) Specify and segregate any part of the information and data submitted under this section that the petitioner wishes to have withheld from public disclosure in accordance with part 512 of this chapter.

(c) Each petitioner shall include the following information in its petition:
   (1) Identification of the model type or types for which a lower driving range is sought under this section.
   (2) For each model type identified in accordance with paragraph (c)(1) of this section:
      (i) The driving range sought for that model type.
      (ii) The number of years for which that driving range is sought.
      (iii) A description of the model type, including car line designation, engine displacement and type, electric storage capacity, transmission type, and average fuel economy when operating on:
         (A) Electricity; and
         (B) Gasoline or diesel fuel.
      (iv) An explanation of why the petitioner cannot modify the model type so as to meet the generally applicable minimum range, including the steps taken by the petitioner to improve the minimum range of the vehicle, as well as additional steps that are technologically feasible, but have not been taken. The costs to the petitioner of taking these additional steps shall be included.
   (3) A discussion of why granting the petition would be consistent with the following factors:
      (i) The purposes of 49 U.S.C. chapter 329, including encouraging the development and widespread use of electricity as a transportation fuel by consumers, and the production of passenger automobiles capable of being operated on both electricity and gasoline/diesel fuel;
      (ii) Consumer acceptability;
      (iii) Economic practicability;
      (iv) Technology;
      (v) Environmental impact;
      (vi) Safety;
      (vii) Driveability; and
      (viii) Performance.

(d) If a petition is found not to contain the information required by this section, the petitioner is informed about the areas of insufficiency and advised that the petition will not receive further consideration until the required information is received.

(e) The Administrator may request the petitioner to provide information in addition to that required by this section.

(f) The Administrator publishes in the Federal Register a notice of receipt for each petition containing the information required by this section. Any interested person may submit written comments regarding the petition.

(g) In reaching a determination on a petition submitted under this section, the Administrator takes into account:
   (1) The purposes of 49 U.S.C. chapter 329, including encouraging the development and widespread use of alternative
§ 538.8 Gallon Equivalents for Gaseous Fuels.

The gallon equivalent of gaseous fuels, for purposes of calculations made under 49 U.S.C. 32905, are listed in Table I:

* Per gallon unit of measure.

§ 538.9 Dual fuel vehicle incentive.

The application of 49 U.S.C. 32905(b) and (d) to qualifying dual fuel vehicles is extended to the 2005, 2006, 2007, and 2008 model years.

(68 FR 7703, Feb. 19, 2004)
(iii) Light-duty trucks with a gross vehicle weight rating of 6,000 pounds or less, that NHTSA has determined to be high theft in accordance with 49 CFR 542.1; and

(iv) Light duty trucks with a gross vehicle weight rating of 6,000 pounds or less, that NHTSA has determined to be subject to the requirements of this section in accordance with 49 CFR 542.2.

(2) Replacement passenger motor vehicle parts identified in § 541.5(a) for vehicles listed in paragraphs (1)(i) to (iv) of this section.

(b) Exclusions. This standard does not apply to the following:

(1) Passenger motor vehicle parts identified in § 541.5(a) that are present in vehicles manufactured by a motor vehicle manufacturer that manufactures fewer than 5,000 vehicles for sale in the United States each year.

(2) Passenger motor vehicle parts identified in § 541.5(a) that are present in a line with an annual production of not more than 3,500 vehicles.

(3) Passenger motor vehicle parts identified in § 541.5(a) that are present in light-duty trucks with a gross vehicle weight rating of 6,000 pounds or less, that NHTSA has determined to be subject to the requirements of this section in accordance with 49 CFR 542.2, if the vehicle line with which these light-duty trucks share majority of major interchangeable parts is exempt from parts marking requirements pursuant to part 543.

(c) For vehicles listed in subparagraphs (1)(i) to (iv) of this section that are (1) not subject to the requirements of this standard until September 1, 2006, and (2) manufactured between September 1, 2006 and August 31, 2007; a manufacturer needs to meet the requirements of this part 543.

§ 541.4 Definitions.

(a) Statutory terms. All terms defined in 49 U.S.C. chapter 331 are used in accordance with their statutory meanings unless otherwise defined in paragraph (b) of this section.

(b) Other definitions. (1) Interior surface means, with respect to a vehicle part, a surface that is not directly exposed to sun and precipitation.

(2) Light-duty truck (LDT) means a motor vehicle, with motive power, except a trailer, designed primarily for the transportation of property or special purpose equipment, that is rated at 6,000 pounds gross vehicle weight or less.

(3) Line means a name which a manufacturer applies to a group of motor vehicles of the same make which have the same body or chassis, or otherwise are similar in construction or design. A “line” may, for example, include 2-door, 4-door, station wagon, and hatchback vehicles of the same make.

(4) 1990/91 median theft rate means 3.5826 thefts per thousand vehicles produced.

(5) Multipurpose passenger vehicle (MPV) means a passenger motor vehicle which is constructed either on a truck chassis or with special features for occasional off-road operation and which is rated at 6,000 pounds gross vehicle weight or less.

(6) Passenger car is used as defined in § 571.3 of this chapter.

(7) VIN means the vehicle identification number required by part 565 of this chapter.

§ 541.5 Requirements for passenger motor vehicles.

(a) Each passenger motor vehicle subject to this standard must have an identifying number affixed or inscribed on each of the parts specified in paragraphs (a)(1) through (a)(18) inclusive, if the part is present on the passenger motor vehicle. In the case of passenger motor vehicles not originally manufactured to comply with applicable U.S. vehicle safety and bumper standards, each such motor vehicle subject to this standard must have an identifying number inscribed in a manner which conforms to paragraph (d)(2) of this section, on each of the parts specified in paragraphs (a)(1) through (a)(18), inclusive, if the part is present on the motor vehicle.

(1) Engine.

(2) Transmission.

(3) Right front fender.

(4) Left front fender.
(5) Hood.
(6) Right front door.
(7) Left front door.
(8) Right rear door.
(9) Left rear door.
(10) Sliding or cargo door(s).
(11) Front bumper.
(12) Rear bumper.
(13) Right rear quarter panel (passenger cars).
(14) Left rear quarter panel (passenger cars).
(15) Right-side assembly (MPVs).
(16) Left-side assembly (MPVs).
(17) Pickup box, and/or cargo box (LDTs).
(18) Rear door(s) (both doors in case of double doors), decklid, tailgate, or hatchback (whichever is present).

(b)(1) Except as provided in paragraphs (b)(2) and (b)(3) of this section, the number required to be inscribed or affixed by paragraph (a) shall be the VIN of the passenger motor vehicle.

(2) In place of the VIN, manufacturers who were marking engines and/or transmissions with a VIN derivative consisting of at least the last eight characters of the VIN on October 24, 1984, may continue to mark engines and/or transmissions with such VIN derivative.

(3) In the case of passenger motor vehicles not originally manufactured to comply with U.S. vehicle safety and bumper standards, the number required to be inscribed by paragraph (a) of this section shall be the original vehicle identification number assigned to the motor vehicle by its original manufacturer in the country where the motor vehicle was originally produced or assembled.

(c) The characteristics of the number required to be affixed or inscribed by paragraph (a) of this section shall satisfy the size and style requirements set forth for vehicle certification labels in §567.4(g) of this chapter.

(d) The number required by paragraph (a) of this section must be affixed by means that comply with paragraph (d)(1) of this section or inscribed by means that comply with paragraph (d)(2) of this section.

(i) Labels. (i) The number must be printed indelibly on a label, and the label must be permanently affixed to the passenger motor vehicle’s part.

(ii) The number must be placed on each part specified in paragraph (a) of this section in a location such that the number is, if practicable, on an interior surface of the part as installed on the vehicle and in a location where it:

(A) Will not be damaged by the use of any tools necessary to install, adjust, or remove the part and any adjoining parts, or any portions thereof;

(B) Is on a portion of the part not likely to be damaged in a collision; and

(C) Will not be damaged or obscured during normal dealer preparation operations (including rustproofing and undercoating).

(iii) The number must be placed on each part specified in paragraph (a) of this section in a location that is visible without further disassembly once the part has been removed from the vehicle.

(iv) The number must be placed entirely within the target area specified by the original manufacturer for that part, pursuant to paragraph (e) of this section, on each part specified in paragraph (a) of this section.

(v) Removal of the label must—

(A) Cause the label to self-destruct by tearing or rendering the number on the label illegible, and

(B) Discernibly alter the appearance of that area of the part where the label was affixed by leaving residual parts of the label or adhesive in that area, so that investigators will have evidence that a label was originally present.

(vi) Alteration of the number on the label must leave traces of the original number or otherwise visibly alter the appearance of the label material.

(vii) The label and the number shall be resistant to counterfeiting.

(viii) The logo or some other unique identifier of the vehicle manufacturer must be placed in the material of the label in a manner such that alteration or removal of the logo visibly alters the appearance of the label.

(2) Other means of identification. (i) Removal or alteration of any portion of the number must visibly alter the appearance of the section of the vehicle part on which the identification is marked.

(ii) The number must be placed on each part specified in paragraph (a) of this section in a location that is visible
without further disassembly once the part has been removed from the vehicle.

(iii) The number must be placed entirely within the target area specified by the original manufacturer for that part, pursuant to paragraph (e) of this section, on each part specified in paragraph (a) of this section.

(e) Target areas. (1) Each manufacturer that is the original producer who installs or assembles the covered major parts on a line shall designate a target area for the identifying numbers to be marked on each part specified in paragraph (a) of this section for each of its lines subject to this standard. The target area shall not exceed 50 percent of the surface area on the surface of the part on which the target area is located.

(2) Each manufacturer subject to paragraph (e)(1) of this section shall, not later than 30 days before the line is introduced into commerce, inform NHTSA in writing of the target areas designated for each line subject to this standard. The information should be submitted to: Administrator, National Highway Traffic Safety Administration, 400 Seventh Street, SW, Washington, DC 20590.

(3) The target areas designated by the original vehicle manufacturer for a part on a line shall be maintained for the duration of the production of such line, unless a restyling of the part makes it no longer practicable to mark the part within the original target area. If there is such a restyling, the original vehicle manufacturer shall inform NHTSA of that fact and the new target area, in accordance with the requirements of paragraph (e)(2) of this section.

§541.6 Requirements for replacement parts.  

(a) Each replacement part for a part specified in §541.5(a) must have the registered trademark of the manufacturer of the replacement part, or some other unique identifier if the manufacturer does not have a registered trademark, and the letter “R” affixed or inscribed on such replacement part by means that comply with §541.5(d), except as provided in paragraph (d) of this section. In the case of replacement parts subject to the marking requirements of this section, which were not originally manufactured for sale in the United States, the importer of the part shall inscribe its registered trademark, or some other unique identifier if the importer does not have a registered trademark, and the letter “R” on the part by means that comply with §541.5(d)(2), except as provided in paragraph (d) of this section.

(b) A replacement part subject to paragraph (a) of this section shall not be marked pursuant to §541.5.

(c) The trademark and the letter “R” required by paragraph (a) of this section must be at least one centimeter high.

(d) The trademark and the letter “R” required by paragraph (a) of this section must be placed entirely within the target area specified by the vehicle manufacturer, pursuant to paragraph (e) of this section.

(e) Target areas. (1) Each manufacturer that is the original producer or assembler of the vehicle for which the replacement part is designed shall designate a target area for the identifying symbols to be marked on each replacement part subject to the requirements of paragraph (a) of this section. Such target areas shall not exceed 25 percent of the surface area of the surface on which the replacement part marking will appear.

(2) The boundaries of the target area designated under paragraph (e)(1) of this section shall be at least 10 centimeters at all points from the nearest boundaries of the target area designated for that part under §541.5(e) of this part.

(3) Each manufacturer subject to paragraph (e)(1) of this section shall inform NHTSA in writing of the target areas designated for each replacement part subject to paragraph (a) of this section, at the same time as it informs the agency of the target area designated for the original equipment parts of the line, pursuant to §541.5(e)(2) of this part. The information should be submitted to: Administrator, National Highway Traffic Safety Administration, 400 Seventh Street, SW, Washington, DC 20590.
(4) The target area designated by the original vehicle manufacturer for the parts subject to the requirements of paragraph (a) of this section shall be maintained for the duration of the production of such replacement part, unless a restyling of the part makes it no longer practicable to mark the part within the original target area. If there is such a restyling, the original vehicle manufacturer shall inform NHTSA of that fact and the new target area, in accordance with the requirements of paragraph (e)(3) of this section.

(f) Each replacement part must bear the symbol “DOT” in letters at least one centimeter high within 5 centimeters of the trademark and of the letter “R”, and entirely within the target area specified under paragraph (d) of this section. The symbol “DOT” constitutes the manufacturer’s certification that the replacement part conforms to the applicable theft prevention standard, and shall be inscribed or affixed by means that comply with paragraph (a) of this section. In the case of replacement parts subject to the requirements of paragraph (a) of this section, which were not originally manufactured for sale in the United States, the importer shall inscribe the “DOT” symbol before the part is imported into the United States.

[66 FR 40625, Aug. 3, 2001]

APPENDIX C TO PART 541—CRITERIA FOR SELECTING LIGHT DUTY TRUCK LINES LIKELY TO HAVE HIGH THEFT RATES

Scope
These criteria specify the factors the Administrator will take into account in determining whether a new line is likely to have a high theft rate, and, therefore, whether such line will be subject to the requirements of this theft prevention standard.

Purpose
The purpose of these criteria is to enable the Administrator to select, by agreement with the manufacturer, if possible, those new lines which are likely to have high theft rates.

Application
These criteria apply to lines of passenger motor vehicles initially introduced into commerce on or after September 1, 2006.

Methodology
These criteria will be applied to each line initially introduced into commerce on or after September 1, 2006. The likely theft rate for such lines will be determined in relation to the national median theft rate for 1990 and 1991. If the line is determined to be likely to have a theft rate above the national median, the Administrator will select such line for coverage under this theft prevention standard.

Criteria
1. Retail price of the vehicle line.
2. Vehicle image or marketing strategy.
PART 542—PROCEDURES FOR SELECTING LIGHT DUTY TRUCK LINES TO BE COVERED BY THE THEFT PREVENTION STANDARD

§ 542.1 Procedures for selecting new light duty truck lines that are likely to have high or low theft rates.

(a) Scope. This section sets forth the procedures for motor vehicle manufacturers and NHTSA to follow in the determination of whether any new light duty truck line is likely to have a theft rate above or below the 1990/91 median theft rate.

(b) Application. These procedures apply to each manufacturer that plans to introduce a new light duty truck line into commerce in the United States on or after September 1, 2006, and to each of those new lines.

(c) Procedures. (1) Each manufacturer shall use the criteria in Appendix C of part 541 of this chapter to evaluate each new light duty truck line and to conclude whether the new line is likely to have a theft rate above or below the 1990/91 median theft rate.

(2) For each new light duty truck line, the manufacturer shall submit its evaluations and conclusions made under paragraph (c) of this section, together with the underlying factual information, to NHTSA not less than 15 months before the date of introduction. The manufacturer may request a meeting with the agency during this period to further explain the bases for its evaluations and conclusions.

(3) Within 90 days after its receipt of the manufacturer’s submission under paragraph (c)(2) of this section, the agency independently evaluates the new light duty truck line using the criteria in Appendix C of part 541 of this chapter and, on a preliminary basis, determines whether the new line should or should not be subject to §541.2 of this chapter. NHTSA informs the manufacturer by letter of the agency’s evaluations and determinations, together with the factual information considered by the agency in making them.

(4) The manufacturer may request the agency to reconsider any of its preliminary determinations made under paragraph (c)(3) of this section. The manufacturer shall submit its request to the agency within 30 days of its receipt of the letter under paragraph (c)(3) of this section. The request shall include the facts and arguments underlying the manufacturer’s objections to the agency’s preliminary determinations. During this 30-day period, the manufacturer may also request a meeting with the agency to discuss those objections.

(5) Each of the agency’s preliminary determinations under paragraph (c)(3) of this section shall become final 45 days after the agency sends the letter specified in paragraph (c)(3) of this section unless a request for reconsideration has been received in accordance with paragraph (c)(4) of this section. If such a request has been received, the agency makes its final determinations within 60 days of its receipt of the request. NHTSA informs the manufacturer by letter of those determinations and its response to the request for reconsideration.

[69 FR 17967, Apr. 6, 2004; 69 FR 34613, June 22, 2004]
§ 542.2  Procedures for selecting low theft light duty truck lines with a majority of major parts interchangeable with those of a passenger motor vehicle line.

(a) Scope. This section sets forth the procedures for motor vehicle manufacturers and NHTSA to follow in the determination of whether any light duty truck lines that have or are likely to have a low theft rate have major parts interchangeable with a majority of the covered major parts of a passenger motor vehicle line.

(b) Application. These procedures apply to:

(1) Each manufacturer that produces—
   (i) At least one passenger motor vehicle line identified in 49 CFR 541.3(a)(1) and (2) that has been or will be introduced into commerce in the United States, and
   (ii) At least one light duty truck line that has been or will be introduced into commerce in the United States and that the manufacturer identifies as likely to have a theft rate below the median theft rate; and

(2) Each of those likely sub-median theft rate light duty truck lines.

(c) Procedures. (1) For each light duty truck line that a manufacturer identifies under appendix C of part 541 of this chapter as having or likely to have a theft rate below the median rate, the manufacturer identifies how many and which of the major parts of that line will be interchangeable with the covered major parts of any of its passenger motor vehicle lines.

(2) If the manufacturer concludes that a light duty truck line that has or is likely to have a theft rate below the median theft rate has major parts that are interchangeable with a majority of the covered major parts of a passenger motor vehicle line, the manufacturer determines whether all the vehicles of those lines with sub-median or likely sub-median theft rates will account for more than 90 percent of the total annual production of all of the manufacturer’s lines with those interchangeable parts.

(3) The manufacturer submits its evaluations and conclusions made under paragraphs (c)(1) and (2) of this section, together with the underlying factual information, to NHTSA not less than 15 months before the date of introduction. During this period, the manufacturer may request a meeting with the agency to further explain the bases for its evaluations and conclusions.

(4) Within 90 days after its receipt of the manufacturer’s submission under paragraph (c)(3) of this section, NHTSA considers that submission, if any, and independently makes, on a preliminary basis, the determinations of those light duty truck lines with sub-median or likely sub-median theft rates which should or should not be subject to §541.5 of this chapter. NHTSA informs the manufacturer by letter of the agency’s preliminary determinations, together with the factual information considered by the agency in making them.

(5) The manufacturer may request the agency to reconsider any of its preliminary determinations made under paragraph (c)(4) of this section. The manufacturer must submit its request to the agency within 30 days of its receipt of the letter under paragraph (c)(4) of this section informing it of the agency’s preliminary determinations. The request must include the facts and arguments underlying the manufacturer’s objections to the agency’s preliminary determinations. During this 30-day period, the manufacturer may also request a meeting with the agency to discuss those objections.

(6) Each of the agency’s preliminary determinations made under paragraph (c)(4) of this section becomes final 45 days after the agency sends the letter specified in that paragraph unless a request for reconsideration has been received in accordance with paragraph (c)(5) of this section. If such a request has been received, the agency makes its final determinations within 60 days of its receipt of the request. NHTSA informs the manufacturer by letter of those determinations and its response to the request for reconsideration.

[69 FR 17968, Apr. 6, 2004]
PART 543—EXEMPTION FROM VEHICLE THEFT PREVENTION STANDARD

§ 543.1 Scope.

This part establishes procedures under section 605 of the Motor Vehicle Information and Cost Savings Act (15 U.S.C. 2025) for filing and processing petitions to exempt lines of passenger motor vehicles from part 541 of this chapter, and procedures for terminating or modifying an exemption.

§ 543.2 Purpose.

The purpose of this part is to specify the content and format of petitions which may be filed by manufacturers of passenger motor vehicles to obtain an exemption from the parts-marking requirements of the vehicle theft prevention standard for passenger motor vehicle lines which include, as standard equipment, an antitheft device if the agency concludes that the device is likely to be as effective in reducing and deterring motor vehicle theft as compliance with the parts-marking requirements. This part also provides the procedures that the agency will follow in processing those petitions and in terminating or modifying exemptions.

§ 543.3 Application.

This part applies to manufacturers of vehicles subject to the requirements of part 541 of this chapter, and to any interested person who seeks to have NHTSA terminate an exemption.

§ 543.4 Definitions.

(a) Statutory terms. All terms defined in sections 2, 601, and 605 of the Motor Vehicle Information and Cost Savings Act are used in accordance with their statutory meanings unless otherwise defined in paragraph (b) of this section.

(b) Other definitions.

Line or car line means a name which a manufacturer applies to a group of motor vehicles of the same make which have the same body or chassis, or otherwise are similar in construction or design. A “line” may, for example, include 2-door, 4-door, station wagon, and hatchback vehicles of the same make.

NHTSA means the National Highway Traffic Safety Administration.

§ 543.5 Petition: General requirements.

(a) For each model year, a manufacturer may petition NHTSA for an exemption of one car line from the requirements of part 541 of this chapter. However, for car lines not subject to the requirements of part 541 of this chapter until September 1, 2006, a manufacturer may not petition NHTSA for an exemption for model years before model year 2006.

(b) Each petition filed under this part for an exemption must—

1. Be written in the English language;
2. Be submitted in three copies to: Administrator, National Highway Traffic Safety Administration, 400 Seventh Street, SW., Washington, DC 20590;
3. State the full name and address of the petitioner, the nature of its organization (individual, partnership, corporation, etc.), and the name of the State or country under the laws of which it is organized;
4. Be submitted at least 8 months before the commencement of production of the lines specified under paragraph (5) of §543.5(b) for the first model year in which the petitioner wishes those lines to be exempted, and identify that model year;
5. Identify the passenger motor vehicle line or lines for which exemption is sought;
6. Set forth in full the data, views, and arguments of the petitioner supporting the exemption, including the information specified in §543.6; and
§ 543.6 Petition: Specific content requirements.

(a) Each petition for exemption filed under this part must include:
(1) A statement that an antitheft device will be installed as standard equipment on all vehicles in the line for which an exemption is sought;
(2) A list naming each component in the antitheft system, and a diagram showing the location of each of those components within the vehicle;
(3) A discussion that explains the means and process by which the device is activated and functions, including any aspect of the device designed to—
   (i) Facilitate or encourage its activation by motorists,
   (ii) Attract attention to the efforts of an unauthorized person to enter or move a vehicle by means other than a key,
   (iii) Prevent defeating or circumventing the device by an unauthorized person attempting to enter a vehicle by means other than a key,
   (iv) Prevent the operation of a vehicle which an unauthorized person has entered using means other than a key, and
   (v) Ensure the reliability and durability of the device;
(4) The reasons for the petitioner’s belief that the antitheft device will be effective in reducing and deterring motor vehicle theft, including any theft data and other data that are available to the petitioner and form a basis for that belief;
(5) The reasons for the petitioner’s belief that the agency should determine that the antitheft device is likely to be as effective as compliance with the parts-marking requirements of part 541 in reducing and deterring motor vehicle theft, including any statistical data that are available to the petitioner and form a basis for petitioner’s belief that a line of passenger motor vehicles equipped with the antitheft device is likely to have a theft rate equal to or less than that of passenger motor vehicles of the same, or a similar, line which have parts marked in compliance with part 541.
(b) Any petitioner submitting data under paragraph (a) (4) or (5) of this section shall submit an explanation of its belief that the data are sufficiently representative and reliable to warrant NHTSA’s reliance upon them.

§ 543.7 Processing an exemption petition.

(a) NHTSA processes any complete petition. If a manufacturer submits a petition that does not contain all the information required by this part, NHTSA informs the manufacturer of the areas of insufficiency and advises the manufacturer that the agency does not process the petition until it receives the required information.
(b) The agency grants a petition for an exemption from the parts-marking requirements of part 541 either in whole or in part, if it determines that, based upon substantial evidence, the standard equipment antitheft device is likely to be as effective in reducing and deterring motor vehicle theft as compliance with the parts-marking requirements of part 541.
(c) The agency issues its decision either to grant or deny an exemption petition not later than 120 days after the date on which a complete petition is filed.
(d) Any exemption granted under this part applies only to the vehicle line or lines that are the subject of the grant, and are equipped with the antitheft device on which the line’s exemption was based.
(e) An exemption granted under this part is effective for the model year beginning after the model year in which NHTSA issue the notice of exemption, unless the notice of exemption specifies a later model year.
(f) NHTSA publishes a notice of its decision to grant or deny an exemption petition in the FEDERAL REGISTER, and notifies the petitioner in writing of the agency’s decision.
§ 543.8 Duration of exemption.

Each exemption under this part continues in effect unless it is modified or terminated under § 543.9, or the manufacturer ceases production of the exempted line.

§ 543.9 Terminating or modifying an exemption.

(a) On its own initiative or in response to a petition, NHTSA may commence a proceeding to terminate or modify any exemption granted under this part.

(b) Any interested person may petition the agency to commence a proceeding to terminate or modify an exemption.

(c)(1) In a petition to terminate an exemption, the petitioner must:
   (i) Identify the vehicle line or lines that are the subject of the exemption;
   (ii) State the reasons for petitioner's belief that the standard equipment antitheft device installed under the exemption is not as effective as compliance with the parts-marking requirements of part 541 in reducing and deterring motor vehicle theft;
   (iii) Comply with § 543.5, paragraphs (b)(1) through (3) and (7).

(c)(2) In a petition to modify an exemption, the petitioner must:
   (i) Identify the vehicle line or lines that are the subject of the exemption;
   (ii) Request permission to use an antitheft device similar to, but different from the standard equipment antitheft device which is installed under the exemption;
   (iii) Comply with § 543.5, paragraphs (b)(1) through (3) and (7);
   (iv) Provide the same information for the modified device that is required under § 543.6 for a new device, except that the information specified by § 543.6(a)(3) need by provided only to the extent that the modified device differs from the standard equipment antitheft device installed under the exemption.

(d) NHTSA processes any complete petition. If a person submits a petition under this section that does not contain all the information required by it, NHTSA informs the manufacturer of the areas of insufficiency and advises the manufacturer that the agency does not process the petition until it receives the required information.

(e) If NHTSA denies a petition requesting a proceeding to terminate or modify an exemption, the agency notifies the petitioner by letter.

(f) If NHTSA commences a termination proceeding on its own initiative or in response to a petition, the agency provides the manufacturer of the exempted line with a copy of the petition, if any, a written statement of NHTSA's reasons for commencing the proceeding, and an opportunity to present its written views.

(g)(1) The agency terminates an exemption if it determines that the antitheft device installed under the exemption has not been as effective as parts-marking in reducing and deterring motor vehicle theft.

(2) Except as provided in paragraph (g)(3) of this section, a decision to terminate an exemption under this section takes effect on the later of the following dates:
   (i) The last day of the model year in which NHTSA issues the termination decision, or
   (ii) Six months after the manufacturer receives written notice of the termination.

(3) If a manufacturer shows good cause why terminating its exemption effective on a date later than the one specified in paragraph (g)(2) of this section is consistent with the public interest and the purposes of the Act, the agency may set such later date.

(h)(1) The agency modifies an exemption if it determines, based on substantial evidence, that the modified antitheft device described in the petition is likely to be as effective in reducing and deterring motor vehicle theft as compliance with the parts-marking requirements of part 541.

(2)(i) Except as provided in paragraph (h)(2)(ii) of this section, a decision to modify an exemption under this section takes effect on the first day of the model year following the model year in which NHTSA issued the modification decision.

(ii) If a manufacturer shows good cause why modifying its exemption effective on a date earlier than the one specified in paragraph (h)(2)(i) of this
The purpose of these reporting requirements in this part is to aid in implementing and evaluating the provisions of 49 U.S.C. Chapter 331 Theft Prevention to prevent or discourage the theft of motor vehicles, to prevent or discourage the sale or distribution in interstate commerce of used parts removed from stolen motor vehicles, and to help reduce the cost to consumers of comprehensive insurance coverage for motor vehicles.

§ 544.3 Application.

This part applies to the motor vehicle insurance policy issuers listed in appendices A or B, and to the motor vehicle rental and leasing companies listed in appendix C.

[55 FR 25699, June 22, 1990]

§ 544.4 Definitions.

(a) Statutory terms. All terms defined in 49 U.S.C. 33101 and 33112 are used in accordance with their statutory meanings unless otherwise defined in paragraph (b) of this section.

(b) Other definitions. (1) Comprehensive insurance coverage means the indemnification of motor vehicle owners by an insurer against losses due to fire, theft, robbery, pilferage, malicious mischief and vandalism, and damage resulting from floods, water, tornadoes, cyclones, or windstorms.

(2) Gross vehicle weight rating is used as defined at § 571.3 of this chapter.

(3) Heavy truck means a truck with a gross vehicle weight rating of more than 10,000 pounds.

(4) Light truck means a truck with a gross vehicle weight rating of 10,000 pounds or less.

(5) Major part means—

(i) In the case of passenger motor vehicles, any part listed in § 541.5(a) (1) through (14) of this chapter;

(ii) In the case of light trucks, any part listed in § 541.5(a) (1) through (14) of this chapter, or the cargo bed or transfer case;

(iii) In the case of heavy trucks, any part listed in § 541.5(a) (1) through (14) of this chapter, or the cargo bed, drive axle assembly, fifth wheel, sleeper, or the transfer case;

(iv) In the case of multipurpose passenger vehicles, any part listed in § 541.5(a) (1) through (14) of this chapter, or the cargo bed or transfer case; and

(v) In the case of motorcycles, the crankcase, engine, frame, front fork, or transmission.

(6) Motorcycle is used as defined at § 571.3 of this chapter.
(7) Motorcycle vehicle means a passenger motor vehicle, multipurpose passenger vehicle, truck, or motorcycle.

(8) Multipurpose passenger vehicle is used as defined at §571.3 of this chapter.

(9) Recovery means regaining physical possession of a motor vehicle or a major portion of the superstructure of a motor vehicle with one or more major parts still attached to the superstructure, after that vehicle has been stolen.

(10) Recovery-in-part means a recovery in which one or more of the recovered vehicle’s major parts is missing at the time of recovery.

(11) Recovery intact means a recovery with none of the recovered vehicle’s major parts missing at the time of recovery, and with no apparent damage to any part of the motor vehicle other than those parts damaged in order to enter, start, and operate the vehicle, but with additional mileage and ordinary wear and tear.

(12) Recovery-in-whole means a recovery with none of the recovered vehicle’s major parts missing at the time of recovery, but with apparent damage to some part or parts of the vehicle in addition to those parts damaged in order to enter, start, and operate the vehicle.

(13) Reporting period means the calendar year covered by a report submitted under this part.

(14) Truck is used as defined at §571.3 of this chapter.

(15)(i) In the case of insurers that issue motor vehicle insurance policies, vehicle theft means an actual physical removal of a motor vehicle without the permission of its owner, but does not include the removal of component parts, accessories, or personal belongings from a motor vehicle which is not moved.

(ii) In the case of an insurer which has a fleet of 20 or more vehicles (other than a governmental entity) used primarily for rental or lease and not covered by theft insurance policies issued by insurers of motor vehicles, “vehicle theft” means an actual physical removal of a motor vehicle without the permission of its owner, or keeping possession of the motor vehicle without permission of its owner for a sufficient period of time so that the vehicle could have been reported as stolen to the State police in the State in which the vehicle was to have been returned. However, vehicle theft does not include the removal of component parts, accessories, or personal belongings from a motor vehicle which is not moved.

§ 544.5 General requirements for reports.

(a) Each insurer to which this part applies shall submit a report annually before October 25, beginning on October 25, 1986. This report shall contain the information required by §544.6 of this part for the calendar year 3 years previous to the year in which the report is filed (e.g., the report due by October 25, 2008 will contain the required information for the 2005 calendar year).

(b) Each report required by this part must:

(1) Have a heading preceding its text that includes the words “Insurer Report”;

(2) Identify the insurer, including all subsidiary companies, on whose behalf the report is submitted, and the designated agent, if any, submitting the report or that will submit further documents to complete the report;

(3) Identify the State or States in which the insurer did business during the reporting period;

(4) State the full name and title of the official responsible for preparing the report, and the address of the insurer;

(5) Identify the reporting period covered by the report;

(6) Be written in the English language;

(7) Include a glossary defining all acronyms and terms of art used in the report, unless those acronyms and terms of art are defined immediately after they first appear in the report;

(8) Be submitted in three copies to: Administrator, National Highway Traffic Safety Administration, 400 Seventh Street, S.W., Washington, DC 20590; and

(9) If the insurer wishes to submit certain information under a claim of
§ 544.6 Contents of insurer reports.

(a)(1) In the case of insurers that issue motor vehicle insurance policies, provide the information specified in paragraphs (b) through (g) of this section for each State in which the insurer, including any subsidiary, did business during the reporting period if the insurer is listed in appendix A, or for each State listed after the insurer’s name if the insurer is listed in appendix B.

(2) In the case of a motor vehicle rental or leasing company listed in appendix C, provide the information specified in paragraphs (c), (d)(2)(iv), and (g) of this section for each vehicle type listed in paragraph (b) of this section, for each State in which the company, including any licensee, franchisee, or subsidiary, did business during the reporting period. The information for each listed company shall include all relevant information from any licensee, franchisee, or subsidiary.

(b) For each of the following vehicle types, provide the information specified in paragraphs (c) through (g) of this section for all vehicles of that type insured by the insurer during the reporting period—

(1) Passenger cars.
(2) Multipurpose passenger vehicles.
(3) Light trucks.
(4) Heavy trucks.
(5) Motorcycles.

(c)(1) List the total number of vehicle thefts for vehicles manufactured in the 1983 or subsequent model years, subdivided into model year, model, make, and line, for this type of motor vehicle.

(2) List the total number of recoveries for vehicles manufactured in the 1983 or subsequent model years, subdivided into model year, model, make, and line, for this type of motor vehicle. Beginning with the report due not later than October 25, 1987, for each of these subdivided number of recoveries, indicate how many were:

(i) Recoveries intact;
(ii) Recoveries-in-whole; and
(iii) Recoveries-in-part.

(3) Explain how the theft and recovery data set forth in response to paragraphs (c)(1) and (2) of this section were obtained by the insurer, and the steps taken by the insurer to ensure that these data are accurate and timely.

(4) Explain the use made by the insurer of the information set forth in response to paragraphs (c)(1) and (2) of this section, including the extent to which such information is reported to national, public, and private entities (e.g., the Federal Bureau of Investigation and State and local police). If such reports are made, state the frequency and timing of the reporting.

(d)(1) Provide the rating characteristics used by the insurer to establish the premiums it charges for comprehensive insurance coverage for this type of motor vehicle and the premium penalties for vehicles of this type considered by the insurer as more likely to be stolen. This requirement may be satisfied by furnishing the pertinent sections of the insurer’s rate manual(s).

(2) Provide the loss data used by the insurer to establish the premiums it charges for comprehensive insurance coverage for this type of motor vehicle and the premium penalties it charges for vehicles of this type it considers as more likely to be stolen. This requirement may be satisfied by providing the following:

(i) The total number of comprehensive insurance claims paid by the insurer during the reporting period;
(ii)(A) The total number of claims listed in (d)(2)(i) of this section that arose from a theft;
(B) The insurer’s best estimate of the percentage of the number listed in paragraph (d)(2)(i)(A) of this section that arose from vehicle thefts, and an explanation of the basis for the estimate;
(iii) The total amount (in dollars) paid out by the insurer during the reporting period in response to all the comprehensive claims filed by its policyholders;
(iv)(A) In the case of insurers listed in appendix A or B, provide—

(1) The total amount (in dollars) listed under paragraph (d)(2)(iii) of this section paid out by the insurer as a result of theft; and

(2) The insurer’s best estimate of the percentage of the dollar total listed in paragraph (d)(2)(iv)(A)(1) of this section that arose from vehicle thefts, and an explanation of the basis for the estimate;

(B) In the case of other insurers subject to this part, the net losses suffered by the insurer (in dollars) as a result of vehicle theft;

(v)(A) The total amount (in dollars) recovered by the insurer from the sale of recovered vehicles, major parts recovered not attached to the vehicle superstructure, or other recovered parts, after the insurer had made a payment listed under paragraph (d)(2)(iv) of this section.

(B) The insurer’s best estimate of the percentage of the dollar total listed in paragraph (d)(2)(v)(A) of this section that arose from vehicle thefts, and an explanation of the basis for the estimate;

(vi) An identification of the vehicles for which the insurer charges comprehensive insurance premium penalties, because the insurer considers such vehicles as more likely to be stolen;

(vii) The total number of comprehensive insurance claims paid by the insurer for each vehicle risk grouping identified in paragraph (d)(2)(vi) of this section during the reporting period, and the total amount (in dollars) paid out by the insurer in response to each of the listed claims totals; and

(viii) The maximum premium adjustments (as a percentage of the basic comprehensive insurance premium) made for each vehicle risk grouping identified in paragraph (d)(2)(vi) of this section during the reporting period, as a result of the insurer’s determination that such vehicles are more likely to be stolen.

(3) Identify any other rating rules and plans used by the insurer to establish the premiums and premium penalties.

(4) Explain the basis for the insurer’s comprehensive insurance premiums and the premium penalties charged for motor vehicles it considers as more likely to be stolen. This requirement may be satisfied by providing the pertinent sections of materials filed with State insurance regulatory officials and clearly indicating which information in those sections is being submitted in compliance with this paragraph.

(e) List each action taken by the insurer to reduce the premiums it charges for comprehensive insurance coverage because of a reduction in thefts of this type of motor vehicle. For each action:

(1) State the conditions that must be satisfied to receive such a reduction (e.g., installation of antitheft device, marking of vehicle in accordance with the theft prevention standard, etc.);

(2) State the number of the insurer’s policyholders and the total number of vehicles insured by the insurer that received this reduction; and

(3) State the difference in average comprehensive insurance premiums for those policyholders that received this reduction versus those policyholders that did not receive the reduction.

(f) In the case of an insurer that offered a reduction in its comprehensive insurance premiums for vehicles equipped with antitheft devices, provide:

(1) The specific criteria used by the insurer to determine whether a vehicle is eligible for the reduction (original equipment antitheft device, passive antitheft device, etc.);

(2) The total number of vehicle thefts for vehicles manufactured in the 1983 or subsequent model years that received a reduction under each listed criterion; and

(3) The total number of recoveries of vehicles manufactured in the 1983 or subsequent model years that received a reduction under each listed criterion. Beginning with the report due not later than October 25, 1987, indicate how many of the total number of recoveries were—

(i) Recoveries intact;
§ 544.7 Incorporating previously filed documents.

(a) In any report required by this part, an insurer may incorporate by reference any document or portion thereof previously filed with any Federal or State agency or department within the past four years.

(b) An insurer that incorporates by reference a document not previously submitted to the National Highway Traffic Safety Administration shall append that document or the pertinent sections of that document to its report, and clearly indicate on the cover or first page of the document or pertinent section the regulatory requirement in response to which the document is being submitted.

(c) An insurer that incorporates by reference a document shall clearly identify the document and the specific portions thereof sought to be incorporated, and, in the case of a document previously submitted to the National Highway Traffic Safety Administration, indicate the date on which the document was submitted to the agency and the person whose signature appeared on the document.

APPENDIX A TO PART 544—INSURERS OF MOTOR VEHICLE INSURANCE POLICIES SUBJECT TO THE REPORTING REQUIREMENTS IN EACH STATE IN WHICH THEY DO BUSINESS

Allstate Insurance Group
American Family Insurance Group
American International Group
Auto Club Southern California Group
Auto-Owners Insurance Group
Erie Insurance Group
Berkshire Hathaway/GEICO Corporation Group
California State Auto Group
Hartford Insurance Group
Liberty Mutual Insurance Companies
Metropolitan Life Auto & Home Group
Mercury General Group
Nationwide Group
Progressive Group
Safeco Insurance Companies
State Farm Group
St. Paul Travelers Companies
USAA Group
Farmers Insurance Group

APPENDIX B TO PART 544—ISSUERS OF MOTOR VEHICLE INSURANCE POLICIES SUBJECT TO THE REPORTING REQUIREMENTS ONLY IN DESIGNATED STATES

Alfa Insurance Group (Alabama)
Auto Club (Michigan)
Commerce Group, Inc. (Massachusetts)
Farm Bureau of Idaho Group (Idaho)
Kentucky Farm Bureau Group (Kentucky)
New Jersey Manufacturers Group (New Jersey)
Safety Group (Massachusetts)
Southern Farm Bureau Group (Arkansas, Mississippi)
Tennessee Farmers Companies (Tennessee)

[72 FR 50080, Aug. 30, 2007]

APPENDIX C TO PART 544—MOTOR VEHICLE RENTAL AND LEASING COMPANIES (INCLUDING LICENSEES AND FRANCHISEES) SUBJECT TO THE REPORTING REQUIREMENTS OF PART 544

Cendant Car Rental
Dollar Thrifty Automotive Group
EmKay, Inc.

Indicates a newly listed company which must file a report beginning with the report due October 25, 2008.

Indicates a newly listed company which must file a report beginning with the report due October 25, 2007.
PART 545—FEDERAL MOTOR VEHICLE THEFT PREVENTION STANDARD PHASE-IN AND SMALL-VOLUME LINE REPORTING REQUIREMENTS

§ 545.1 Scope.
This part establishes requirements for manufacturers of motor vehicles to respond to NHTSA inquiries, to submit reports, and to maintain records related to the reports, concerning the number of vehicles that meet the requirements of 49 CFR part 541, and the number of vehicles that are excluded from the requirements of 49 CFR part 541 pursuant to 49 CFR 541.3(b)(2).

§ 545.2 Purpose.
The purpose of these requirements is to assist the National Highway Traffic Safety Administration in determining whether a manufacturer has complied with the requirements of 49 CFR 541.3.

§ 545.3 Applicability.
This subpart applies to manufacturers of motor vehicles.

§ 545.4 Response to inquiries.
(a) At any time prior to August 31, 2007, each manufacturer must, upon request from the Office of Vehicle Safety Compliance, provide information identifying the vehicles (by make, model, and vehicle identification number) that have been certified as complying with the requirements of 49 CFR part 541. The manufacturers designation of a vehicle as a certified vehicle is irrevocable.

(b) At any time prior to August 31, 2007, each manufacturer must, upon request from the Office of Vehicle Safety Compliance, provide information identifying the vehicles (by make, model, and vehicle identification number) that are excluded from the requirements of 49 CFR part 541 pursuant to 49 CFR 541.3(b)(2).

§ 545.5 Definitions.
Production year means the 12-month period between September 1 of 2006 and August 31, 2007, inclusive. Small-volume line means a line with an annual production of not more than 3,500 vehicles.

§ 545.6 Reporting requirements for vehicles listed in § 541.3(a)(1).
(a) General reporting requirements. Within 60 days after the end of the production year ending August 31, 2007, each manufacturer shall submit a report to the National Highway Traffic Safety Administration concerning its compliance with 49 CFR part 541 for vehicles listed in § 541.3(a)(1) that were manufactured between September 1, 2006 and August 31, 2007. Each report must—

(1) Identify the manufacturer;
(2) State the full name, title, and address of the official responsible for preparing the report;
(3) Identify the production year being reported on;
(4) Contain a statement regarding whether or not the manufacturer complied with the requirements of 49 CFR part 541 for the period covered by the report, and the basis for that statement;
§ 545.7 Reporting requirements for vehicles listed in § 541.3(b)(2).

(a) General reporting requirements. Within 60 days after the end of the production year ending August 31, 2007, each manufacturer must submit a report to the National Highway Traffic Safety Administration concerning small-volume lines that were manufactured between September 1, 2006 and August 31, 2007. Each report must—

(1) Identify the manufacturer;
(2) State the full name, title, and address of the official responsible for preparing the report;
(3) Identify the production year being reported on;
(4) Provide the information specified in paragraph (b) of this section;
(5) Be written in the English language; and
(6) Be submitted to: Administrator, National Highway Traffic Safety Administration, Room 400 7th Street, SW., Washington, DC 20590.

(b) Report content—(1) Basis for Statement of Compliance. Each manufacturer shall provide the number of motor vehicles listed in §541.3(a)(1) that were manufactured between September 1, 2006 and August 31, 2007 (excluding those motor vehicles that were subject to the requirements of 49 CFR part 541 before September 1, 2006).

(2) Production. Each manufacturer shall provide (1) the number of motor vehicles manufactured between September 1, 2006 and August 31, 2007 (excluding those motor vehicles that were subject to the requirements of 49 CFR part 541 before September 1, 2006), that meet the requirements of 49 CFR 541.5; and (2) the number of motor vehicles manufactured between September 1, 2006 and August 31, 2007 (excluding those motor vehicles that were subject to the requirements of 49 CFR part 541 before September 1, 2006), that are exempt from 49 CFR part 541 pursuant to 49 CFR part 543.

(3) Statement regarding compliance. Each manufacturer must provide a statement regarding whether or not the manufacturer complied with 49 CFR 541.5 requirements as applicable to the period covered by the report, and the basis for that statement.

[70 FR 28851, May 19, 2005, as amended at 72 FR 46176, Aug. 17, 2007]

§ 545.8 Records.

Each manufacturer shall maintain records of the Vehicle Identification Number for each vehicle for which information is reported under §545.6(b)(2) and §545.7(b)(2) until December 31, 2008.

§ 545.9 Petition to extend period to file report.

A manufacturer may petition for extension of time to submit a report under this part. A petition will be granted only if the petitioner shows good cause for the extension and if the extension is consistent with the public interest. The petition must be received not later than 15 days before expiration of the time stated in §545.5(a). The filing of a petition does not automatically extend the time for filing a report. The petition must be submitted to: Administrator, National Highway Traffic Safety Administration, 400 7th Street, SW., Washington, DC 20590.

METHOD OF SERVICE OF PROCESS

§ 551.66 What is the legal effect of service of process on an agent?

§ 551.67 Where and how may an agent be served?

§ 551.68 What if an agent cannot be served?

Subpart A—General

§ 551.1 Scope.

This part contains rules of procedure generally applicable to the transaction of official business under the National Traffic and Motor Vehicle Safety Act of 1966, the Motor Vehicle Information and Cost Savings Act, and the Highway Safety Act of 1966. These rules apply in addition to the rules governing specific proceedings. In case of inconsistency with these general rules, the specific rules prevail.

Subpart B [Reserved]

Subpart C—Submittals in Writing

§ 551.31 Form of communications.

Any communication in writing relating to official business (including formal documents) shall be on opaque and durable paper not larger than 9 by 14 inches in size. Tables, charts, or originals of other documents that are attached to communications shall be folded to this size, if possible. The left margin of communications shall be at least 1½ inches wide, and if a communication is bound, it shall be bound on the left side. All copies submitted shall be legible.

§ 551.33 Address of communications.

Unless otherwise specified, communications shall be addressed to the Administrator, National Highway Traffic Safety Administration, U.S. Department of Transportation, 400 Seventh Street SW., Washington, DC 20590. Communications may not be addressed to a staff member’s private address.

§ 551.35 Subscription of communications.

Each communication shall be signed in ink and shall disclose the full legal name and the address of the person signing it and, if he is an agent, of his principal.

§ 551.37 Language of communications.

Communications and attachments thereto shall be in English. Any matter written in a foreign language will be considered only if accompanied by a translation into English. A translation shall bear a certificate by the translator certifying that he is qualified to make the translation; that the translation is complete except as otherwise clearly indicated; and that it is accurate to the best of the translator’s knowledge and belief. The translator shall sign the certificate in ink and state his full legal name, occupation, and address.

Subpart D—Service of Process on Foreign Manufacturers and Importers

SOURCE: 70 FR 45567, Aug. 8, 2005, unless otherwise noted.

DESIGNATION OF AN AGENT FOR SERVICE OF PROCESS

§ 551.45 What is the purpose of this subpart?

The purpose of this subpart is to establish a procedure for foreign manufacturers, assemblers and importers of motor vehicles and motor vehicle equipment to designate an agent in the United States on whom service of administrative or judicial notices or processes may be made.

§ 551.46 Who must comply with this subpart and when?

(a) All foreign manufacturers, assemblers, and importers of motor vehicles or motor vehicle equipment (hereinafter referred to as “foreign manufacturers”) must comply with this subpart before offering a motor vehicle or item of motor vehicle equipment for importation into the United States.

(b) Unless and until a foreign manufacturer appoints an agent in accordance with the requirements of this subpart, it may not import motor vehicles or motor vehicle equipment into the United States.

§ 551.47 Who may serve as an agent for a foreign manufacturer?

Only an individual, a domestic firm or a domestic corporation that is a permanent resident of the United States may serve as an agent under this subpart.

§ 551.48 May an official of a foreign manufacturer serve as its agent?

(a) Generally no; an agent must be a permanent resident of the United States. Typically officials of foreign manufacturers and importers are not United States residents.

(b) Occasionally an official of a foreign manufacturer also serves as an official of a domestic firm or corporation or is a permanent resident of the United States. In such cases, the official may serve as agent and sign the designation documents both on behalf of the foreign manufacturer and as agent. However, the foreign manufacturer must submit to NHTSA, along with the designation documents, a letter explaining that the individual signing the designation is both an official of the foreign manufacturer with authority to appoint an agent and a permanent resident of the United States or official of a domestic firm or corporation. If NHTSA does not receive an explanatory letter at the same time it receives the designation, the agency will deem the designation insufficient under this subpart and reject the submission.

§ 551.49 May a foreign manufacturer replace its agent?

(a) Yes, a foreign manufacturer may replace its agent in the same way it originally designated the agent. It must submit designation documents that meet the form and content requirements identified in the following section of this subpart. Until NHTSA receives designation documents meeting those requirements or a letter withdrawing an existing designation, the individual or domestic corporation
originally designated will continue to serve as its agent for service of process.

(b) A foreign manufacturer that has withdrawn but not replaced its agent may not continue to import motor vehicles or motor vehicle equipment into the United States. In order to do so, it must appoint a new agent in accordance with the requirements of this subpart.

§ 551.50 May more than one foreign manufacturer designate the same person as agent?

Yes, any number of foreign manufacturers separately may designate the same person as agent.

§ 551.51 May an agent assign performance of its functions to another individual or entity?

No, an agent may not assign performance of its functions.

§ 551.52 How long will a foreign manufacturer’s designation of agent remain in effect?

(a) A designation of agent remains in effect until replaced or withdrawn by a foreign manufacturer.

(b) A foreign manufacturer that has withdrawn but not replaced its agent may not continue to import motor vehicles or motor vehicle equipment into the United States. In order to do so, it must appoint a new agent in accordance with the requirements of this subpart.

FORM AND CONTENTS OF DESIGNATION

§ 551.53 What is the required format for a designation?

(a) All documents submitted under this subpart must be:
   (1) Original documents;
   (2) Written in English; and
   (3) Signed in ink.

(b) For each signature, the document must indicate in English:
   (1) The date of signature; and
   (2) The name and title of the individual who signed the document.

(c) As long as documents submitted by a foreign manufacturer and its agent contain all required information (identified in §§551.54, 551.55 and 551.56 below), there is no mandatory format for the designation.

(d) NHTSA encourages foreign manufacturers to use the suggested designation form set forth in the Appendix to this subpart. If completed and executed properly by both a foreign manufacturer and its agent, this form will comply fully with the requirements of §§551.53 through 551.65.

§ 551.54 What are the required contents for a designation?

The suggested designation form set forth in the Appendix, if completed and signed properly by a foreign manufacturer and its agent, contains all of the information necessary to create a valid designation under this subpart. Specifically, a valid designation must contain:

(a) A Designation by Foreign Manufacturer; and

(b) An Acceptance by Agent.

§ 551.55 What information must a Designation by Foreign Manufacturer contain?

A Designation by Foreign Manufacturer must contain:

(a) A statement that the designation is in valid form and binding on the foreign manufacturer under the laws, corporate bylaws or other requirements governing the making of designations at the place and time where it is made;

(b) The full legal name, principal place of business and mailing address of the foreign manufacturer;

(c) All trade or brand names, marks, logos or other designations of origin under which the foreign manufacturer’s products will be sold; and

(d) The signature in ink, and the name and title of the official or employee signing the designation on behalf of the foreign manufacturer, who must have authority to appoint an agent.

§ 551.56 What information must an Acceptance by Agent contain?

An Acceptance by Agent must contain:

(a) The full legal name, mailing address and telephone number of the agent;

(b) A statement that the agent accepts the designation and understands that (s)he may not assign performance
§ 551.57 Who may sign the Designation by Foreign Manufacturer?

Only an official or employee of the foreign manufacturer with authority to appoint an agent may sign the Designation by Foreign Manufacturer.

§ 551.58 Who may sign the Acceptance by Agent?

Only the agent, in the case of an individual, or an official or employee, in the case of a domestic firm or corporation serving as the agent with authority to sign for that firm of corporation, may sign the Acceptance of Agent.

§ 551.59 May the same individual sign both the Designation by Foreign Manufacturer and Acceptance by Agent?

(a) Generally no; the Designation by Manufacturer must be signed by an official or employee of the foreign manufacturer and the Acceptance by Agent must be signed by the foreign manufacturer’s agent, in the case of an individual, or by an official or employee, in the case of a domestic firm or corporation serving as its agent.

(b) Occasionally an official of a foreign manufacturer also serves as an official of a domestic firm or corporation or is a permanent resident of the United States. In such cases, the official may serve as agent and sign the designation documents both on behalf of the foreign manufacturer and as agent. However, the foreign manufacturer must submit to NHTSA, along with the designation documents, a letter explaining that the individual signing the designation is both an official of the foreign manufacturer with authority to appoint an agent and a permanent resident of the United States or official of a domestic firm or corporation. If NHTSA does not receive an explanatory letter at the same time it receives the designation, the agency will deem the designation insufficient under this subpart and reject the submission.

§ 551.60 When must the Designation by Foreign Manufacturer be signed?

(a) The foreign manufacturer must sign the Designation by Foreign Manufacturer on or before the date that the agent signs the Acceptance by Agent. It is not possible for an individual or entity to accept a designation as agent until on or after the date on which a foreign manufacturer makes the designation.

(b) If the Designation by Foreign Manufacturer is dated after the Acceptance by Agent, NHTSA will deem the designation insufficient under this subpart and reject the submission.

§ 551.61 When must the Acceptance by Agent be signed?

(a) The agent, in the case of an individual, or an employee or official, in the case of a domestic firm or corporation serving as agent, must sign the Acceptance by Agent on or after the date that the manufacturer signs the Designation by Foreign Manufacturer. It is not possible for an individual or entity to accept a designation as agent until on or after the date on which the foreign manufacturer makes the designation.

(b) If the Acceptance by Agent is dated before the Designation by Foreign Manufacturer, NHTSA will deem the designation insufficient under this subpart and reject the submission.

§ 551.62 Where should a foreign manufacturer mail the designation?

Foreign manufacturers must mail their designations to the Office of the Executive Secretariat, National Highway Traffic Safety Administration, Room 5221, 400 Seventh Street, SW, Washington, DC 20590. No other NHTSA office is authorized to accept designation documents. To avoid delays, the agency suggests using express mail services.
§ 551.63 May a foreign manufacturer submit a designation by email or facsimile?

No, the statute requires designation documents submitted by foreign manufacturers to contain original ink signatures. NHTSA will reject designation documents submitted via email or facsimile, as they do not satisfy this requirement.

§ 551.64 What if designation documents submitted by a foreign manufacturer do not comply with this subpart?

Designations of agent are binding on the foreign manufacturer even when their form and contents do not comply with this subpart, unless rejected by the agency.

§ 551.65 What if a foreign manufacturer changes its name, address or product names or marks?

(a) A foreign manufacturer must provide written notice to NHTSA of any changes in its name, address or marks, trade names, or other designations of origin appearing on its products.

(b) Foreign manufacturers should mail notices to the Office of the Executive Secretariat, National Highway Traffic Safety Administration, Room 5221, 400 Seventh Street, SW., Washington, DC 20590. To avoid delays, the agency suggests using express mail services.

METHOD OF SERVICE OF PROCESS

§ 551.66 What is the legal effect of service of process on an agent?

Service on an agent of administrative or judicial notices or process is deemed to be service on a manufacturer.

§ 551.67 Where and how may an agent be served?

An agent may be served at the agent’s office or usual place of residence, by registered or certified mail addressed to the agent with return receipt requested, or by any other manner authorized by law.

§ 551.68 What if an agent cannot be served?

If an agent cannot be served because the agent cannot be located, has ceased to exist or does not receive correctly addressed mail, service may be made by posting the notice or process in the Office of the Secretary of Transportation.
PART A: DESIGNATION BY FOREIGN MANUFACTURER

Pursuant to 49 U.S.C. § 30164 and 49 C.F.R. Part 551, Subpart D, the Foreign Manufacturer listed below hereby designates the following Agent on whom service of all administrative and judicial processes and notices may be made. This designation is for service of process only and for no other purpose. It shall remain in effect until it is withdrawn or another Agent is designated in accordance with the requirements of 49 U.S.C. § 30164 and 49 C.F.R. Part 551, Subpart D.

The Manufacturer identified below hereby certifies:

1. This designation is in valid form and binding on the Manufacturer under the laws, corporate bylaws or other requirements governing the making of designations at the place and time where it is made.

2. The full legal name, principal place of business and mailing address of the Manufacturer are:

3. The Manufacturer’s products will be sold under the following trade or brand names, marks, logos or other designations of origin (List all names, marks, logos or designations):

4. The full legal name, principal place of business, mailing address and telephone number of the Agent are:

By:

Signature of Manufacturer’s Authorized Representative

Month / Day / Year

Printed Name

Title

PART B: ACCEPTANCE BY AGENT

The undersigned hereby accepts appointment as Agent solely for the purpose of service of process on the Manufacturer under 49 U.S.C. § 30164 and 49 C.F.R. Part 551, Subpart D. I understand that this appointment shall remain in effect until withdrawn or replaced by the Manufacturer in accordance with the requirements of 49 U.S.C. § 30164 and 49 C.F.R. Part 551, Subpart D. I understand also that I may not assign performance of my functions under this Designation to another person.

TO AVOID DELAYS, LEAVE NO SPACES BLANK; DO NOT SEND VIA FACSIMILE OR EMAIL.

Mail original documents with ink signatures only to: Office of the Executive Secretariat, National Highway Traffic Safety Administration, Room 5221, 400 Seventh Street, SW, Washington, DC 20590
§ 552.5 Improperly filed petitions.

(a) A petition that is not addressed as specified in §552.4, but that meets the other requirements of that section, will be treated as a properly filed petition, received as of the time it is discovered and identified.

(b) A document that fails to conform to one or more of the requirements of §552.4(a) through (e) will not be treated as a petition under this part. Such a document will be treated according to the existing correspondence or other appropriate procedures of the NHTSA, and any suggestions contained in it
§ 552.6 Technical review.

The appropriate Associate Administrator conducts a technical review of the petition. The technical review may consist of an analysis of the material submitted, together with information already in the possession of the agency. It may also include the collection of additional information, or a public meeting in accordance with §552.7.

[60 FR 17267, Apr. 5, 1995]

§ 552.7 Public meeting.

If the Associate Administrator decides that a public meeting on the subject of the petition would contribute to the determination whether to commence a proceeding, he issues a notice of public meeting for publication in the FEDERAL REGISTER to advise interested persons of the time, place, and subject matter of the public meeting and invite their participation. Interested persons may submit their views and evidence through oral or written presentations, or both. There is no cross examination of witnesses. A transcript of the meeting is kept and exhibits may be accepted as part of the transcript. Sections 556 and 557 of title 5, U.S.C., do not apply to meetings held under this part. The Chief Counsel designates a member of his staff to serve as legal officer at the meeting.

§ 552.8 Notification of agency action on the petition.

After considering the technical review conducted under §552.6, and taking into account appropriate factors, which may include, among others, allocation of agency resources, agency priorities and the likelihood of success in litigation which might arise from the order, the Administrator will grant or deny the petition. NHTSA will notify the petitioner of the decision to grant or deny the petition within 120 days after its receipt of the petition.

[60 FR 17267, Apr. 5, 1995]

§ 552.9 Grant of petition.

(a) If a petition for rulemaking with respect to a motor vehicle safety standard is granted, a rulemaking proceeding is promptly commenced in accordance with applicable NHTSA and statutory procedures. The granting of such a petition and the commencement of a rulemaking proceeding does not signify, however, that the rule in question will be issued. A decision as to the issuance of the rule is made on the basis of all available information developed in the course of the rulemaking proceeding, in accordance with statutory criteria.

(b) If a petition with respect to a noncompliance or a defect is granted, a proceeding to determine the existence of the noncompliance or defect is promptly commenced by the initiation of an investigation by the Office of Standards Enforcement or the Office of Defects Investigation, as appropriate.

§ 552.10 Denial of petition.

If a petition is denied, a FEDERAL REGISTER notice of the denial is issued within 45 days of the denial, setting forth the reasons for denial of the petition.

SOURCE: 65 FR 30744, May 12, 2000, unless otherwise noted.

§ 552.11 Application.

This subpart establishes procedures for the submission and disposition of petitions filed by interested parties to initiate rulemaking to add a test procedure to 49 CFR 571.208, S28.

§ 552.12 Definitions.

For purposes of this subpart, the following definitions apply:

(a) Dynamic automatic suppression system (DASS) means a portion of an air bag system that automatically controls whether or not the air bag deploys during a crash by:

(1) Sensing the location of an occupant, moving or still, in relation to the air bag:
§ 552.14 Content of petition.

The petitioner shall provide the following information:

(a) A set of proposed test procedures for S28.1, S28.2, S28.3, and S28.4 of Standard No. 208 which the petitioner believes are appropriate for assessing a particular DASS.

1. For S28.1 of Standard No. 208, the petitioner shall specify at least one specific position for the Part 572 subpart O 5th percentile female dummy that is:
   (i) Outside but adjacent to the ASZ, and
   (ii) Representative of an unbelted occupant position that is likely to occur during a frontal crash.

2. For S28.2 of Standard No. 208, the petitioner shall specify at least one specific position for the Part 572 Subpart P 3-year-old child dummy and at least one specific position for the Part 572 Subpart N 6-year-old child dummy that are:
   (i) Outside but adjacent to the ASZ, and
   (ii) Representative of unbelted occupant positions that are likely to occur during a frontal crash where pre-crash braking occurs.

3. For S28.3 of Standard No. 208, the petitioner shall specify a procedure which tests the operation of the DASS by moving a test device toward the driver air bag in a manner that simulates the motion of an unbelted occupant during pre-crash braking or other pre-crash maneuver. The petitioner shall include in the procedure a means for determining whether the driver air bag was suppressed before any portion of the specified test device entered the ASZ during the test. The procedure shall also include a means of determining when the specified test device occupies the ASZ.

4. For S28.4 of Standard No. 208, the petitioner shall specify a procedure which tests the operation of the DASS by moving a test device toward the passenger air bag in a manner that simulates the motion of an unbelted occupant during pre-crash braking or...
§ 552.15 Processing of petition.

(a) NHTSA will process any petition that contains the information specified by this subpart. If a petition fails to provide any of the information, NHTSA will not process the petition but will advise the petitioner of the information that shall be provided if the agency is to process the petition. The agency will seek to notify the petitioner of what is likely to occur in real world crashes.

(b) For the procedures proposed for inclusion in S28.1 and S28.2 of Standard No. 208, the petitioner shall provide:

(i) A complete explanation of the means used in the proposed test to ascertain whether the air bag is suppressed or activated during the test.

(ii) A complete description of the means used to evaluate the ability of the DASS to detect and respond to an occupant moving toward an air bag, including the method used to move a test device toward an air bag at speeds representative of occupant movement during pre-crash braking or other pre-crash maneuver.

(iii) The procedure used for locating the test device inside a test vehicle in preparation for testing, including an accounting of the reference points used to specify such location.

(iv) An explanation of the methods used to measure the amount of time needed by a suppression system to suppress an air bag once a suppression triggering event occurs.

(v) High speed film or video of at least two tests of the DASS using the proposed test procedure.

(vi) Data generated from not less than two tests of the DASS using the proposed test procedure, including an account of the data streams monitored during testing and complete samples of these data streams from not less than two tests performed under the proposed procedure.

(d) Analysis concerning the variety of potential DASS designs for which the requested test procedure is appropriate; e.g., whether the test procedures are appropriate only for the specific DASS design contemplated by the petitioner, for all DASS designs incorporating the same technologies, or for all DASS designs.

§ 552.15 Processing of petition.

(a) NHTSA will process any petition that contains the information specified by this subpart. If a petition fails to provide any of the information, NHTSA will not process the petition but will advise the petitioner of what is likely to occur in real world crashes.

(b) For the procedures proposed for inclusion in S28.1 and S28.2 of Standard No. 208, the petitioner shall provide:

(i) A complete explanation of the means used in the proposed test to ascertain whether the air bag is suppressed or activated during the test.

(ii) A complete description of the means used to evaluate the ability of the DASS to detect and respond to an occupant moving toward an air bag, including the method used to move a test device toward an air bag at speeds representative of occupant movement during pre-crash braking or other pre-crash maneuver.

(iii) The procedure used for locating the test device inside a test vehicle in preparation for testing, including an accounting of the reference points used to specify such location.

(iv) An explanation of the methods used to measure the amount of time needed by a suppression system to suppress an air bag once a suppression triggering event occurs.

(v) High speed film or video of at least two tests of the DASS using the proposed test procedure.

(vi) Data generated from not less than two tests of the DASS using the proposed test procedure, including an account of the data streams monitored during testing and complete samples of these data streams from not less than two tests performed under the proposed procedure.

(d) Analysis concerning the variety of potential DASS designs for which the requested test procedure is appropriate; e.g., whether the test procedures are appropriate only for the specific DASS design contemplated by the petitioner, for all DASS designs incorporating the same technologies, or for all DASS designs.

APPENDIX A TO PART 553—STATEMENT OF POLICY: ACTION ON PETITIONS FOR RECONSIDERATION

APPENDIX B TO PART 553—STATEMENT OF POLICY: RULEMAKINGS INVOLVING THE ASSESSMENT OF THE FUNCTIONAL EQUIVALENCE OF SAFETY STANDARDS

APPENDIX C TO PART 553—STATEMENT OF POLICY: IMPLEMENTATION OF THE UNITED NATIONS/ECONOMIC COMMISSION FOR EUROPE (UN/ECE) 1998 AGREEMENT ON GLOBAL TECHNICAL REGULATIONS—AGENCY POLICY GOALS AND PUBLIC PARTICIPATION

SOURCE: 60 FR 62222, Dec. 5, 1995, unless otherwise noted.

Subpart A—General

§ 553.1 Applicability. This part prescribes rulemaking procedures that apply to the issuance, amendment, and revocation of rules pursuant to Title 49, Subtitle VI of the United States Code (49 U.S.C. 30101, et seq.).

§ 553.3 Definitions.

Administrator means the Administrator of the National Highway Traffic Safety Administration or a person to whom he has delegated final authority in the matter concerned.

Rule includes any order, regulation, or Federal motor vehicle safety standard issued under Title 49.

Title 49 means 49 U.S.C. 30101, et seq.

Subpart B—Procedures for Adoption of Rules

§ 553.11 Initiation of rulemaking.
§ 553.13 Notice of proposed rulemaking.
§ 553.15 Contents of notices of proposed rulemaking.
§ 553.17 Participation of interested persons.
§ 553.19 Petitions for extension of time to comment.
§ 553.7 Records.

Records of the National Highway Traffic Safety Administration relating to rulemaking proceedings are available for inspection as provided in section 552(b) of title 5 of the U.S.C. and Part 7 of the regulations of the Secretary of Transportation (Part 7 of this title).

Subpart B—Procedures for Adoption of Rules

§ 553.11 Initiation of rulemaking.

The Administrator may initiate rulemaking either on his own motion or on petition by any interested person after a determination in accordance with Part 552 of this title that grant of the petition is advisable. The Administrator may, in his discretion, also consider the recommendations of other agencies of the United States.

§ 553.13 Notice of proposed rulemaking.

Unless the Administrator, for good cause, finds that notice is impracticable, unnecessary, or contrary to the public interest, and incorporates that finding and a brief statement of the reasons for it in the rule, a notice of proposed rulemaking is issued and interested persons are invited to participate in the rulemaking proceedings under applicable provisions of Title 49.

§ 553.15 Contents of notices of proposed rulemaking.

(a) Each notice of proposed rulemaking is published in the Federal Register, unless all persons subject to it are named and are personally served with a copy of it.

(b) Each notice, whether published in the Federal Register or personally served, includes

1. A statement of the time, place, and nature of the proposed rulemaking proceeding;
2. A reference to the authority under which it is issued;
3. A description of the subjects and issues involved or the substance and terms of the proposed rule;
4. A statement of the time within which written comments must be submitted; and
5. A statement of how and to what extent interested persons may participate in the proceedings.

§ 553.17 Participation of interested persons.

(a) Any interested person may participate in rulemaking proceeding by submitting comments in writing containing information, views or arguments.

(b) In his discretion, the Administrator may invite any interested person to participate in the rulemaking procedures described in § 553.25.

§ 553.19 Petitions for extension of time to comment.

A petition for extension of the time to submit comments must be received not later than 15 days before expiration of the time stated in the notice. The petitions must be submitted to: Administrator, National Highway Traffic Safety Administration, U.S. Department of Transportation, 400 Seventh Street SW, Washington, DC, 20590. It is requested, but not required, that 10 copies be submitted. The filing of the petition does not automatically extend the time for petitioner’s comments. Such a petition is granted only if the petitioner shows good cause for the extension, and if the extension is consistent with the public interest. If an extension is granted, it is granted to all persons, and it is published in the Federal Register.

§ 553.21 Contents of written comments.

All written comments shall be in English. Unless otherwise specified in a
§ 553.23 Consideration of comments received.

All timely comments are considered before final action is taken on a rulemaking proposal. Late filed comments may be considered as far as practicable.

§ 553.25 Additional rulemaking proceedings.

The Administrator may initiate any further rulemaking proceedings that he finds necessary or desirable. For example, interested persons may be invited to make oral arguments, to participate in conferences between the Administrator or his representative and interested persons at which minutes of the conference are kept, to appear at informal hearings presided over by officials designated by the Administrator, at which a transcript or minutes are kept, or participate in any other proceeding to assure informed administrative action and to protect the public interest.

§ 553.27 Hearings.

(a) Sections 556 and 557 of title 5, United States Code, do not apply to hearings held under this part. Unless otherwise specified, hearings held under this part are informal, non-adversary, fact-finding proceedings, at which there are no formal pleadings or adverse parties. Any rule issued in a case in which an informal hearing is held is not necessarily based exclusively on the record of the hearing.

(b) The Administrator designates a representative to conduct any hearing held under this part. The Chief Counsel designates a member of his staff to serve as legal officer at the hearing.

§ 553.29 Adoption of final rules.

Final rules are prepared by representatives of the office concerned and the Office of the Chief Counsel. The rule is then submitted to the Administrator for its consideration. If the Administrator adopts the rule, it is published in the Federal Register, unless all persons subject to it are named and are personally served with a copy of it.

§§ 553.31–553.33 [Reserved]

§ 553.35 Petitions for reconsideration.

(a) Any interested person may petition the Administrator for reconsideration of any rule issued under this part. The petition shall be submitted to: Administrator, National Highway Traffic Safety Administration, 400 Seventh Street, SW, Washington, DC, 20590. It is requested, but not required, that 10 copies be submitted. The petition must be received not later than 45 days after publication of the rule in the Federal Register. Petitions filed after that time will be considered as petitions filed under Part 552 of this chapter. The petition must contain a brief statement of the complaint and an explanation as to why compliance with the rule is not practicable, is unreasonable, or is not in the public interest. Unless otherwise specified in the final rule, the statement and explanation together may not exceed 15 pages in length, but necessary attachments may be appended to the submission without regard to the 15-page limit.

(b) If the petitioner requests the consideration of additional facts, he must state the reason they were not presented to the Administrator within the prescribed time.

(c) The Administrator does not consider repetitious petitions.

(d) Unless the Administrator otherwise provides, the filing of a petition under this section does not stay the effectiveness of the rule.

§ 553.37 Proceedings on petitions for reconsideration.

The Administrator may grant or deny, in whole or in part, any petition.
§ 553.39 Effect of petition for reconsideration on time for seeking judicial review.

The filing of a timely petition for reconsideration of any rule issued under this part postpones the expiration of the statutory period in which to seek judicial review of that rule only as to the petitioner, and not as to other interested persons. For the petitioner, the period for seeking judicial review will commence at the time the agency takes final action upon the petition for reconsideration.

(60 FR 63651, Dec. 12, 1995)

APPENDIX A TO PART 553—STATEMENT OF POLICY: ACTION ON PETITIONS FOR RECONSIDERATION

It is the policy of the National Highway Traffic Safety Administration to issue notice of the action taken on a petition for reconsideration within 90 days after the closing date for receipt of such petitions, unless it is found impracticable to take action within that time. In cases where it is so found and the delay beyond that period is expected to be substantial, notice of that fact, and the date by which it is expected that action will be taken, will be published in the Federal Register.

APPENDIX B TO PART 553—STATEMENT OF POLICY: RULEMAKINGS INVOLVING THE ASSESSMENT OF THE FUNCTIONAL EQUIVALENCE OF SAFETY STANDARDS

(a) Based on a comparison of the performance of vehicles or equipment, the National Highway Traffic Safety Administration (NHTSA) may tentatively determine that a foreign motor vehicle safety standard is better than or at least functionally equivalent to a Federal Motor Vehicle Safety Standard (FMVSS), either on its own motion or in connection with a petition for rulemaking by any interested party under 49 CFR Part 552. Such determinations will be made in accordance with the process described in the flowchart in Figure 1 of this Appendix.

(b) Under the process, if NHTSA decides that there is reason to believe that a foreign standard is better than or at least functionally equivalent to a FMVSS in accordance with the process, it will commence a rulemaking proceeding that may lead to the issuance of a proposal to add the foreign standard as an alternative compliance option to the FMVSS, to harmonize the FMVSS with the foreign standard or to upgrade the FMVSS to the level of the foreign standard, as appropriate. Such a proposal will request comment on the agency’s tentative determination regarding relative benefits and functional equivalence as well as the proposed amendment. Final determinations regarding these matters will also be made in accordance with the analytical criteria in the flowchart.

(c) As used in this appendix, the term “standard” refers to mandatory requirements and thus has the same meaning given the term “technical regulation” in Annex 1 to the World Trade Organization Technical Barriers to Trade Agreement.
EXPLANATION OF FLOWCHART

A. Ultimate Goal

The ultimate goal in comparing standards is to assess the real world safety performance of the covered vehicles or equipment. Particularly in the case of crashworthiness standards, the most reliable basis for making that assessment is fatality and injury data directly drawn from actual crashes. Accordingly, NHTSA will make appropriate efforts to ensure the availability of such data regarding crashes in the U.S.

B. Guiding Principles

Best Practices

NHTSA pursues a ‘‘best practices’’ policy in comparing U.S. and foreign safety standards, i.e., NHTSA will propose to upgrade its standards if it tentatively concludes that a Country B standard offers greater benefits than the counterpart FMVSS, and if upgrading appears appropriate, considering the incremental costs and benefits and applicable statutory criteria. (For a discussion of another type of rulemaking proposal that may be considered in these circumstances, see the paragraph below on comparisons that indicate that a foreign standard’s safety benefits are greater than those of the counterpart FMVSS.)

Conservatism

1. NHTSA places priority on preserving the safety benefits of the FMVSSs.

2. NHTSA can best preserve those benefits by being conservative in reaching any conclusion that a Country B standard is better than or at least functionally equivalent to the counterpart FMVSS. One reason for conservatism is that differences from vehicle model to vehicle model and manufacturer to manufacturer in margins of compliance may confound efforts to assess the relative benefits of two standards. Further, there may be circumstantial differences, such as special environmental conditions, driver demographics, driver behavior, occupant behavior (e.g., level of safety belt use), road conditions, size distribution of vehicle fleet (e.g., proportion of big versus small vehicles and disparity between extremes), that could influence real world safety benefits. These differences may result in a particular standard having a safety record in a foreign country that would not necessarily be repeated in the United States.

Best Available Evidence

1. NHTSA will base its comparison of standards on the best available evidence. If available, estimates of real world safety benefits based on fatality and injury data directly drawn from actual crashes are the best evidence. If such data are not available, then estimates based on other information, such as compliance test data, may be used, although increased caution needs to be exercised in making judgment based on those estimates. If sufficient crash data regarding real world safety benefits are available, and a comparison of those benefits shows that the Country B standard is less beneficial than the counterpart Federal Motor Vehicle Safety Standard (FMVSS), NHTSA would avoid wasting resources making comparisons on the basis of less probative types of evidence.

2. The types of benefits examined in comparing two standards might differ depending on whether the standards are crash avoidance standards or crashworthiness standards. Translating differences in performance (an input measure) into numbers of crashes or numbers of deaths and injuries (output measures) is more difficult in the case of crash avoidance standards. As a result, while the relative benefits of two crashworthiness standards would typically be assessed in terms of their impacts on deaths and injuries in crashes, the relative merits of two different crash avoidance standards might well be assessed in terms of their impact on vehicle or equipment performance.

Sufficiency of Evidence

1. Many types of data are available for a comparison of two standards. Often there is an abundance of one type of data and little or no data from other sources. If insufficient data are available, and such data either cannot be generated through engineering analyses (e.g., real world safety benefits estimates), or conducting additional research and development is not cost-effective, then NHTSA will stop consideration of such data and consider the other available data instead.

2. The essentially horizontal, left-to-right path through the flowchart is intended to illustrate the sources of data that will be considered and provide a rough idea of the priority they will receive. Each step branches independently to the tentative determination of relative benefits and functional equivalency by its ‘‘yes’’ path. This may seem to preclude later steps once any ‘‘yes’’ path is encountered. In practice, however, all data sources will be considered to the extent that they are available before a final determination regarding these matters is made.

Reciprocity

1. NHTSA will take steps to encourage reciprocity by other countries in the making of functional equivalence determinations.

2. When NHTSA’s comparison of standards indicates that one of the FMVSSs has benefits equal to or greater than the counterpart Country B standard, NHTSA may forward the results of that comparison to Country B
and request that consideration be given by
Country B to determining that the FMVSS
is better than or at least functionally equiva-
 lent to the counterpart Country B standard,
and to subsequently amending its standard
accordingly.

C. Agency Decisions in Which Flowchart Is Used

This flowchart guides agency decisions in
connection with a rulemaking proceeding
that involves the issue of relative benefits
and functional equivalence.

1. Decision whether to grant a rulemaking pe-
tition. If the agency receives a petition for
rulemaking based on a claim that one of
Country B’s standards is better than or at
least functionally equivalent to one of the
Federal Motor Vehicle Safety Standards
(FMVSSs), the agency will consider the mer-
its of the petition in accordance with 49 CFR
Part 553. Petitions for rulemaking, defect,
and noncompliance orders, and with the
functional equivalence process set forth in
the flowchart. If it appears that there is rea-
son to believe that Country B’s standard pro-
vides safety benefits are greater than or at
least equal to those of the FMVSS, the agen-
cy will likely grant the petition and com-
mence a rulemaking proceeding.

The agency emphasizes that its priority
with respect to international harmonization
is identifying and adopting those foreign
safety standards that represent best prac-
tices. Accordingly, if resource limitations
make it necessary to choose between com-
peting petitions in granting or processing
them, the agency would give priority to peti-
tions asking the agency to upgrade one of its
standards to the level of a superior foreign
standard over petitions simply asking the
agency to add a compliance alternative.

2. Decision whether to issue a notice of pro-
posed rulemaking. If NHTSA grants the peti-
tion, it will proceed, as in any other rule-
making regarding the FMVSSs, to determine
whether amending an FMVSS would be ap-
propriate under the applicable statutory cri-
teria in chapter 301 of title 49, U.S.C. Fol-
lowing the process set forth in the flowchart,
the agency will use data submitted by the peti-
tioner, supplemented by data from other
sources, to compare performance and ten-
vatively determine whether Country B’s
standard specified in the petition is better
than or at least functionally equivalent to
the FMVSS specified in the petition.

This comparison could have a variety of
possible outcomes:

a. The comparison may indicate that the for-
eign standard’s safety benefits are less than
those of the counterpart FMVSS. If NHTSA
determines that the foreign standard results in
fewer safety benefits than the counterpart
FMVSS, it will terminate the rulemaking
proceeding.

b. The comparison may indicate that the for-
eign standard’s safety benefits are approxi-
ately equal to those of the counterpart
FMVSS. If the agency tentatively determines
that the safety benefits of a foreign standard
are approximately equal to those of a
FMVSS, it will take one of two steps in most
instances. One possibility is that it will de-
velop a notice of proposed rulemaking
(NPRM) proposing to amend the FMVSS by
adding the foreign standard as an alternative
to the existing requirements of the FMVSS.
The other possibility is that the agency will
develop an NPRM proposing to harmonize
the FMVSS with the foreign standard. This
second approach would enable NHTSA to
maintain a single set of requirements and
test procedures in its standard, thereby
minimizing any drain on its enforcement re-
sources. An additional possibility that might
be considered in some instances would be
“qualified functional equivalence.” Under
this third approach, the agency would regard
Country B’s standard to be functionally
equivalent if it is supplemented by a speci-
fied requirement in the counterpart FMVSS.

c. The comparison may indicate that the for-
eign standard’s safety benefits are greater than
those of the counterpart FMVSS. If NHTSA
tentatively determines that the foreign
standard results in greater safety benefits
than the counterpart FMVSS, and if upgrad-
ing is appropriate, based on the incremental
benefits and costs and applicable statutory
criteria, the agency issues an NPRM pro-
posing to upgrade the FMVSS to the level of
Country B’s std. If upgrading is not appro-
priate, NHTSA considers issuing an NPRM
proposing to add the requirements of Coun-
try B’s std to the FMVSS as an alternative
compliance option. The proposal to add the
compliance option would set forth the basis
for the agency’s conclusion that upgrading
the FMVSS is inappropriate.

If NHTSA issues an NPRM, it would request
comment on the tentative determination and
the proposed amendment.

3. Decision whether to issue a final rule. Any
final decision to make a determination re-
garding relative benefits and functional
equivalency and to amend the FMVSS will
be made in accordance with the process in
the flowchart and applicable law and only
after careful consideration and analysis of
the public comments.

[63 FR 26514, May 13, 1998]
APPENDIX C TO PART 553—STATEMENT OF POLICY: IMPLEMENTATION OF THE UNITED NATIONS/ECONOMIC COMMISSION FOR EUROPE (UN/ECE) 1998 AGREEMENT ON GLOBAL TECHNICAL REGULATIONS—AGENCY POLICY GOALS AND PUBLIC PARTICIPATION

I. AGENCY POLICY GOALS FOR THE 1998 GLOBAL AGREEMENT AND INTERNATIONAL MOTOR VEHICLE SAFETY HARMONIZATION

A. Paramount Policy Goal Under the 1998 Global Agreement

Continuously improve safety and seek high levels of safety, particularly by developing and adopting new global technical regulations reflecting consideration of current and anticipated technology and safety problems.

B. Other Policy Goals

1. Adopt and maintain U.S. standards that fully meet the need in the U.S. for vehicle safety.
2. Harmonize U.S. standards with those of other countries or regions, particularly by raising U.S. standards at least to the level of the best practices in those other safety standards.
3. Enhance regulatory effectiveness through regulatory cooperation with other countries and regions, thereby providing greater safety protection with available government resources.

II. PUBLIC PARTICIPATION AND THE ESTABLISHING OF GLOBAL TECHNICAL REGULATIONS FOR MOTOR VEHICLE SAFETY, THEFT, AND ENERGY EFFICIENCY

A. Summary of the Process Under the 1998 Global Agreement for Establishing Global Technical Regulations

1. Proposal Stage

A Contracting Party submits a proposal for either a harmonized or new global technical regulation to the Executive Committee of the 1998 Global Agreement (i.e., the Contracting Parties to the Agreement). If appropriate, the Committee then refers the proposal to a working party of experts to develop the technical elements of the regulation.

2. Recommendation Stage

When a working party of experts recommends a harmonized or new global technical regulation, it sends a report and the recommended regulation to the Executive Committee. The Committee then determines whether the recommendations are adequate and considers the establishment of the recommended regulation.

3. Establishment Stage

If the Executive Committee reaches consensus in favor of that recommended global technical regulation, the global technical regulation is established in the Global Registry.

B. Notice of Annual Work Program of WP.29

Each year, NHTSA will publish a notice concerning the motor vehicle safety, theft, and energy efficiency aspects of the annual program of work for the UN/ECE’s World Forum for Harmonization of Vehicle Regulations (WP.29). Each notice will include:

1. A calendar of scheduled meetings of WP.29 participants and working parties of experts, and meetings of the Executive Committee; and
2. A list of the global technical regulations that:
   a. Have been proposed and referred to a working party of experts, or
   b. Have been recommended by a working party of experts.

Periodically, the notice will also include a request for public comments on the subjects for which global technical regulations should be established under the 1998 Global Agreement. The agency will publish a subsequent notice identifying the priorities on which NHTSA will focus in the future under the 1998 Global Agreement.

C. Public Meetings

NHTSA will hold periodic public meetings on its activities under the 1998 Global Agreement. If the extent of recent and anticipated significant developments concerning those activities so warrant, NHTSA will hold a public meeting within the 60-day period before each of the three sessions of WP.29 held annually. At each of these public meetings, NHTSA will:

1. Brief the public on the significant developments that occurred at the session of WP.29, the meetings of the working parties of experts and the meetings of the Executive Committee since the previous public meeting;
2. Based on the availability of provisional agendas, inform the public about the significant issues to be addressed at upcoming session of WP.29 and meetings of the working parties of experts and any votes scheduled at the next session of the Executive Committee on recommended global technical regulations; and
3. Invite public comment and questions concerning those past developments and upcoming issues and votes and the general positions that the U.S. could take regarding those votes, and concerning any other significant developments and upcoming matters relating to pending proposed or recommended global technical regulations.
Appropriate agency officials will participate in the public meetings. These public meetings may be held separately from or in conjunction with the agency’s quarterly meetings on its vehicle rulemaking and research and development programs. The agency may hold additional public meetings.

D. Notices Concerning Individual Global Technical Regulations

1. Notice Requesting Written Comment on Proposed Global Technical Regulations
   a. Proposals by the U.S. (See Figure 1.)
      Before submitting a draft U.S. proposal for a global technical regulation to WP.29, NHTSA will publish a notice requesting public comments on the draft proposed global technical regulation. In the case of a draft proposal for a harmonized global technical regulation, the notice will compare that regulation with any existing, comparable U.S. standard, including the relative impacts of the regulation and standard. In the case of a draft proposal for a new global technical regulation, the notice will generally discuss the problem addressed by the proposal, the rationale for the proposed approach for addressing the problem, and the impacts of the proposal. NHTSA will consider the public comments and, as it deems appropriate, revise the proposal and any of its supporting documentation and then submit the proposal to WP.29.
   b. Proposals by a Contracting Party other than the U.S. (See Figure 2.)
      After a proposal by a Contracting Party other than the U.S. has been referred to a working party of experts and has been made available in English by WP.29, NHTSA will make the draft proposal available in the DOT docket (http://dms.dot.gov). The agency will then publish a notice requesting public comment on the draft proposal and will consider the comments in developing a U.S. position on the proposal.

2. Notice Requesting Written Comment on Recommended Global Technical Regulations
   If a working party of experts recommends a global technical regulation and sends a report and the recommended regulation to the Executive Committee, NHTSA will make an English language version of the report and the regulation available in the DOT docket (http://dms.dot.gov) after they are made available by WP.29. The agency will publish a notice requesting public comment on the report and regulation. Before participating in a vote of the Executive Committee regarding the establishment of the regulation, the agency will consider the comments and develop a U.S. position on the recommended technical regulation.

3. Notice Requesting Written Comment on Established Global Technical Regulations
   If a global technical regulation is established in the Global Registry by a consensus vote of the Executive Committee, and if the U.S. voted for establishment, NHTSA will publish a notice requesting public comment on adopting the regulation as a U.S. standard. Any decision by NHTSA whether to issue a final rule adopting the regulation or to issue a notice terminating consideration of that regulation will be made in accordance with applicable U.S. law and only after careful consideration and analysis of public comments.

E. Availability of Documents
   As we obtain English versions of key documents relating to motor vehicle safety, theft or energy conservation that are generated under the 1998 Agreement (e.g., proposals referred to a working party of experts, and reports and recommendations issued by a working party), we will place them in the internet-accessible DOT docket (http://dms.dot.gov). Within the limits of available resources, we will also place the documents on an international activities page that will be included in our Website (http://www.nhtsa.dot.gov/cars/rules/international/index.html).

PART 554—STANDARDS ENFORCEMENT AND DEFECTS INVESTIGATION

Sec. 554.1 Scope.
554.2 Purpose.
554.3 Application.
554.4 Office of Vehicle Safety Compliance.
554.5 Office of Defects Investigation.
554.6 Opening an investigation.
554.7 Investigation priorities.
554.8 Monthly reports.
554.9 Availability of files.
554.10 Initial determinations and public meetings.
554.11 Final decisions.

SOURCE: 45 FR 10797, Feb. 19, 1980, unless otherwise noted.

§ 554.1 Scope.
This part establishes procedures for enforcing Federal motor vehicle safety standards and associated regulations, investigating possible safety-related defects, and making non-compliance and defect determinations.

§ 554.2 Purpose.
The purpose of this part is to inform interested persons of the procedures followed by the National Highway Traffic Safety Administration in order more fairly and effectively to implement 49 U.S.C. Chapter 301.

[60 FR 17267, Apr. 5, 1995]

§ 554.3 Application.
This part applies to actions, investigations, and defect and noncompliance decisions of the National Highway traffic Safety Administration under 49 U.S.C. 30116, 30117, 30118, 30120 and 30165.

[60 FR 17267, Apr. 5, 1995]

§ 554.4 Office of Vehicle Safety Compliance.
The Office of Vehicle Safety Compliance, investigates compliance with Federal motor vehicle safety standards and associated regulations, and to this end may:
(a) Verify that manufacturers certify compliance with all applicable safety standards;
(b) Collect field reports from all sources;
(c) Collect manufacturers’ certification test data and other supporting evidence, including dealer communications;
(d) Inspect vehicles and equipment already in use or new vehicles and equipment at any stage of the manufacturing, distribution and sales chain;
(e) Conduct selective compliance tests; and
(f) Utilize other means necessary to conduct investigations.

§ 554.5 Office of Defects Investigation.
The Office of Defects Investigation conducts investigations to implement the provisions of the Act concerning the identification and correction of safety-related defects in motor vehicles and motor vehicle equipment. It elicits from every available source and evaluates on a continuing basis any information suggesting the existence of a safety-related defect.

§ 554.6 Opening an investigation.
(a) A compliance or defect investigation is opened either on the motion of the Administrator or his delegate or on the granting of a petition of an interested party under part 552 of this chapter.
(b) A manufacturer is notified immediately by telephone of any compliance test failure in order to enable the manufacturer to begin his own investigation. Notification is sent by mail at the beginning of any defect or noncompliance investigation.

§ 554.7 Investigation priorities.
(a) Compliance investigation priorities are reviewed annually and are set according to the following criteria:
(1) Prior compliance test data;
(2) Accident data;
(3) Engineering analysis of vehicle and equipment designs;
(4) Consumer complaints; and
(5) Market share.
(b) Defects inputs are reviewed periodically by an appropriate panel of engineers in consultation with the Office of Chief Counsel to determine whether a formal investigation should be opened by the Office of Defects Investigation.
§ 554.8 Monthly reports.

(a) Compliance. A monthly compliance report is issued which lists investigations opened, closed, and pending during that month, identifies compliance test reports accepted, and indicates how individual reports may be obtained.

(b) Defects. A monthly defects report is issued which lists investigations opened, closed, pending, and suspended during that month. An investigation may be designated “suspended” where the information available is insufficient to warrant further investigation. Suspended cases are automatically closed 60 days after appearing in a monthly report unless new information is received which justifies a different disposition.

§ 554.9 Availability of files.

All files of closed or suspended investigations are available for public inspection in the NHTSA Technical Reference Library. Communications between the agency and a manufacturer with respect to ongoing investigations are also available. Such files and communications may contain material which is considered confidential but has been determined to be necessary to the subject proceeding. Material which is considered confidential but has not been determined to be necessary to the subject proceeding will not be disclosed. Reproduction of entire public files or of individual documents can be arranged.

§ 554.10 Initial determinations and public meetings.

(a) An initial decision of failure to comply with safety standards or of a safety-related defect is made by the Administrator or his delegate based on the completed investigative file compiled by the appropriate office.

(b) The decision is communicated to the manufacturer in a letter which makes available all information on which the decision is based. The letter advises the manufacturer of his right to present information, views, and arguments to establish that there is no defect or failure to comply or that the alleged defect does not affect motor vehicle safety. The letter also specifies the time and place of a public meeting for the presentation of arguments or sets a date by which written comments must be submitted. Submission of all information, whether at a public meeting or in written form, is normally scheduled about 30 days after the initial decision. The deadline for submission of information can be extended for good cause shown.

(c) Public notice of an initial decision is made in a Federal Register notice that—

(1) Identifies the motor vehicle or item of equipment and its manufacturer;

(2) Summarizes the information on which the decision is based.

(3) Gives the location of all information available for public examination; and

(4) States the time and place of a public meeting or the deadline for written submission in which the manufacturer and interested persons may present information, views, and arguments respecting the decision.

(d) A transcript of the public meeting is kept and exhibits may be offered. There is no cross-examination of witnesses.

[45 FR 10797, Feb. 19, 1980, as amended at 60 FR 17267, Apr. 5, 1995]

§ 554.11 Final decisions.

(a) The Administrator bases his final decision on the completed investigative file and on information, views, and arguments submitted at the public meeting.

(b) If the Administrator decides that a failure to comply or a safety-related defect exists, he orders the manufacturer to furnish the notification specified in 49 U.S.C. 30118 and 30119 and to remedy the defect or failure to comply.

(c) If the Administrator closes an investigation following an initial determination, without making a final determination that a failure to comply or a safety-related defect exists, he or she will so notify the manufacturer and publish a notice of that closing in the Federal Register.

(d) A statement of the Administrator’s final decision and the reasons for it appears in each completed public file.

[60 FR 17268, Apr. 5, 1995]
PART 555—TEMPORARY EXEMPTION FROM MOTOR VEHICLE SAFETY AND BUMPER STANDARDS

Subpart A—General

Sec. 555.1 Scope.  
This part establishes requirements for the temporary exemption by the National Highway Traffic Safety Administration (NHTSA) of certain motor vehicles from compliance with one or more Federal motor vehicle safety standards in accordance with 49 U.S.C. 30113, and of certain passenger motor vehicles from compliance with all or part of a Federal bumper standard in accordance with 49 U.S.C. 32502.

[64 FR 2861, Jan. 19, 1999]

§ 555.2 Purpose.  
(a) The purpose of this part is to provide a means by which manufacturers of motor vehicles may obtain temporary exemptions from Federal motor vehicle safety standards on the basis of substantial economic hardship, facilitation of the development of new motor vehicle safety or low-emission engine features, or existence of an equivalent overall level of motor vehicle safety.

(b) The purpose of this part is also to provide a means by which manufacturers of passenger motor vehicles may obtain a temporary exemption from compliance with all or part of a Federal bumper standard issued under part 581 of this chapter on a basis similar to that provided for exemptions from the Federal motor vehicle safety standards.

[38 FR 2694, Jan. 29, 1973, as amended at 64 FR 2861, Jan. 19, 1999]

§ 555.3 Application.  
This part applies to manufacturers of motor vehicles and passenger motor vehicles.

[64 FR 2861, Jan. 19, 1999]

§ 555.4 Definitions.  
Administrator means the National Highway Traffic Safety Administrator or his delegate.

Passenger motor vehicle means a motor vehicle with motive power designed to carry not more than 12 individuals, but does not include a truck not designed primarily to carry its operator or passengers, or a motorcycle.

United States means the several States, the District of Columbia, the Commonwealth of Puerto Rico, Guam, the Virgin Islands, the Canal Zone, and American Samoa.

[38 FR 2694, Jan. 29, 1973, as amended at 64 FR 2861, Jan. 19, 1999]

§ 555.5 Application for exemption.  
(a) A manufacturer of motor vehicles or passenger motor vehicles may apply to NHTSA for a temporary exemption from any Federal motor vehicle safety or bumper standard or for a renewal of any exemption on the bases of substantial economic hardship, making easier the development or field evaluation of new motor vehicle safety or impact protection, or low-emission vehicle features, or that compliance with a standard would prevent it from selling a vehicle with an overall level of safety or impact protection at least equal to that of nonexempted vehicles.
(b) Each application filed under this part for an exemption or its renewal must—
(1) Be written in the English language;
(2) Be submitted in three copies to: Administrator, National Highway Traffic Safety Administration, Washington, DC 20590;
(3) State the full name and address of the applicant, the nature of its organization (individual, partnership, corporation, etc.) and the name of the State or country under the laws of which it is organized;
(4) State the number and title, and the text or substance of the standard or portion thereof from which the temporary exemption is sought, and the length of time desired for such exemption;
(5) Set forth the basis for the application and the information required by §555.6(a), (b), (c), or (d) as appropriate.
(6) Specify any part of the information and data submitted which petitioner requests be withheld from public disclosure in accordance with part 512 of this chapter.
(i) The information and data which petitioner requests be withheld from public disclosure must be submitted in accordance with §512.4 of this chapter.
(ii) The petitioner’s request for withholding from public disclosure must be accompanied by a certification in support as set forth in appendix A to part 512 of this chapter.
(7) Set forth the reasons why the granting of the exemption would be in the public interest, and, as applicable, consistent with the objectives of 49 U.S.C. Chapter 301 or Chapter 325.
(c) The knowing and willful submission of false, fictitious or fraudulent information will subject the petitioner to the civil and criminal penalties of 18 U.S.C. 1001.

§ 555.6 Basis for application.

(a) If the basis of the application is that compliance with the standard would cause substantial economic hardship to a manufacturer that has tried to comply with the standard in good faith, the applicant shall provide the following information:
(1) Engineering and financial information demonstrating in detail how compliance or failure to obtain an exemption would cause substantial economic hardship, including—
(i) A list or description of each item of motor vehicle equipment that would have to be modified in order to achieve compliance;
(ii) The itemized estimated cost to modify each such item of motor vehicle equipment if compliance were to be achieved—
(A) As soon as possible,
(B) At the end of a 1-year exemption period (if the petition is for 1 year or more),
(C) At the end of a 2-year exemption period (if the petition is for 2 years or more),
(D) At the end of a 3-year exemption period (if the petition is for 3 years),
(iii) The estimated price increase per vehicle to balance the total costs incurred pursuant to paragraph (a)(1)(ii) of this section and a statement of the anticipated effect of each such price increase;
(iv) Corporate balance sheets and income statements for the three fiscal years immediately preceding the filing of the application;
(v) Projected balance sheet and income statement for the fiscal year following a denial of the application; and
(vi) A discussion of any other hardships (e.g., loss of market, difficulty of obtaining goods and services for compliance) that the petitioner desires the NHTSA to consider in deciding whether the petitioner

tried in good faith to comply with the standard;
(iv) A description of the steps to be taken, while the exemption is in effect, and the estimated date by which full compliance will be achieved either by design changes or termination of production of nonconforming vehicles; and
(v) The total number of motor vehicles produced by or on behalf of the petitioner in the 12-month period prior to filing the petition, and the inclusive dates of the period. (49 U.S.C. 30113(d) limits eligibility for exemption on the basis of economic hardship to manufacturers whose total motor vehicle production in the year preceding the filing of their applications does not exceed 10,000.)
(b) If the basis of the application is that the exemption would make easier the development or field evaluation of a new motor vehicle safety or impact protection features providing a safety or impact protection level at least equal to that of the standard, the applicant shall provide the following information:
(1) A description of the safety or impact protection features, and research, development, and testing documentation establishing the innovational nature of such features.
(2) An analysis establishing that the level of safety or impact protection of the feature is equivalent to or exceeds the level of safety or impact protection established in the standard from which exemption is sought, including—
(i) A detailed description of how a vehicle equipped with the safety or impact protection feature differs from one that complies with the standard;
(ii) If applicant is presently manufacturing a vehicle conforming to the standard, the results of tests conducted to substantiate certification to the standard; and
(iii) The results of tests conducted on the safety or impact protection features that demonstrates performance which meets or exceeds the requirements of the standard.
(3) Substantiation that a temporary exemption would facilitate the development or field evaluation of the vehicle.
(4) A statement whether, at the end of the exemption period, the manufacturer intends to conform to the standard, apply for a further exemption, or petition for rulemaking to amend the standard to incorporate the safety or impact protection features.
(5) A statement that not more than 2,500 exempted vehicles will be sold in the United States in any 12-month period for which an exemption may be granted pursuant to this paragraph. An application for renewal of such an exemption shall also include the total number of exempted vehicles sold in the United States under the existing exemption.
(c) If the basis of the application is that the exemption would make the development or field evaluation of a low-emission vehicle easier and would not unreasonably lower the safety or impact protection level of that vehicle, the applicant shall provide—
(1) Substantiation that the vehicle is a low-emission vehicle as defined by 49 U.S.C. 30113(a).
(2) Research, development, and testing documentation establishing that a temporary exemption would not unreasonably degrade the safety or impact protection of the vehicle, including—
(i) A detailed description of how the motor vehicle equipped with the low-emission engine would, if exempted, differ from one that complies with the standard;
(ii) If the applicant is presently manufacturing a vehicle conforming to the standard, the results of tests conducted to substantiate certification to the standard;
(iii) The results of any tests conducted on the vehicle that demonstrate its failure to meet the standard, expressed as comparative performance levels; and
(iv) Reasons why the failure to meet the standard does not unreasonably degrade the safety or impact protection of the vehicle.
(3) Substantiation that a temporary exemption would facilitate the development or field evaluation of the vehicle.
(4) A statement whether, at the end of the exemption period, the manufacturer intends to conform with the standard.
(5) A statement that not more than 2,500 exempted vehicles will be sold in
§ 555.7 Processing of applications.

(a) The NHTSA publishes in the Federal Register, affording opportunity for comment, a notice of each application containing the information required by this part. However, if the NHTSA finds that an application does not contain the information required by this part, it so informs the applicant, pointing out the areas of insufficiency and stating that the application will not receive further consideration until the required information is submitted.

(b) No public hearing, argument, or other formal proceeding is held directly on an application filed under this part before its disposition under this section.

(c) Any interested person may, upon written request, appear informally before an appropriate official of the NHTSA to discuss an application for exemption or the action taken in response to a petition.

(d) If the Administrator determines that the application does not contain adequate justification, he denies it and notifies the petitioner in writing. He also publishes in the Federal Register a notice of the denial and the reasons for it.

(e) If the Administrator determines that the application contains adequate justification, he grants it, and notifies the petitioner in writing. He also publishes in the Federal Register a notice of the grant and the reasons for it.

(f) Unless a later effective date is specified in the notice of the grant, a temporary exemption is effective upon publication of the notice in the Federal Register and exempts vehicles manufactured on and after the effective date.

§ 555.8 Termination of temporary exemptions.

(a) A temporary exemption from a standard granted on the basis of substantial economic hardship terminates according to its terms but not later than 3 years after the date of issuance unless terminated sooner pursuant to paragraph (d) of this section.

(b) A temporary exemption from a standard granted on a basis other than substantial economic hardship terminates according to its terms but not later than 2 years after the date of issuance unless terminated sooner pursuant to paragraph (d) of this section.

(c) Any interested person may petition for the termination or modification of an exemption granted under this part. The petition will be processed in accordance with the procedures of part 552 of this chapter.

(d) The Administrator terminates or modifies a temporary exemption if he determines that—

(1) The temporary exemption is no longer consistent with the public interest and the objectives of the Act; or

(2) The temporary exemption was granted on the basis of false, fraudulent, or misleading representations or information.

(e) If an application for renewal of a temporary exemption that meets the requirements of §555.5 has been filed not later than 60 days before the termination date of an exemption, the exemption does not terminate until the Administrator grants or denies the application for renewal.

(f) The Administrator publishes in the FEDERAL REGISTER a notice of:

(1) An application for termination or modification of an exemption and the action taken in response to it; and

(2) Any termination or modification of an exemption pursuant to the Administrator’s own motion.

§ 555.9 Temporary exemption labels.

A manufacturer of an exempted vehicle shall—

(a) Submit to the Administrator, within 30 days after receiving notification of the grant of an exemption, a sample of the certification label required by part 567 of this chapter and paragraph (c) of this section;

(b) Affix securely to the windshield or side window of each exempted vehicle a label in the English language containing the statement required by paragraph (c)(1) or (2) of this section, and with the words “Shown above” omitted.

(c) Meet all applicable requirements of part 567 of this chapter, except that—

(1) The statement required by §567.4(g)(5) of this chapter shall end with the phrase “except for Standards Nos. [listing the standards by number and title for which an exemption has been granted] exempted pursuant to NHTSA Exemption No. llllllll.

(2) Instead of the statement required by §567.5(c)(7)(iii), the following statement shall appear:

THIS VEHICLE CONFORMS TO ALL APPLICABLE FEDERAL MOTOR VEHICLE SAFETY (AND BUMPER) STANDARDS IN EFFECT IN [Month, Year] EXCEPT FOR STANDARD NOS. [Listing the standards by number and title for which an exemption has been granted] EXEMPTED PURSUANT TO NHTSA EXEMPTION NO. lllllllll.

§ 555.10 Availability for public inspection.

(a) Information relevant to an application under this part, including the application and supporting data, memoranda of informal meetings with the applicant or any other interested person, and the grant or denial of the application, is available for public inspection, except as specified in paragraph (b) of this section, in Room PL–401 (Docket Management), 400 Seventh Street, SW., Washington, DC 20590. Copies of available information may be obtained, as provided in Part 7 of the regulations of the Office of the Secretary of Transportation (49 CFR part 7).
§ 555.12 Petition for exemption.

An alterer; an incomplete vehicle manufacturer intending to certify the vehicle in accordance with 49 CFR 567.5(f); an intermediate manufacturer intending to certify the vehicle in accordance with 49 CFR 567.5(g); a final-stage manufacturer; or an industry trade association representing a group of alterers, incomplete vehicle manufacturers, intermediate manufacturers and/or final-stage manufacturers may seek, as to any vehicle configuration altered and/or built in two or more stages, a temporary exemption or a renewal of a temporary exemption from any performance requirement for which a Federal motor vehicle safety standard specifies the use of a dynamic test procedure to determine compliance. Each petition for an exemption under this section must be submitted to NHTSA and must:

(a) Be written in the English language;

(b) Be submitted in three copies to: Administrator, National Highway Traffic Safety Administration, 400 Seventh St., SW., Washington, DC 20590;

(c) State the full name and address of the applicant, the nature of its organization (e.g., individual, partnership, corporation, or trade association), the name of the State or country under the laws of which it is organized, and the name of each alterer, incomplete vehicle manufacturer, intermediate manufacturer and/or final-stage manufacturer for which the exemption is sought;

(d) State the number, title, paragraph designation, and the text or substance of the portion(s) of the standard(s) from which the exemption is sought;

(e) Describe by type and use each vehicle configuration (or range of vehicle configurations) for which the exemption is sought;

(f) State the estimated number of units of each vehicle configuration to be produced annually by each of the manufacturer(s) for whom the exemption is sought;

(g) Specify any part of the information and data submitted that the petitioner requests be withheld from public disclosure in accordance with part 512 of this chapter, as provided by §555.5(b)(6).

[71 FR 28196, May 15, 2006]
§ 555.13 Basis for petition.

The petition shall:

(a) Discuss any factors (e.g., demand for the vehicle configuration, loss of market, difficulty in procuring goods and services necessary to conduct dynamic tests) that the applicant desires NHTSA to consider in deciding whether to grant the application based on economic hardship.

(b) Explain the grounds on which the applicant asserts that the application of the dynamic test requirements of the standard(s) in question to the vehicles covered by the application would cause substantial economic hardship to each of the manufacturers on whose behalf the application is filed, providing a complete financial statement for each manufacturer and a complete description of each manufacturer’s good faith efforts to comply with the standards, including a discussion of:

(1) The extent that no Type (1) or Type (2) statement with respect to such standard is available in the incomplete vehicle document furnished, per part 568 of this chapter, by the incomplete vehicle manufacturer or by a prior intermediate-stage manufacturer or why, if one is available, it cannot be followed;

(2) A description of the incomplete vehicle to be used to manufacture the vehicle(s) subject to the petition. This description must identify the manufacturer of the incomplete vehicle, state the incomplete vehicle’s GVWR, and provide other available specifications;

(3) The availability of alternative incomplete vehicles, including incomplete vehicles of different size, GVWR, and number of axles, from the same and other incomplete vehicle manufacturers, that could allow the petitioner to rely on Incomplete Vehicle Documents when certifying the completed vehicle, instead of petitioning under this subpart;

(4) The existence, or lack thereof, of generic or cooperative testing that would provide a basis for demonstrating compliance with the standard(s); and

(c) Explain why the requested temporary exemption would not unreasonably degrade safety.

[71 FR 28196, May 15, 2006]

§ 555.14 Processing of petitions.

The Administrator shall notify the petitioner whether the petition is complete within 30 days of receipt. The Administrator shall attempt to approve or deny any complete petition submitted under this subpart within 120 days after the agency acknowledges that the application is complete. Upon good cause shown, the Administrator may review a petition on an expedited basis.

§ 555.15 Time period for exemptions.

Subject to §555.16, each temporary exemption granted by the Administrator under this subpart shall be in effect for a period of three years from the effective date. The Administrator shall identify each exemption by a unique number.

§ 555.16 Renewal of exemptions.

An alterer, intermediate or final-stage manufacturer or a trade association representing a group of alterers or, intermediate and/or final-stage manufacturers may apply for a renewal of a temporary exemption. Any such renewal petition shall be filed at least 60 days prior to the termination date of the existing exemption and shall include all the information required in an initial petition. If a petition for renewal of a temporary exemption that meets the requirements of this subpart has been filed not later than 60 days before the termination date of an exemption, the exemption does not terminate until the Administrator grants or denies the petition for renewal.

§ 555.17 Termination of temporary exemptions.

The Administrator may terminate or modify a temporary exemption if (s)he determines that:

(a) The temporary exemption was granted on the basis of false, fraudulent, or misleading representations or information; or

(b) The temporary exemption is no longer consistent with the public interest and the objectives of the Act.

§ 555.18 Temporary exemption labels.

An alterer or final-stage manufacturer of a vehicle that is covered by
§ 556.4 Petition for exemption.

(a) A manufacturer who has determined the existence, in a motor vehicle or item of replacement equipment that he produces, of a defect related to motor vehicle safety or a noncompliance with an applicable Federal motor vehicle safety standard, or who has received notice of an initial determination by the NHTSA of the existence of a defect related to motor vehicle safety or a noncompliance, may petition for exemption from the Act’s notification and remedy requirements on the grounds that the defect or noncompliance is inconsequential as it relates to motor vehicle safety.

(b) Each petition submitted under this part shall—

(1) Be written in the English language;
(2) Be submitted in three copies to: Administrator, National Highway Traffic Safety Administration, Washington, DC 20590;
(3) State the full name and address of the applicant, the nature of its organization (e.g., individual, partnership, or corporation) and the name of the State or country under the laws of which it is organized.
(4) Describe the motor vehicle or item of replacement equipment, including the number involved and the period of production, and the defect or noncompliance concerning which an exemption is sought; and
(5) Set forth all data, views, and arguments of the petitioner supporting his petition.

(6) Be accompanied by three copies of the report the manufacturer has submitted, or is submitting, to NHTSA in accordance with part 573 of this chapter, relating to its determination of the existence of safety related defect or noncompliance with an applicable safety standard that is the subject of the petition.

(c) In the case of defects related to motor vehicle safety or noncompliances determined to exist by a manufacturer, petitions under this part must be submitted not later than 30 days after such determination. In the case of defects related to motor vehicle safety or noncompliances initially determined to exist by the NHTSA, petitions must be submitted not later than 30 days after notification of the determination has been received by the manufacturer. Such a petition will not...
§ 556.5 Processing of petition.

(a) The NHTSA publishes a notice of each petition in the Federal Register. Such notice includes:

(1) A brief summary of the petition;
(2) A statement of the availability of the petition and other relevant information for public inspection; and
(3)(i) In the case of a defect related to motor vehicle safety or a noncompliance determined to exist by the manufacturer, an invitation to interested persons to submit written data, views, and arguments concerning the petition, and, upon request by the petitioner or interested persons, a statement of the time and place of a public meeting at which such materials may be presented orally if any person so desires.
(ii) In the case of a defect related to motor vehicle safety or a noncompliance initially determined to exist by the NHTSA, an invitation to interested persons to submit written data, views, and arguments concerning the petition or to submit such data, views, and arguments orally at the meeting held pursuant to section 152(a) of the Act following the initial determination, or at a separate meeting if deemed appropriate by the agency.

§ 556.6 Meetings.

(a) At a meeting held under this part, any interested person may make oral (as well as written) presentations of data, views, and arguments on the question whether the defect or noncompliance described in the Federal Register notice is inconsequential as it relates to motor vehicle safety.

(b) Sections 556 and 557 of Title 5, U.S.C., do not apply to any meeting held under this part. Unless otherwise specified, any meeting held under this part is an informal, nonadversary, fact-finding proceeding, at which there are no formal pleadings or adverse parties. A decision to grant or deny a petition, after a meeting on such petition, is not necessarily based exclusively on the record of the meeting.

(c) The Administrator designates a representative to conduct any meeting held under this part. The Chief Counsel designates a member of his staff to serve as legal officer at the meeting. A transcript of the proceeding is kept and exhibits may be kept as part of the transcript.

§ 556.7 Disposition of petition.

Notice of either a grant or denial of a petition for exemption from the notice and remedy requirements of the Act based upon the inconsequentiality of a defect or noncompliance is issued to the petitioner and published in the Federal Register. The effect of a grant of a petition is to relieve the manufacturer from any further responsibility to provide notice and remedy of the defect or noncompliance. The effect of a denial is to continue in force, as against a manufacturer, all duties contained in the Act relating to notice and remedy of the defect or noncompliance. Any interested person may appeal the grant or denial of a petition by submitting written data, views, or arguments to the Administrator.

§ 556.8 Rescission of decision.

The Administrator may rescind a grant or denial of an exemption issued under this part any time after the receipt of new data and notice and opportunity for comment thereon, in accordance with §§556.5 and 556.7.

§ 556.9 Public inspection of relevant information.

Information relevant to a petition under this part, including the petition and supporting data, memoranda of informal meetings with the petitioner or any other interested person concerning the petition, and the notice granting or denying the petition, are available for public inspection in the Docket Section, Room 5109, National Highway Traffic Safety Administration, 400 Seventh Street, SW., Washington, DC 20590. Copies of available information may be obtained in accordance with part 7 of the regulations of the Office of...
§ 557.1 Scope.

This part establishes procedures under section 156 of the National Traffic and Motor Vehicle Safety Act of 1966, as amended (88 Stat. 1470, 15 U.S.C. 1416), for the submission and disposition of petitions filed by interested persons for hearings on the question of whether a manufacturer has reasonably met his obligation to notify owners, purchasers, and dealers of a safety-related defect or failure to comply with a Federal motor vehicle safety standard, or to remedy such defect or failure to comply. This part also establishes procedures for holding a hearing on these questions.

§ 557.2 Purpose.

The purpose of this part is to enable the National Highway Traffic Safety Administration to identify and respond on a timely basis to petitions for hearings on whether a manufacturer has reasonably met his obligation to notify or remedy, and to establish the procedures for such hearings.

§ 557.3 General.

Any interested person may file with the Administrator a petition requesting him to hold a hearing on—

(a) Whether a manufacturer has reasonably met his obligation to notify owners, purchasers, and dealers of a safety-related defect in any motor vehicle or item of replacement equipment manufactured by him;

(b) Whether a manufacturer has reasonably met his obligation to notify owners, purchasers, and dealers of a failure to comply with an applicable Federal motor vehicle safety standard in any motor vehicle or item of replacement equipment manufactured by him;

(c) Whether the manufacturer has reasonably met his obligation to remedy a safety-related defect in any motor vehicle or item of replacement equipment manufactured by him; or

(d) Whether the manufacturer has reasonably met his obligation to remedy a failure to comply with an applicable Federal motor vehicle safety standard in any motor vehicle or item of replacement equipment manufactured by him.

§ 557.4 Requirements for petition.

A petition filed under this part should be addressed and submitted to: Administrator, National Highway Traffic Safety Administration, 400 Seventh Street, SW., Washington, DC 20590. Each petition filed under this part must—

(a) Be written in the English or Spanish language;

(b) Have, preceding its text, the word “Petition”;

(c) Contain a brief statement concerning the alleged failure of a manufacturer to meet reasonably his obligation to notify or remedy;

(d) Contain a brief summary of the data, views, or arguments that the petitioner wishes to present in a hearing on whether or not a manufacturer has reasonably met his obligations to notify or remedy;

(e) Specifically request a hearing.

§ 557.5 Improperly filed petitions.

(a) A petition that is not addressed as specified in § 557.4, but that meets the other requirements of that section, will
§ 557.6 Determination whether to hold a public hearing.

(a) The Administrator considers the following factors in determining whether to hold a hearing:
(1) The nature of the complaint;
(2) The seriousness of the alleged breach of obligation to remedy;
(3) The existence of similar complaints;
(4) The ability of the NHTSA to resolve the problem without holding a hearing; and
(5) Other pertinent matters.

(b) If, after considering the above factors, the Administrator determines that a hearing should be held, the petition is granted. If it is determined that a hearing should not be held, the petition is denied. In either case, the petitioner is notified of the grant or denial not more than 60 days after receipt of the petition by the NHTSA.

(c) If a petition submitted under this part is denied, a FEDERAL REGISTER notice of the denial is issued within 45 days of the denial, setting forth the reasons for it.

(d) The Administrator may conduct a hearing under this part on his own motion.

§ 557.7 Public hearing.

If the Administrator decides that a public hearing under this part is necessary, he issues a notice of public hearing in the FEDERAL REGISTER, to advise interested persons of the time, place, and subject matter of the public hearing and invite their participation. Interested persons may submit their views through oral or written presentation, or both. There is no cross-examination of witnesses. A transcript of the hearing is kept and exhibits may be accepted as part of the transcript. Sections 556 and 557 of title 5, U.S.C., do not apply to hearings held under this part. When appropriate, the Chief Counsel designates a member of his staff to serve as legal officer at the hearing.

§ 557.8 Determination of manufacturer's obligation.

If the Administrator determines, on the basis of the information presented at a hearing or any other information that is available to him, that the manufacturer has not reasonably met his obligation to notify owners, dealers, and purchasers of a safety-related defect or failure to comply with a Federal motor vehicle safety standard or to remedy such defect or failure to comply, he orders the manufacturer to take specified action to comply with his obligation, consistent with the authority granted the Administrator by the Act.

PART 563—EVENT DATA RECORDERS

Sec.
563.1 Scope.
563.2 Purpose.
563.3 Application.
563.4 [Reserved]
563.5 Definitions.
563.6 Requirements for vehicles.
563.7 Data elements.
563.8 Data format.
563.9 Data capture.
563.10 Crash test performance and survivability.
563.11 Information in owner's manual.
563.12 Data retrieval tools.

SOURCE: 71 FR 51043, Aug. 28, 2006, unless otherwise noted.

§ 563.1 Scope.

This part specifies uniform, national requirements for vehicles equipped with event data recorders (EDRs) concerning the collection, storage, and retrievability of onboard motor vehicle crash event data. It also specifies requirements for vehicle manufacturers...
§ 563.2 Purpose.

The purpose of this part is to help ensure that EDRs record, in a readily usable manner, data valuable for effective crash investigations and for analysis of safety equipment performance (e.g., advanced restraint systems). These data will help provide a better understanding of the circumstances in which crashes and injuries occur and will lead to safer vehicle designs.

§ 563.3 Application.

This part applies to the following vehicles manufactured on or after September 1, 2012, if they are equipped with an event data recorder: passenger cars, multipurpose passenger vehicles, trucks, and buses with a GVWR of 3,855 kg (8,500 pounds) or less and an unloaded vehicle weight of 2,495 kg (5,500 pounds) or less, except for walk-in van-type trucks or vehicles designed to be sold exclusively to the U.S. Postal Service. This part also applies to manufacturers of those vehicles. However, vehicles manufactured before September 1, 2013 that are manufactured in two or more stages or that are altered (within the meaning of 49 CFR 567.7) after having been previously certified to the Federal motor vehicle safety standards in accordance with part 567 of this chapter need not meet the requirements of this part.

§ 563.4 [Reserved]

§ 563.5 Definitions.

(a) Motor vehicle safety standard definitions. Unless otherwise indicated, all terms that are used in this part and are defined in the Motor Vehicle Safety Standards, part 571 of this subchapter, are used as defined therein.

(b) Other definitions.

ABS activity means the anti-lock brake system (ABS) is actively controlling the vehicle’s brakes.

Air bag warning lamp status means whether the warning lamp required by FMVSS No. 208 is on or off.

Capture means the process of buffering EDR data in a temporary, volatile storage medium where it is continuously updated at regular time intervals.

Delta–V, lateral means the cumulative change in velocity, as recorded by the EDR of the vehicle, along the lateral axis, starting from crash time zero and ending at 0.25 seconds, recorded every 0.01 seconds.

Delta–V, longitudinal means the cumulative change in velocity, as recorded by the EDR of the vehicle, along the longitudinal axis, starting from crash time zero and ending at 0.25 seconds, recorded every 0.01 seconds.

Deployment time, frontal air bag means (for both driver and right front passenger) the elapsed time from crash time zero to the deployment command, or for multi-staged air bag systems, the deployment command for the first stage.

Disposal means the deployment command of the second (or higher, if present) stage of a frontal air bag for the purpose of disposing the propellant from the air bag device.

End of event time means the moment at which the cumulative delta–V within a 20 ms time period becomes 0.8 km/h (0.5 mph) or less, or the moment at which the crash detection algorithm of the air bag control unit resets.

Engine RPM means

(1) For vehicles powered by internal combustion engines, the number of revolutions per minute of the main crankshaft of the vehicle’s engine; and

(2) For vehicles not entirely powered by internal combustion engines, the number of revolutions per minute of the motor shaft at the point at which it enters the vehicle transmission gearbox.

Engine throttle, percent full means the driver-requested acceleration as measured by the throttle position sensor on the accelerator pedal compared to the fully-depressed position.

Event means a crash or other physical occurrence that causes the trigger threshold to be met or exceeded, or an air bag to be deployed, whichever occurs first.

Event data recorder (EDR) means a device or function in a vehicle that
records the vehicle's dynamic time-series data during the time period just prior to a crash event (e.g., vehicle speed vs. time) or during a crash event (e.g., delta-V vs. time), intended for retrieval after the crash event. The purposes of this definition, the event data do not include audio and video data.

*Frontal air bag* means an inflatable restraint system that requires no action by vehicle occupants and is used to meet the applicable frontal crash protection requirements of FMVSS No. 208.

*Ignition cycle, crash* means the number (count) of power cycles applied to the recording device at the time when the crash event occurred since the first use of the EDR.

*Ignition cycle download* means the number (count) of power cycles applied to the recording device at the time when the data was downloaded since the first use of the EDR.

*Lateral acceleration* means the component of the vector acceleration of a point in the vehicle in the y-direction. The lateral acceleration is positive from left to right, from the perspective of the driver when seated in the vehicle facing the direction of forward vehicle travel.

*Longitudinal acceleration* means the component of the vector acceleration of a point in the vehicle in the x-direction. The longitudinal acceleration is positive in the direction of forward vehicle travel.

*Maximum delta-V, lateral* means the maximum value of the cumulative change in velocity, as recorded by the EDR, of the vehicle along the lateral axis, starting from crash time zero and ending at 0.3 seconds.

*Maximum delta-V, longitudinal* means the maximum value of the cumulative change in velocity, as recorded by the EDR, of the vehicle along the longitudinal axis, starting from crash time zero and ending at 0.3 seconds.

*Maximum delta-V, resultant* means the time-correlated maximum value of the cumulative change in velocity, as recorded by the EDR or processed during data download, along the vector-added longitudinal and lateral axes.

*Multi-event crash* means the occurrence of 2 events, the first and last of which begin not more than 5 seconds apart.

*Non-volatile memory* means the memory reserved for maintaining recorded EDR data in a semi-permanent fashion. Data recorded in non-volatile memory is retained after loss of power and can be retrieved with EDR data extraction tools and methods.

*Normal acceleration* means the component of the vector acceleration of a point in the vehicle in the z-direction. The normal acceleration is positive in a downward direction and is zero when the accelerometer is at rest.

*Occupant position classification* means the classification indicating that the seating posture of a front outboard occupant (both driver and right front passenger) is determined as being out-of-position.

*Occupant size classification* means, for the right front passenger, the classification of the occupant as an adult and not as a child, and for the driver, the classification of the driver as not being of small stature.

*Pretensioner* means a device that is activated by a vehicle's crash sensing system and removes slack from a vehicle safety belt system.

*Record* means the process of saving captured EDR data into a non-volatile device for subsequent retrieval.

*Safety belt status* means the feedback from the safety system that is used to determine that an occupant's safety belt (for both driver and right front passenger) is fastened or unfastened.

*Seat track position switch, foremost, status* means the status of the switch that is installed to detect whether the seat is moved to a forward position.

*Service brake, on and off* means the status of the device that is installed in or connected to the brake pedal system to detect whether the pedal was pressed. The device can include the brake pedal switch or other driver-operated service brake control.

*Side air bag* means any inflatable occupant restraint device that is mounted to the seat or side structure of the vehicle interior, and that is designed to deploy in a side impact crash to help mitigate occupant injury and/or ejection.

*Side curtain/tube air bag* means any inflatable occupant restraint device that...
Nat’l Highway Traffic Safety Admin., DOT  § 563.5

is mounted to the side structure of the vehicle interior, and that is designed to deploy in a side impact crash or rollover and to help mitigate occupant injury and/or ejection.

Speed, vehicle indicated means the vehicle speed indicated by a manufacturer-designated subsystem designed to indicate the vehicle’s ground travel speed during vehicle operation.

Stability control means any device that complies with FMVSS No. 126, “Electronic stability control systems.”

Steering input means the angular displacement of the steering wheel measured from the straight-ahead position (position corresponding to zero average steer angle of a pair of steered wheels).

Suppression switch status means the status of the switch indicating whether an air bag suppression system is on or off.

Time from event 1 to 2 means the elapsed time from time zero of the first event to time zero of the second event.

Time, maximum delta–V, lateral means the time from crash time zero to the point where the maximum value of the cumulative change in velocity is found, as recorded by the EDR, along the lateral axis.

Time, maximum delta–V, longitudinal means the time from crash time zero to the point where the maximum value of the cumulative change in velocity is found, as recorded by the EDR, along the longitudinal axis.

Time, maximum delta–V, resultant means the time from crash time zero to the point where the maximum delta–V resultant occurs, as recorded by the EDR or processed during data download.

Time to deploy, pretensioner means the elapsed time from crash time zero to the deployment command for the safety belt pretensioner (for both driver and right front passenger).

Time to deploy, side air bag/curtain means the elapsed time from crash time zero to the deployment command for a side air bag or a side curtain/tube air bag (for both driver and right front passenger).

Time to first stage means the elapsed time between time zero and the time when the first stage of a frontal air bag is commanded to fire.
§ 563.6 Z-direction means in the direction of the vehicle’s Z-axis, which is perpendicular to the X- and Y-axes. The Z-direction is positive in a downward direction.

[73 FR 2180, Jan. 14, 2008]

§ 563.6 Requirements for vehicles.

Each vehicle equipped with an EDR must meet the requirements specified in §563.7 for data elements, §563.8 for data format, §563.9 for data capture, §563.10 for crash test performance and survivability, and §563.11 for information in owner’s manual.

§ 563.7 Data elements.

(a) Data elements required for all vehicles. Each vehicle equipped with an EDR must record all of the data elements listed in Table I, during the interval/time and at the sample rate specified in that table.

TABLE I—DATA ELEMENTS REQUIRED FOR ALL VEHICLES EQUIPPED WITH AN EDR

<table>
<thead>
<tr>
<th>Data element</th>
<th>Recording interval/time(^1) (relative to time zero)</th>
<th>Data sample rate (samples per second)</th>
</tr>
</thead>

</table>
(b) Acceleration Time-History data and format: the longitudinal, lateral, and normal acceleration time-history data, as applicable, must be filtered either during the recording phase or during the data downloading phase to include:

(1) The Time Step (TS) that is the inverse of the sampling frequency of the acceleration data and which has units of seconds;

(2) The number of the first point (NFP), which is an integer that when multiplied by the TS equals the time relative to time zero of the first acceleration data point;

(3) The number of the last point (NLP), which is an integer that when multiplied by the TS equals the time relative to time zero of the last acceleration data point; and

(4) NLP—NFP + 1 acceleration values sequentially beginning with the acceleration at time NFP * TS and continue sampling the acceleration at TS increments in time until the time NLP * TS is reached.

§ 563.9 Data capture.

The EDR must capture and record the data elements for events in accordance with the following conditions and circumstances:

(a) In a frontal or side air bag deployment crash, capture and record the current deployment data, up to two events. The memory for each air bag deployment event must be locked to prevent any future overwriting of these data.

(b) In a deployment event that involves another type of deployable restraint (e.g., pretensioners, knee bolsters, pedestrian protection, etc.), or in a non-deployment event that meets the trigger threshold, capture and record the current non-deployment data, up to two events, subject to the following conditions:

(1) If an EDR non-volatile memory buffer void of previous-event data is available, the current non-deployment event data is recorded in the buffer.

(2) If an EDR non-volatile memory buffer void of previous-event data is not available, the manufacturer may choose either to overwrite the previous non-deployment event data with the current non-deployment event data, or not to record the current non-deployment event data.

(3) EDR buffers containing previous deployment-event data must not be overwritten by the current non-deployment event data.

§ 563.11 Information in owner’s manual.

(a) The owner’s manual in each vehicle covered under this regulation must provide the following statement in English:

This vehicle is equipped with an event data recorder (EDR). The main purpose of an EDR is to record, in certain crash or near crash-like situations, such as an air bag deployment or hitting a road obstacle, data that will assist in understanding how a vehicle’s systems performed. The EDR is designed to record data related to vehicle dynamics and safety systems for a short period of time, typically 30 seconds or less. The EDR in this vehicle is designed to record such data as:

- How various systems in your vehicle were operating;
- Whether or not the driver and passenger safety belts were buckled/fastened;
- How far (if at all) the driver was depressing the accelerator and/or brake pedal; and,
- How fast the vehicle was traveling.

These data can help provide a better understanding of the circumstances in which crashes and injuries occur. NOTE: EDR data are recorded by your vehicle only if a non-trivial crash situation occurs; no data are recorded by the EDR under normal driving conditions and no personal data (e.g., name, gender, age, and crash location) are recorded. However, other parties, such as law enforcement, could combine the EDR data with the type of personally identifying data routinely acquired during a crash investigation.

To read data recorded by an EDR, special equipment is required, and access to the vehicle or the EDR is needed. In addition to the vehicle manufacturer, other parties, such as law enforcement, that have the special equipment, can read the information if they have access to the vehicle or the EDR.

(b) The owner’s manual may include additional information about the form, function, and capabilities of the EDR, in supplement to the required statement in §563.11(a).

§ 563.12 Data retrieval tools.

Each manufacturer of a motor vehicle equipped with an EDR shall ensure by licensing agreement or other means that a tool(s) is commercially available that is capable of accessing and retrieving the data stored in the EDR that are required by this part. The tool(s) shall be commercially available not later than 90 days after the first sale of the motor vehicle for purposes other than resale.
§ 564.2 Purposes.

The purposes of this part are achieved through its Appendices:

(a) The purposes of appendix A of this part are to ensure

(1) The availability to replacement light source manufacturers of the manufacturing specifications of original equipment light sources so that replacement light sources are interchangeable with original equipment light sources and provide equivalent performance, and

(2) That redesigned or newly developed light sources are designated as distinct, different, and noninterchangeable with previously existing light sources.

(b) The purposes of Appendix B of this part are to ensure

(1) That original equipment light sources are replaceable and that replacement light sources provide equivalent performance, and

(2) That redesignated or newly developed light sources are designated as distinct, different, and noninterchangeable with previously existing light sources.

[61 FR 20500, May 7, 1996]

§ 564.3 Applicability.

This part applies to replaceable light sources used as original equipment in motor vehicle headlighting systems.

[60 FR 14228, Mar. 16, 1995]

§ 564.4 Definitions.

All terms defined in the Act and the regulations and standards issued under its authority are used as defined therein.

§ 564.5 Information filing; agency processing of filings.

(a) Each manufacturer of a motor vehicle, original equipment headlamp, or original equipment headlamp replaceable light source, which intends to manufacture a replaceable light source as original equipment or to incorporate a replaceable light source in its headlamps or motor vehicles, shall furnish the information specified in Appendix A. If the rated laboratory life of the light source is not less than 2,000 hours, the manufacturer shall furnish the information specified in either Appendix A or Appendix B of this part. Information shall be furnished to: Associate Administrator for Safety Performance Standards, National Highway Traffic Safety Administration, 400 Seventh Street SW, Washington, D.C. 20590. Attention: Part 564—Replaceable Light Source Information (unless the agency has already filed such information in Docket No. NHTSA 98–3397).

(b) The manufacturer shall submit such information not later than 60 days before it intends to begin the manufacture of the replaceable light source to which the information applies, or to incorporate the light source into a headlamp or motor vehicle of its manufacture. Each submission shall consist of one original set of information and 10 legible reproduced copies, all on 8½ by 11-inch paper.

(c) The Associate Administrator promptly reviews each submission and informs the manufacturer not later than 30 days after its receipt whether the submission has been accepted. Upon acceptance, the Associate Administrator files the information in Docket No. NHTSA 98–3397. The Associate Administrator does not accept any submission that does not contain all the information specified in Appendix A or Appendix B of this part, or whose accompanying information indicates that any new light source which is the subject of a submission is interchangeable with any replaceable light source for which the agency has previously filed information in Docket No. NHTSA 98–3397.

(d) A manufacturer may request modification of a light source for which information has previously been filed in Docket No. NHTSA 98–3397, and the submission shall be processed in the manner provided by § 564.5(c). A request for modification shall contain the following:

(1) All the information specified in Appendix A or Appendix B of this part that is relevant to the modification requested,

(2) The reason for the requested modification,

(3) A statement that use of the light source as modified will not create a noncompliance with any requirement of Motor Vehicle Safety Standard No.
108 (49 CFR 571.108) when used to replace an unmodified light source in a headlamp certified by its manufacturer as conforming to all applicable Federal motor vehicle safety standards, together with reasons in support of the statement; and

(4) Information demonstrating that the modification would not adversely affect interchangeability with the original light source.

After review of the request for modification, the Associate Administrator may seek further information either from the manufacturer or through a notice published in the FEDERAL REGISTER requesting comment on whether a modified light source incorporating the changes requested will create a noncompliance with Motor Vehicle Safety Standard No. 108 when substituted for an unmodified light source. If the Associate Administrator seeks comment public comment on a submission, (s)he shall publish a further notice stating whether (s)he has accepted or rejected the submission. If a submission is accepted, the Associate Administrator files the information in Docket No. NHTSA 98–3397. If a submission is rejected, a manufacturer may submit information with respect to it, provided in paragraph 564.5(a), for consideration as a new light source after such changes as will ensure that it is not interchangeable with the light source for which modification was originally requested.

(e) Information submitted under this section is made available by NHTSA for public inspection as soon as practicable after its receipt, but not later than the date on which a vehicle equipped with a new or revised replaceable light source is offered for sale.

APPENDIX A TO PART 564—INFORMATION TO BE SUBMITTED FOR REPLACEABLE LIGHT SOURCES

I. Filament or Discharge Arc Position Dimensions and Tolerances Using Either Direct Filament or Discharge Arc Dimensions or the Three Dimensional Filament or Discharge Arc Tolerance Box.

A. Lower beam filament dimensions or filament tolerance box dimensions and relation of these to the bulb base reference plane and centerline.

1. Axial location of the filament centerline or the filament tolerance box relative to the bulb base reference plane.

2. Vertical location of the filament centerline or the filament tolerance box relative to the bulb base centerline.

3. Transverse location of the filament centerline or the filament tolerance box relative to the bulb base centerline.

4. Filament tolerance box dimensions, if used.

B. Upper beam filament dimensions or the filament tolerance box dimensions, and relation of these to the bulb base reference plane and centerline.

1. Axial location of the filament centerline or the filament tolerance box relative to the bulb base reference plane.

2. Vertical location of the filament centerline or the filament tolerance box relative to the bulb base centerline.

3. Transverse location of the filament centerline or the filament tolerance box relative to the bulb base centerline.

4. Filament tolerance box dimensions, if used.

C. If the replaceable light source has both a lower beam and an upper beam filament, the dimensional relationship between the two filament centerlines or the filament tolerance boxes may be provided instead of referencing the upper beam filament centerline or filament tolerance box to the bulb base centerline or reference plane.

D. For a light source using excited gas mixtures as a filament, necessary fiducial information and specifications including electrode position dimensions and tolerance information that provide similar location and characteristics information required by paragraphs A, B, and C of this section for light sources using a resistive type filament.

II. Dimensions Pertaining to Filament Capsule and Capsule Supports

A. Maximum length from bulb base reference plane to tip of filament capsule.

B. Maximum radial distances from bulb base centerline to periphery of filament capsule and/or supports.

C. Location of black cap relative to lower beam filament centerline, filament tolerance box or other to-be-specified reference.

D. Size, length, shape, or other pertinent features and dimensions for providing undistorted walls for the filament capsule.

III. Bulb Base Interchangeability Dimensions and Tolerance

A. Angular locations, diameters, key/keyway sizes, and any other interchangeability dimensions for indexing the bulb base in the bulb holder.
B. Diameter, width, depth, and surface finish of seal groove, surface, or other pertinent sealing features.
C. Diameter of the bulb base at the interface of the base and its perpendicular reference surface.
D. Dimensions of features related to retention of the bulb base in the bulb holder such as tabs, keys, keyways, surfaces, etc.

IV. Bulb Holder Interchangeability Dimensions and Tolerance
A. Mating angular locations, diameters, key/keyway sizes, and any other interchangeability dimensions for indexing the bulb base in the bulb holder.
B. Mating diameter, width, depth, and surface finish of seal groove, surface, or other pertinent sealing features.
C. Mating diameter of the bulb holder at the interface of the bulb base aperture and its perpendicular reference surface.
D. Mating dimensions of features related to retention of the bulb base in the bulb holder such as tabs, keys, keyways, surfaces, etc.

V. Wiring Harness Connector to Bulb Base Interchangeability Dimensions and Tolerances
A. Maximum depth of harness connector insertion into bulb base.
B. Location of electrical pins in bulb base.
C. Dimensions of electrical pins in bulb base—length, diameter, width, thickness and etc.
D. Fit of harness connector into bulb base providing all necessary dimensions, key/keyway controls, and dimensions, tapers etc.
E. Dimensions and location of locking features for wiring harness connector to bulb base.
F. Identification of upper beam, lower beam, and common terminals.

VI. SEAL SPECIFICATIONS (IF REPLACEABLE LIGHT SOURCE IS INTENDED TO BE OF A SEALED BASE DESIGN)
A. Type.
B. Material.
C. Dimensions.

VII. Electrical Specifications for Each Filament at 12.8 Volts
A. Maximum power (in watts).
B. Luminous Flux with tolerance (in lumens) with black cap if so equipped, measured in accordance with the document: Illuminating Engineering Society of North America, LM-45; IES Approved Method for Electrical and Photometric Measurements of General Service Incandescent Filament Lamps (April 1988).

VIII. Bulb Markings/Designation—ANSI NUMBER, ECE IDENTIFIER, MANUFACTURER’S PART NUMBER, INDIVIDUALLY OR IN ANY COMBINATION

IX. All other information, dimensions or performance specifications necessary for interchangeability, replaceability, or system test purposes not listed in sections I through VIII. If a ballast is required for operation, a complete listing of the requirements and parameters between the light source and ballast, and ballast and the vehicle shall also be provided.

[58 FR 3860, Jan. 12, 1993, as amended at 61 FR 20500, 20501, May 7, 1996]

APPENDIX B TO PART 564—INFORMATION TO BE SUBMITTED FOR LONG LIFE REPLACEABLE LIGHT SOURCES OF LIMITED DEFINITION
I. Filament or Discharge Arc Position Dimensions and Tolerances Using Either Direct Filament or Discharge Arc Dimensions or the Three Dimensional Filament Discharge Arc Tolerance Box.
A. Lower beam filament or discharge arc dimensions or filament or discharge arc tolerance box dimensions and relation of these to the bulb base reference plane and centerline.
1. Axial location of the filament or discharge arc centerline or the filament or discharge arc tolerance box relative to the bulb base reference plane.
2. Vertical location of the filament or discharge arc centerline or the filament or discharge arc tolerance box relative to the bulb base centerline.
3. Transverse location of the filament or discharge arc centerline or the filament or discharge arc tolerance box relative to the bulb base centerline.
4. Filament or discharge arc tolerance box dimensions, if used.
B. Upper beam filament or discharge arc dimensions or the filament or discharge arc tolerance box dimensions and relation of these to the bulb base reference plane and centerline.
1. Axial location of the filament or discharge arc centerline or the filament or discharge arc tolerance box relative to the bulb base reference plane.
2. Vertical location of the filament or discharge arc centerline or the filament or discharge arc tolerance box relative to the bulb base centerline.
3. Transverse location of the filament or discharge arc centerline or the filament or discharge arc tolerance box relative to the bulb base centerline.
4. Filament or discharge arc tolerance box dimensions, if used.
C. If the replaceable light source has both a lower beam and upper beam filament or discharge arc, the dimensional relationship between the two filament or discharge arc centerlines or the filament or discharge arc tolerance boxes may be provided instead of referencing the upper beam filament or discharge arc centerline or filament or discharge arc tolerance box to the bulb base centerline or reference plane.

D. For a light source using excited gas mixtures as a filament, necessary fiducial information and specifications including electrode position dimensions, and tolerance information that provide similar location and characteristics information required by paragraphs A, B, and C of this section I for light sources using a resistive type filament.

II. Bulb Base Interchangeability Dimensions and Tolerance.

A. Angular locations, diameters, key/keyway sizes, and any other interchangeability dimensions for indexing the bulb base in the bulb holder.

B. Diameter, width, depth, and surface finish of seal groove, surface, or other pertinent sealing features.

C. Diameter of the bulb base at the interface of the base and its perpendicular reference surface.

D. Dimensions of features related to retention of the bulb base in the bulb holder such as tabs, keys, keyways, surface, etc.

III. Bulb Holder Interchangeability Dimensions and Tolerances.

A. Mating angular locations, diameters, key/keyway sizes, any other interchangeability dimensions for indexing the bulb base in the bulb holder.

B. Mating diameter, width, depth, and surface, or other pertinent sealing features.

C. Mating diameter of the bulb holder at the interface of the bulb base aperture and its perpendicular reference surface.

D. Mating dimensions of features related to retention of the bulb base in the bulb holder such as tabs, keys, keyways, surface, or any other characteristics necessary for mating dimensions.

IV. Electrical Specifications for Each Light Source that Operates With a Ballast and Rated Life of the Light Source/Ballast Combination.

A. Maximum power (in watts).

B. Luminous Flux (in lumens).

C. Rated laboratory life of the light source/ballast combination (not less than 2,000 hours).

V. Applicable to Light Sources that Operate With a Source Voltage Other Than 12.8 Volts Direct Current, and When a Proprietary Ballast Must Be Used With the Light Source.

A. Manufacturer’s part number for the ballast.

B. Any other characteristics necessary for system operation.

VI. Bulb Markings/Designation—ANSI NUMBER, ECE IDENTIFIER, MANUFACTURER’S PART NUMBER, INDIVIDUAL OR IN ANY COMBINATION.

VII. All other identification, dimensions or performance specifications necessary for replaceability or systems test not listed in sections I through VI.

[61 FR 20500, May 7, 1996]

EFFECTIVE DATE NOTE: At 72 FR 68266, Dec. 4, 2007, part 564 was revised, effective Sept. 1, 2008. At 73 FR 50730, Aug. 28, 2008, the revision of part 564 was delayed until Dec. 1, 2009. For the convenience of the user, the revised text is set forth as follows:

PART 564—REPLACEABLE LIGHT SOURCE AND SEALED BEAM HEADLAMP INFORMATION

Sec. 564.1 Scope.

564.2 Purposes.

564.3 Applicability.

564.4 Definitions.

564.5 Information filing; agency processing of filings.

APPENDIX A TO PART 564—INFORMATION TO BE SUBMITTED FOR REPLACEABLE LIGHT SOURCES

APPENDIX B TO PART 564—INFORMATION TO BE SUBMITTED FOR LONG LIFE REPLACEABLE LIGHT SOURCES OF LIMITED DEFINITION

APPENDIX C TO PART 564—INFORMATION APPLICABLE TO STANDARDIZED SEALED BEAM HEADLAMP UNITS

§ 564.1 Scope.

This part requires the submission of dimensional, electrical specification, and marking/designation information as specified in appendices A and B of this part, for original equipment replaceable light sources used in motor vehicle headlighting systems. This part also serves as a repository for design information as specified in appendix C of this part, for original equipment and replacement standardized sealed beam units used in motor vehicle headlighting systems.

§ 564.2 Purposes.

The purposes of this part are achieved through its Appendices:
§ 564.3 Applicability.

This part applies to replaceable light sources used as original equipment, and standardized sealed beam headlamp units used as original equipment and replacement equipment in motor vehicle headlighting systems.

§ 564.4 Definitions.

All terms defined in the Act and the regulations and standards issued under its authority are used as defined therein.

§ 564.5 Information filing; agency processing of filings.

(a) Each manufacturer of a motor vehicle, original equipment headlamp, or original equipment headlamp replaceable light source, which intends to manufacture a replaceable light source as original equipment or to incorporate a replaceable light source in its headlamps or motor vehicles, shall furnish the information specified in appendix A. If the rated laboratory life of the light source is less than 2,000 hours, the manufacturer shall furnish the information specified in either appendix A or appendix B of this part. Information shall be furnished to:

1. The purposes of appendix A of this part are to ensure:

(1) The availability to replacement light source manufacturers of the manufacturing specifications of original equipment light sources so that replacement light sources are interchangeable with original equipment light sources and provide equivalent performance, and

(2) That redesigned or newly developed light sources are designated as distinct, different, and noninterchangeable with previously existing light sources.

(b) The purposes of appendix B of this part are to ensure:

(1) That original equipment light sources are replaceable and that replacement light sources provide equivalent performance, and

(2) That redesigned or newly developed light sources are designated as distinct, different, and noninterchangeable with previously existing light sources.

(c) The purpose of appendix C of this part is to ensure the availability to original equipment and replacement sealed beam headlamp manufacturers of the manufacturing specifications of standardized sealed beam headlamp units used on motor vehicles so that all sealed beam headlamp units of a specific type are interchangeable with all other units of that same type and provide equivalent performance.

After review of the request for modification, the Associate Administrator may seek further information either from the manufacturer or through a notice published in the Federal Register requesting comment on whether a modified light source incorporating the changes requested will create a noncompliance with Federal Motor Vehicle Safety Standard No. 108 when substituted for an unmodified light source. If the Associate Administrator seeks public comment on a
APPENDIX A TO PART 564—INFORMATION TO BE SUBMITTED FOR REPLACEABLE LIGHT SOURCES

I. Filament or Discharge Arc Position Dimensions and Tolerances Using Either Direct Filament or Discharge Arc Dimensions or the Three Dimensional Filament or Discharge Arc Tolerance Box

A. Lower beam filament dimensions or filament tolerance box dimensions and relation of these to the bulb base reference plane and centerline.
1. Axial location of the filament centerline or the filament tolerance box relative to the bulb base reference plane.
2. Vertical location of the filament centerline or the filament tolerance box relative to the bulb base centerline.
3. Transverse location of the filament centerline or the filament tolerance box relative to the bulb base centerline.
4. Filament tolerance box dimensions, if used.
B. Upper beam filament dimensions or the filament tolerance box dimensions, and relation of these to the bulb base reference plane and centerline.
1. Axial location of the filament centerline or the filament tolerance box relative to the bulb base reference plane.
2. Vertical location of the filament centerline or the filament tolerance box relative to the bulb base centerline.
3. Transverse location of the filament centerline or the filament tolerance box relative to the bulb base centerline.
4. Filament tolerance box dimensions, if used.
C. If the replaceable light source has both a lower beam and an upper beam filament, the dimensional relationship between the two filament centerlines or the filament tolerance boxes may be provided instead of referencing the upper beam filament centerline or filament tolerance box to the bulb base centerline or reference plane.

II. Dimensions Pertaining to Filament Capsule and Capsule Supports

A. Maximum length from bulb base reference plane to tip of filament capsule.
B. Maximum radial distances from bulb base centerline to periphery of filament capsule and/or supports.
C. Location of black cap relative to low beam filament centerline, filament tolerance box or other to-be-specified reference.
D. Size, length, shape, or other pertinent features and dimensions for providing undistorted walls for the filament capsule.

III. Bulb Base Interchangeability Dimensions and Tolerance

A. Angular locations, diameters, key/keyway sizes, and any other interchangeability dimensions for indexing the bulb base in the bulb holder.
B. Diameter, width, depth, and surface finish of seal groove, surface, or other pertinent sealing features.
C. Diameter of the bulb base at the interface of the base and its perpendicular reference surface.
D. Dimensions of features related to retention of the bulb base in the bulb holder such as tabs, keys, keyways, surfaces, etc.

IV. Bulb Holder Interchangeability Dimensions and Tolerance

A. Mating angular locations, diameters, key/keyway sizes, and any other interchangeability dimensions for indexing the bulb base in the bulb holder.
B. Mating diameter, width, depth, and surface finish of seal groove, surface, or other pertinent sealing features.
C. Mating diameter of the bulb holder at the interface of the bulb base aperture and its perpendicular reference surface.
D. Mating dimensions of features related to retention of the bulb base in the bulb holder such as tabs, keys, keyways, surfaces, etc.

V. Wiring Harness Connector to Bulb Base Interchangeability Dimensions and Tolerances

A. Maximum depth of harness connector insertion into bulb base.
B. Location of electrical pins in bulb base.
C. Dimensions of electrical pins in bulb base—length, diameter, width, thickness and etc.
D. Plug of harness connector into bulb base providing all necessary dimensions, key/ keyway controls, and dimensions, tapers etc.
E. Dimensions and location of locking features for wiring harness connector to bulb base.
F. Identification of upper beam, lower beam, and common terminals.

VI. Seal Specifications (if Replaceable Light Source is Intended to be of a Sealed Base Design)
A. Type.
B. Material.
C. Dimensions.

VII. Electrical Specifications for Each Filament at 12.8 Volts
A. Maximum power (in watts).
B. Luminous Flux with tolerance (in lumens) with black cap if so equipped, measured in accordance with the document: Illuminating Engineering Society of North America, LM-45: IES Approved Method for Electrical and Photometric Measurements of General Service Incandescent Filament Lamps (April 1980). This incorporation by reference was approved by the Director of the Federal Register in accordance with 5 U.S.C. 552(a) and 1 CFR part 51. Copies may be obtained from the Illuminating Engineering Society of North America, 345 East 47th St., New York, NY 10017. Copies may be inspected at the National Highway Traffic Safety Administration, Technical Information Services, 1200 New Jersey Avenue, Washington, DC 20590, or at the National Archives and Records Administration (NARA). For information on the availability of this material at NARA, call 202-741-6030, or go to: http://www.archives.gov/federal_register/code_of_federal_regulations/ibr_locations.html.

VIII. Bulb Markings/Designation—ANSI NUMBER, ECE IDENTIFIER, MANUFACTURER’S PART NUMBER, INDIVIDUALLY OR IN ANY COMBINATION

IX. All Other Information, Dimensions or Performance Specifications Necessary for Interchangeability, Replaceability, or System Test Purposes not Listed in Sections I Through VIII

IF A BALLAST IS REQUIRED FOR OPERATION, A COMPLETE LISTING OF THE REQUIREMENTS AND PARAMETERS BETWEEN THE LIGHT SOURCE AND BALLAST, AND BALLAST AND THE VEHICLE SHALL ALSO BE PROVIDED.

APPENDIX B TO PART 564—INFORMATION TO BE SUBMITTED FOR LONG LIFE REPLACEABLE LIGHT SOURCES OF LIMITED DEFINITION

I. Filament or Discharge Arc Position Dimensions and Tolerances Using Either Direct Filament or Discharge Arc Dimensions or the Three Dimensional Filament Discharge Arc Tolerance Box
A. Lower beam filament or discharge arc dimensions or filament or discharge arc tolerance box dimensions and relation of these to the bulb base reference plane and centerline.
1. Axial location of the filament or discharge arc centerline or the filament or discharge arc tolerance box relative to the bulb base reference plane.
2. Vertical location of the filament or discharge arc centerline or the filament or discharge arc tolerance box relative to the bulb base centerline.
3. Transverse location of the filament or discharge arc centerline or the filament or discharge arc tolerance box relative to the bulb base centerline.
4. Filament or discharge arc tolerance box dimensions, if used.
B. Upper beam filament or discharge arc dimensions or the filament or discharge arc tolerance box dimensions and relation of these to the bulb base reference plane and centerline.
1. Axial location of the filament or discharge arc centerline or the filament or discharge arc tolerance box relative to the bulb base reference plane.
2. Vertical location of the filament or discharge arc centerline or the filament or discharge arc tolerance box relative to the bulb base centerline.
3. Transverse location of the filament or discharge arc centerline or the filament or discharge arc tolerance box relative to the bulb base centerline.
4. Filament or discharge arc tolerance box dimensions, if used.
C. If the replaceable light source has both a lower beam and upper beam filament or discharge arc, the dimensional relationship between the two filament or discharge arc centerlines or the filament or discharge arc tolerance boxes may be provided instead of referencing the upper beam filament or discharge arc centerline or filament or discharge arc tolerance box to the bulb base centerline or reference plane.
D. For a light source using excited gas mixtures as a filament, necessary fiducial information and specifications including electrode position dimensions, and tolerance information that provide similar location and characteristics information required by paragraphs A, B, and C of this section I for light sources using a resistive type filament.
II. Bulb Base Interchangeability Dimensions and Tolerance

A. Angular locations, diameters, key/keyway sizes, and any other interchangeability dimensions for indexing the bulb base in the bulb holder.

B. Diameter, width, depth, and surface finish of seal groove, surface, or other pertinent sealing features.

C. Diameter of the bulb base at the interface of the base and its perpendicular reference surface.

D. Dimensions of features related to retention of the bulb base in the bulb holder such as tabs, keys, keyways, surface, etc.

III. Bulb Holder Interchangeability Dimensions and Tolerances

A. Mating angular locations, diameters, key/keyway sizes, any other interchangeability dimensions for indexing the bulb base in the bulb holder.

B. Mating diameter, width, depth, and surface, or other pertinent sealing features.

C. Mating diameter of the bulb holder at the interface of the bulb base aperture and its perpendicular reference surface.

D. Mating dimensions of features related to retention of the bulb base in the bulb holder such as tabs, keys, keyways, surface, or any other characteristics necessary for mating dimensions.

IV. Electrical Specifications for Each Light Source That Operates With a Ballast and Rated Life of the Light Source/Ballast Combination

A. Maximum power (in watts).

B. Luminous Flux (in lumens).

C. Rated laboratory life of the light source/ballast combination (not less than 2,000 hours).

V. Applicable to Light Sources That Operate With a Source Voltage Other Than 12.8 Volts Direct Current, and When a Proprietary Ballast Must Be Used With the Light Source

A. Manufacturer’s part number for the ballast.

B. Any other characteristics necessary for system operation.

VII. All Other Identification, Dimensions or Performance Specifications Necessary for Replaceability or Systems Test Not Listed in Sections I Through VI

APPENDIX C TO PART 564—INFORMATION APPLICABLE TO STANDARDIZED SEALED BEAM HEADLAMP UNITS

I. Dimensional Information Specific to a Type of Standardized Sealed Beam Unit.

A. Dimensions marked “I,” indicating interchangeability, for which conformance is mandatory.

B. All other dimensions which are for design purposes.

II. Dimensional Information Applicable to the Use of Nonadjustable Headlamp Aiming Device Locating Plates

III. Dimensional Information Applicable to Mounting Features, Including Mounting Rings and Lamp Bodies, Specific to a Type of Standardized Sealed Beam Unit

A. Dimensions marked “I,” indicating interchangeability, for which conformance is mandatory.

B. All other dimensions which are for design purposes.

PART 565—VEHICLE IDENTIFICATION NUMBER REQUIREMENTS (Eff. until 10–27–08)

§ 565.1 Purpose and scope.

This part specifies the format, content and physical requirements for a vehicle identification number (VIN) system and its installation to simplify vehicle identification information retrieval and to increase the accuracy and efficiency of vehicle recall campaigns.

§ 565.2 Applicability.

This part applies to passenger cars, multipurpose passenger vehicles, trucks, buses, trailers (including trailer kits), incomplete vehicles, and motorcycles. Vehicles imported into the United States under 49 CFR 591.5(f), other than by the corporation responsible for the assembly of that vehicle or a subsidiary of such a corporation, are excluded from requirements of § 565.4(b), § 565.4(c), § 565.4(g), § 565.4(h), § 565.5 and § 565.6.

§ 565.3 Definitions.

(a) Federal Motor Vehicle Safety Standards Definitions. Unless otherwise indicated, all terms used in this part that are defined in 49 CFR 571.3 are used as defined in 49 CFR 571.3.

(b) Body type means the general configuration or shape of a vehicle distinguished by such characteristics as the number of doors or windows, cargo-carrying features and the roofline (e.g., sedan, fastback, hatchback).

(c) Check digit means a single number or the letter X used to verify the accuracy of the transcription of the vehicle identification number.

(d) Engine type means a power source with defined characteristics such as fuel utilized, number of cylinders, displacement, and net brake horsepower. The specific manufacturer and make shall be represented if the engine powers a passenger car or a multipurpose passenger vehicle, or truck with a gross vehicle weight rating of 4536 kg. (10,000 lbs.) or less.

(e) Incomplete vehicle means an assemblage consisting, as a minimum, of frame and chassis structure, power train, steering system, suspension system and braking system, to the extent that those systems are to be part of the completed vehicle, that requires further manufacturing operations, other than the addition of readily attachable components, such as mirrors or tire and rim assemblies, or minor finishing operations such as painting, to become a completed vehicle.

(f) Line means a name that a manufacturer applies to a family of vehicles within a make which have a degree of commonality in construction, such as body, chassis or cab type.

(g) Make means a name that a manufacturer applies to a group of vehicles or engines.

(h) Manufacturer means a person—

(1) Manufacturing or assembling motor vehicles or motor vehicle equipment; or

(2) Importing motor vehicles or motor vehicle equipment for resale.

(i) Model means a name that a manufacturer applies to a family of vehicles of the same type, make, line, series and body type.

(j) Model Year means the year used to designate a discrete vehicle model, irrespective of the calendar year in
which the vehicle was actually produced, provided that the production period does not exceed 24 months.

(k) Plant of manufacture means the plant where the manufacturer affixes the VIN.

(l) Series means a name that a manufacturer applies to a subdivision of a “line” denoting price, size or weight identification and that is used by the manufacturer for marketing purposes.

(m) Trailer kit means a trailer that is fabricated and delivered in complete but unassembled form and that is designed to be assembled without special machinery or tools.

(n) Type means a class of vehicle distinguished by common traits, including design and purpose. Passenger cars, multipurpose passenger vehicles, trucks, buses, incomplete vehicles and motorcycles are separate types.

(o) VIN means a series of Arabic numbers and Roman letters that is assigned to a motor vehicle for identification purposes.

[61 FR 29033, June 7, 1996, as amended at 70 FR 23939, May 6, 2005]

§ 565.4 General requirements.

(a) Each vehicle manufactured in one stage shall have a VIN that is assigned by the manufacturer. Each vehicle manufactured in more than one stage shall have a VIN assigned by the incomplete vehicle manufacturer. Vehicle alterers, as specified in 49 CFR 567.7, shall utilize the VIN assigned by the original manufacturer of the vehicle.

(b) Each VIN shall consist of seventeen (17) characters.

(c) A check digit shall be part of each VIN. The check digit shall appear in position nine (9) of the VIN, on the vehicle and on any transfer documents containing the VIN prepared by the manufacturer to be given to the first owner for purposes other than resale.

(d) The VINs of any two vehicles manufactured within a 30-year period shall not be identical.

(e) The VIN of each vehicle shall appear clearly and indelibly upon either a part of the vehicle, other than the glazing, that is not designed to be removed except for repair or upon a separate plate or label that is permanently affixed to such a part.

(f) The VIN for passenger cars, multipurpose passenger vehicles and trucks of 4536 kg or less GVWR shall be located inside the passenger compartment. It shall be readable, without moving any part of the vehicle, through the vehicle glazing under daylight lighting conditions by an observer having 20/20 vision (Snellen) whose eye-point is located outside the vehicle adjacent to the left windshield pillar. Each character in the VIN subject to this paragraph shall have a minimum height of 4 mm.

(g) Each character in each VIN shall be one of the letters in the set: [ABCDEFGHJKLMNPRSTUVWXYZ] or a numeral in the set: [0123456789] assigned according to the method given in §565.5.

(h) All spaces provided for in the VIN must be occupied by a character specified in paragraph (g) of this section.

(i) The type face utilized for each VIN shall consist of capital, sanserif characters.

§ 565.5 Motor vehicles imported into the United States.

(a) Importers shall utilize the VIN assigned by the original manufacturer of the motor vehicle.

(b) A passenger car certified by a Registered Importer under 49 CFR part 592 shall have a plate or label that contains the following statement, in characters with a minimum height of 4 mm, with the identification number assigned by the original manufacturer provided in the blank: SUBSTITUTE FOR U.S. VIN: SEE PART 565. The plate or label shall conform to §565.4 (h) and (i). The plate or label shall be permanently affixed inside the passenger compartment. The plate or label shall be readable, without moving any part of the vehicle, through the vehicle glazing under daylight lighting conditions by an observer having 20/20 vision (Snellen) whose eye-point is located outside the vehicle adjacent to the left windshield pillar. It shall be located in such a manner as not to cover, obscure, or overlay any part of any identification number affixed by the original manufacturer. Passenger cars conforming to Canadian Motor Vehicle
§ 565.6 Content requirements.

The VIN shall consist of four sections of characters which shall be grouped accordingly:

(a) The first section shall consist of three characters that occupy positions one through three (1–3) in the VIN. This section shall uniquely identify the manufacturer, make and type of the motor vehicle if its manufacturer produces 500 or more motor vehicles of its type annually. If the manufacturer produces less than 500 motor vehicles of its type annually, these characters along with the third, fourth and fifth characters of the fourth section shall uniquely identify the manufacturer, make and type of the motor vehicle. These characters are assigned in accordance with § 565.7(a).

(b) The second section shall consist of five characters, which occupy positions four through eight (4–8) in the VIN. This section shall uniquely identify the attributes of the vehicle as specified in Table I. For passenger cars, and for multipurpose passenger vehicles and trucks with a gross vehicle weight rating of 4536 kg. (10,000 lbs.) or less, the first and second characters shall be alphabetic and the third and fourth characters shall be numeric. The fifth character may be either alphabetic or numeric. The characters utilized and their placement within the section may be determined by the manufacturer, but the specified attributes must be decipherable with information supplied by the manufacturer in accordance with § 565.7(c). In submitting the required information to NHTSA relating to gross vehicle weight rating, the designations in Table II shall be used. The use of these designations within the VIN itself is not required. Tables I and II follow:

Table I—Type of Vehicle and Information Decipherable

| Passenger car: Line, series, body type, engine type and restraint system type. |
| Multipurpose passenger vehicle: Line, series, body type, engine type, gross vehicle weight rating. |

Table II—Gross Vehicle Weight Rating Classes

| Class A—Not greater than 1360 kg. (3,000 lbs.) |
| Class B—Greater than 1360 kg. to 1814 kg. (3,001–4,000 lbs.) |
| Class C—Greater than 1814 kg. to 2268 kg. (4,001–5,000 lbs.) |
| Class D—Greater than 2268 kg. to 2722 kg. (5,001–6,000 lbs.) |
| Class E—Greater than 2722 kg. to 3175 kg. (6,001–7,000 lbs.) |
| Class F—Greater than 3175 kg. to 3629 kg. (7,001–8,000 lbs.) |
| Class G—Greater than 3629 kg. to 4082 kg. (8,001–9,000 lbs.) |
| Class H—Greater than 4082 kg. to 4536 kg. (9,001–10,000 lbs.) |
| Class 3—Greater than 4536 kg. to 6350 kg. (10,001–14,000 lbs.) |
| Class 4—Greater than 6350 kg. to 7257 kg. (14,001–16,000 lbs.) |
| Class 5—Greater than 7257 kg. to 8845 kg. (16,001–19,500 lbs.) |
| Class 6—Greater than 8845 kg. to 11793 kg. (19,501–26,000 lbs.) |
| Class 7—Greater than 11793 kg. to 14968 kg. (26,001–33,000 lbs.) |
| Class 8—Greater than 14968 kg. (33,001 lbs. and over) |

(c) The third section shall consist of one character, which occupies position nine (9) in the VIN. This section shall be the check digit whose purpose is to provide a means for verifying the accuracy of any VIN transcription. After all
other characters in VIN have been determined by the manufacturer, the check digit shall be calculated by carrying out the mathematical computation specified in paragraphs (c) (1) through (4) of this section.

(1) Assign to each character in the VIN its actual mathematical value and assign to each letter the value specified for it in Table III, as follows:

**Table III—Assigned Values**

<table>
<thead>
<tr>
<th>Character</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>1</td>
</tr>
<tr>
<td>B</td>
<td>2</td>

</tr>
</tbody>
</table>

(3) Add the resulting products and divide the total by 11.

(4) The numerical remainder is the check digit. If the remainder is 10 the letter "X" shall be used to designate the check digit. The correct numeric remainder, zero through nine (0-9) or the letter "X," shall appear in VIN position nine (9).

(5) A sample check digit calculation is shown in Table V as follows:

**Table V—Calculation of a Check Digit**

| VIN Position | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 | 13 | 14 | 15 | 16 | 17 |
|--------------|---|---|---|---|---|---|---|---|---|----|----|----|----|----|----|----|
| Sample VIN   | 1 | G | 4 | A | H | 5 | 9 | H | ... | 5 | G | 1 | 1 | 8 | 3 | 4 | 1 |
| Assigned Value| 1 | 7 | 4 | 1 | 8 | 5 | 9 | 8 | ... | 5 | 7 | 1 | 1 | 8 | 3 | 4 | 1 |
| Weight Factor| 8 | 7 | 6 | 5 | 4 | 3 | 2 | 10| 0 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 |
| Multiply Assigned value times weight factor | 8 | 49| 42| 35| 32| 24| 18| 15| 18| 80| 0  | 45| 56| 7  | 6 | 40| 12| 12|
| Add products: 8+49+42+35+32+24+18+15+18+80+0+45+56+7+6+40+12+12+2 = 411 |
| Divide by 11: 411/11 = 37 4/11 |

The remainder is 4; this is the check digit to be inserted in position nine (9) of the VIN.

(d) The fourth section shall consist of eight characters, which occupy positions ten through seventeen (10-17) of the VIN. The last five (5) characters of this section shall be numeric for passenger cars and for multipurpose passenger vehicles and trucks with a gross vehicle weight rating of 4536 kg. (10,000 lbs.) or less, and the last four (4) characters shall be numeric for all other vehicles.

(1) The first character of the fourth section shall represent the vehicle model year. The year shall be designated as indicated in Table VI as follows:

**Table VI—Year Codes for VIN**

<table>
<thead>
<tr>
<th>Year</th>
<th>Code</th>

</table>
§ 565.7 Reporting requirements.

The information collection requirements contained in this part have been approved by the Office of Management and Budget under the provisions of the Paperwork Reduction Act (44 U.S.C. 3501 et seq.) and have been assigned OMB Control Number 2127-0510.

(a) The National Highway Traffic Safety Administration (NHTSA) has contracted with the Society of Automotive Engineers (SAE) to coordinate the assignment of manufacturer identifiers. Manufacturer identifiers will be supplied by SAE at no charge. All requests for assignments of manufacturer identifiers should be forwarded directly to: Society of Automotive Engineers, 400 Commonwealth Avenue, Warrendale, Pennsylvania 15096, Attention: WMI Coordinator. Any requests for identifiers submitted to NHTSA will be forwarded to SAE. Manufacturers may request a specific identifier or may request only assignment of an identifier(s). SAE will review requests for specific identifiers to determine that they do not conflict with an identifier already assigned or block of identifiers already reserved. SAE will confirm the assignments in writing to the requester. Once confirmed by SAE, the identifier need not be resubmitted to NHTSA.

(b) Manufacturers of vehicles subject to this part shall submit, either directly or through an agent, the unique identifier for each make and type of vehicle it manufactures at least 60 days before affixing the first VIN using the identifier. Manufacturers whose unique identifier appears in the fourth section of the VIN shall also submit the three characters of the first section that constitutes a part of their identifier.

(c) Manufacturers of vehicles subject to the requirements of this part shall submit to NHTSA the information necessary to decipher the characters contained in its VINs. Amendments to this information shall be submitted to the agency for VINs containing an amended coding. The agency will not routinely provide written approvals of these submissions, but will contact the manufacturer should any corrections to these submissions be necessary.

(d) The information required under paragraph (c) of this section shall be submitted at least 60 days prior to offering for sale the first vehicle identified by a VIN containing the information, or if information concerning vehicle characteristics sufficient to specify the VIN code is unavailable to the manufacturer by that date, then within one week after that information first becomes available. The information shall be addressed to: Administrator, National Highway Traffic Safety Administration, 400 Seventh Street, SW., Washington, DC 20590, Attention: VIN Coordinator.

**Effective Date Note:** At 73 FR 23379, Apr. 30, 2008, part 565 was revised, effective Oct.
PART 565—VEHICLE IDENTIFICATION NUMBER (VIN) REQUIREMENTS

Subpart A—General Applicability of Subparts

Sec. 565.1 Purpose and scope.
565.2 Application.

Subpart B—VIN Requirements

Sec. 565.10 Purpose and scope.
565.11 Applicability.
565.12 Definitions.
565.13 General requirements.
565.15 Content requirements.
565.16 Reporting requirements.

Subpart C—Alternative VIN Requirements In Effect for Limited Period

Sec. 565.20 Purpose and scope.
565.21 Applicability.
565.22 Definitions.
565.23 General requirements.
565.24 Motor vehicles imported into the United States.
565.25 Content requirements.
565.26 Reporting requirements.

Subpart A—General Applicability of Subparts

§ 565.1 Purpose and scope.

This part specifies the format, content and physical requirements for a vehicle identification number (VIN) system and its installation to simplify vehicle identification information retrieval and to increase the accuracy and efficiency of vehicle recall campaigns.

§ 565.2 Application.

(a)(1) Except as provided in paragraph (a)(2) of this section, Subpart B of this part 565 applies to passenger cars, multipurpose passenger vehicles, trucks, buses, trailers (including trailer kits), incomplete vehicles, low speed vehicles, and motorcycles manufactured on or after October 27, 2008 whose VINs have a letter “A” or “B” in the 10th position, and to passenger cars, multipurpose passenger vehicles, trucks, buses, trailers (including trailer kits), incomplete vehicles, low speed vehicles, and motorcycles manufactured on or after April 30, 2009. Vehicles imported into the United States under 49 CFR 591.5(f), other than by the corporation responsible for the assembly of that vehicle or a subsidiary of such a corporation, are excluded from requirements of §§ 565.13(b), 565.13(c), 565.13(g), 565.13(h), 565.14 and 565.15.

(b) All motor vehicles identified as model year 2009 or earlier vehicles by their manufacturer must comply with Subpart C of this part 565.

Subpart B—VIN Requirements

§ 565.10 Purpose and scope.

This part specifies the format, content and physical requirements for a vehicle identification number (VIN) system and its installation to simplify vehicle identification information retrieval and to increase the accuracy and efficiency of vehicle recall campaigns.

§ 565.11 Applicability.

See subpart A of this part 565 regarding the general applicability of this subpart. This part applies to passenger cars, multipurpose passenger vehicles, trucks, buses, trailers (including trailer kits), incomplete vehicles, low speed vehicles, and motorcycles manufactured on or after October 27, 2008 whose VINs have a letter “A” or “B” in the 10th position, and to passenger cars, multipurpose passenger vehicles, trucks, buses, trailers (including trailer kits), incomplete vehicles, low speed vehicles, and motorcycles manufactured on or after April 30, 2009 that are not identified by their manufacturer as model year 2009 or earlier vehicles. Vehicles imported into the United States under 49 CFR 591.5(f), other than by the corporation responsible for the assembly of that vehicle or a subsidiary of such a corporation, are excluded from requirements of §§ 565.13(b), 565.13(c), 565.13(g), 565.13(h), 565.14 and 565.15.

§ 565.12 Definitions.

(a) Federal Motor Vehicle Safety Standards Definitions. Unless otherwise indicated, all terms used in this part that are defined in 49 CFR 571.3 are used as defined in 49 CFR 571.3.

(b) Body type means the general configuration or shape of a vehicle distinguished by such characteristics as the number of doors or windows, cargo-carrying features and the roofline (e.g., sedan, fastback, hatchback).

(c) Check digit means a single number or the letter X used to verify the accuracy of
the transcription of the vehicle identification number.

(d) Engine type means a power source with defined characteristics such as fuel utilized, number of cylinders, displacement, and net brake horsepower. The specific manufacturer and make shall be represented if the engine powers a passenger car or a multipurpose passenger vehicle, or truck with a gross vehicle weight rating of 4536 kg (10,000 lb) or less.

(e) High-volume manufacturer, for purposes of this part, means a manufacturer of 1,000 or more vehicles of a given type each year.

(f) Incomplete vehicle means an assemblage consisting, as a minimum, of frame and chassis structure, power train, steering system, suspension system and braking system, to the extent that those systems are to be part of the completed vehicle, that requires further manufacturing operations, other than the addition of readily attachable components, such as mirrors or tire and rim assemblies, or minor finishing operations such as painting, to become a completed vehicle.

(g) Line means a name that a manufacturer applies to a family of vehicles within a make which have a degree of commonality in construction, such as body, chassis or cab type.

(h) Low-volume manufacturer, for purposes of this part, means a manufacturer of fewer than 1,000 vehicles of a given type each year.

(i) Make means a name that a manufacturer applies to a group of vehicles or engines.

(j) Manufacturer means a person—

(1) Manufacturing or assembling motor vehicles or motor vehicle equipment; or

(2) Importing motor vehicles or motor vehicle equipment for resale.

(k) Manufacturer identifier means the first three digits of a VIN of a vehicle manufactured by a high-volume manufacturer, and the first three digits of a VIN of the vehicle through fourteenth digits of a VIN of a vehicle manufactured by a low-volume manufacturer.

(l) Model means a name that a manufacturer applies to a family of vehicles of the same type, make, line, series and body type.

(m) Model year means the year used to designate a discrete vehicle model, irrespective of the calendar year in which the vehicle was actually produced, provided that the production period does not exceed 24 months.

(n) Plant of manufacture means the plant where the manufacturer affixes the VIN.

(o) Series means a name that a manufacturer applies to a subdivision of a “line” denoting price, size or weight identification and that is used by the manufacturer for marketing purposes.

(p) Trailer kit means a trailer that is fabricated and delivered in complete but unassembled form and that is designed to be assembled without special machinery or tools.

(q) Type means a class of vehicle distinguished by common traits, including design and purpose. Passenger cars, multipurpose passenger vehicles, trucks, buses, trailers, incomplete vehicles, low speed vehicles, and motorcycles are separate types.

(r) VIN means a series of Arabic numbers and Roman letters that is assigned to a motor vehicle for identification purposes.

§565.13 General requirements.

(a) Each vehicle manufactured in one stage shall have a VIN that is assigned by the manufacturer. Each vehicle manufactured in more than one stage shall have a VIN assigned by the incomplete vehicle manufacturer. Vehicle alterers, as specified in 49 CFR 567.16, shall utilize the VIN assigned by the original manufacturer of the vehicle.

(b) Each VIN shall consist of seventeen (17) characters.

(c) A check digit shall be part of each VIN. The check digit shall appear in position nine (9) of the VIN, on the vehicle and on any transfer documents containing the VIN prepared by the manufacturer to be given to the first owner for purposes other than resale.

(d) The VINs of any two vehicles subject to the Federal motor vehicle safety standards and manufactured within a 60-year period beginning with the 1980 model year shall not be identical.

(e) The VIN of each vehicle shall appear clearly and indelibly upon either a part of the vehicle, other than the glazing, that is not designed to be removed except for repair or upon a separate plate or label that is permanently affixed to such a part.

(f) The VIN for passenger cars, multipurpose passenger vehicles, low speed vehicles, and trucks of 4536 kg or less GVWR shall be located inside the passenger compartment. It shall be readable, without moving any part of the vehicle, through the vehicle glazing under daylight lighting conditions by an observer having 20/20 vision (Snellen) whose eye-point is located outside the vehicle adjacent to the left windshield pillar. Each character in the VIN subject to this paragraph shall have a minimum height of 4 mm.

(g) Each character in each VIN shall be one of the letters in the set: [ABCDEFGHJKLMNPRSTUVWXYZ] or a numeral in the set: [0123456789] assigned according to the method given in §565.14.

(h) All spaces provided for in the VIN must be occupied by a character specified in paragraph (g) of this section.

(i) The type face utilized for each VIN shall consist of capital, sanserif characters.

(a) Importers shall utilize the VIN assigned by the original manufacturer of the motor vehicle.

(b) All passenger cars, multipurpose passenger vehicles, low speed vehicles and trucks of 4536 kg or less GVWR certified by
Pt. 565, NI.

a Registered Importer under 49 CFR part 592 whose VINs do not comply with part 565.13 and 565.14 shall have a plate or label that contains the following statement, in characters that have a minimum height of 4 mm and the identification number assigned by the vehicle’s original manufacturer inserted in the blank: SUBSTITUTE FOR U.S. VIN: SEE 49 CFR PART 565. The plate or label shall conform to §565.13 (b) and (i). The plate or label shall be permanently affixed inside the passenger compartment. The plate or label shall be readable, without moving any part of the vehicle, through the vehicle glazing under daylight conditions by an observer having 20/20 vision (Snellen) whose eye-point is located outside the vehicle adjacent to the left windshield pillar. It shall be located in such a manner as not to cover, obscure, or overlay any part of any identification number affixed by the original manufacturer. Motor vehicles conforming to Canada Motor Vehicle Safety Standard 115 are exempt from this paragraph.

§ 565.15 Content requirements.
(a) The first section shall consist of three characters that occupy positions one through three (1–3) in the VIN. This section shall uniquely identify the manufacturer and type of the motor vehicle if the manufacturer is a high-volume manufacturer. If the manufacturer is a low-volume manufacturer, positions one through three (1–3) along with positions twelve through fourteen (12–14) in the VIN shall uniquely identify the manufacturer and type of the motor vehicle. These characters are assigned in accordance with §565.16(a). A “9” shall be placed in the third position of the VIN if the manufacturer identifier is six characters. A “9” in the third position always indicates the presence of a six-character manufacturer identifier. The National Highway Traffic Safety Administration offers access to manufacturer identifier assignments via its search engine at the following Internet Web site: http://www.nhtsa.dot.gov/cars/rules/manufacture.
(b) The second section shall consist of five characters, which occupy positions four through eight (4–8) in the VIN. This section shall uniquely identify the attributes of the vehicle as specified in Table I. For passenger cars and for multipurpose passenger vehicles and trucks with a gross vehicle weight rating of 4536 kg (10,000 lb) or less, the fourth character (position 7) of this section shall be alphabetic. The characters utilized and their placement within the section may be determined by the manufacturer, but the specified attributes must be decipherable with information supplied by the manufacturer in accordance with §565.16(c). In submitting the required information to NHTSA relating gross vehicle weight rating, the designations in Table II shall be used. The use of these designations within the VIN itself is not required. Tables I and II follow:

<table>
<thead>
<tr>
<th>Table I—Type of Vehicle and Information Decipherable</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Passenger car:</strong> Make, line, series, body type, engine type, and all restraint devices and their location.</td>
</tr>
<tr>
<td><strong>Multipurpose passenger vehicle:</strong> Make, line, series, body type, engine type, gross vehicle weight rating, and for multipurpose passenger vehicles with a gross vehicle weight rating (GVWR) of 4536 kg (10,000 lb) or less all restraint devices and their location.</td>
</tr>
<tr>
<td><strong>Truck:</strong> Make, model or line, series, chassis, cab type, engine type, brake system, gross vehicle weight rating, and for trucks with a gross vehicle weight rating (GVWR) of 4536 kg (10,000 lb) or less all restraint devices and their location.</td>
</tr>
<tr>

(c) The third section shall consist of one character, which occupies position nine (9) in the VIN. This section shall be the check digit whose purpose is to provide a means for verifying the accuracy of any VIN transcription. After all other characters in VIN have been determined by the manufacturer, the check digit shall be calculated by carrying out the mathematical computation specified in paragraphs (c) (1) through (4) of this section.

(1) Assign to each number in the VIN its actual mathematical value and assign to each letter the value specified in Table III, as follows:

<table>
<thead>
<tr>
<th>Letter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>1</td>

</table>

Add products: 8+49+24+5+32+15+18+80+0+45+56+7+6+40+12+12+2 = 411.
Divide by 11: 411/11 = 37.4/11 or 37.3636.
If the fourth digit is 5 or greater, round up. If the fourth digit is 4 or smaller, round down.
In the example above, the remainder is 4/11 or 0.364 when rounded up.
Looking up the remainder in Table V—Ninth Position Check Digit Values indicates that “4” is the check digit to be inserted in position nine (9) of the VIN for this sample digit calculation.
(d) The fourth section shall consist of eight characters, which occupy positions ten through seventeen (10–17) of the VIN. The last five (5) characters of this section shall be numeric for passenger cars and for multipurpose passenger vehicles and trucks with a gross vehicle weight rating of 4,536 kg. (10,000 lbs.) or less, and the last four (4) characters shall be numeric for all other vehicles.

(1) The first character of the fourth section shall represent the vehicle model year. The year shall be designated as indicated in Table VII as follows:

<table>
<thead>
<tr>
<th>Year</th>
<th>Code</th>
</tr>

</table>

Note to Table VII: For passenger cars, and for multipurpose passenger vehicles and trucks with a gross vehicle weight rating of 4,536 kg (10,000 lbs.) or less, if position 7 is numeric, the Model Year in position 10 of the VIN refers to a year in the range 1980–2009. If position 7 is alphabetic, the Model Year in position 10 of the VIN refers to a year in the range 2010–2039.

(2) The second character of the fourth section shall represent the plant of manufacture.

(3) The third through the eighth characters of the fourth section (positions 12 through 17) shall represent the number sequentially assigned by the manufacturer in the production process if the manufacturer is a high-volume manufacturer. If a manufacturer is a low-volume manufacturer, the third, fourth, and fifth characters of the fourth section (positions 12, 13, and 14), combined with the three characters of the first section (positions 1, 2, and 3), shall uniquely identify the manufacturer and type of the motor vehicle and the sixth, seventh, and eighth characters of the fourth section (positions 16, 17) shall represent the number sequentially assigned by the manufacturer in the production process.

§565.16 Reporting requirements.

The information collection requirements contained in this part have been approved by the Office of Management and Budget under the provisions of the Paperwork Reduction Act (44 U.S.C. 3501 et seq.) and have been assigned OMB Control Number 2127-0510.

(a) The National Highway Traffic Safety Administration (NHTSA) has contracted with the SAE International to coordinate the assignment of manufacturer identifiers to manufacturers in the United States. Manufacturer identifiers will be supplied by SAE at no charge. All requests for assignments of manufacturer identifiers should be forwarded directly to: SAE International, 400 Commonwealth Drive, Warrendale, Pennsylvania, 15096. Attention: WMI Coordinator (telephone: 724–776–4841). Any requests for identifiers submitted to NHTSA will be forwarded to SAE. Manufacturers may request a specific identifier or may request only assignment of an identifier(s). SAE will review requests for specific identifiers to determine that they do not conflict with an identifier already assigned or block of identifiers already reserved. SAE will confirm the assignments in writing to the requester. Once confirmed by SAE, the identifier need not be resubmitted to NHTSA.

(b) Manufacturers of vehicles subject to this part shall submit, either directly or through an agent, the unique identifier for each make and type of vehicle it manufactures at least 60 days before affixing the first VIN using the identifier. Manufacturers whose unique identifier appears in the fourth section of the VIN shall also submit the three characters of the first section that constitutes a part of their identifier.

(c) Manufacturers of vehicles subject to the requirements of this part shall submit to NHTSA the information necessary to decipher the characters contained in its VINs. Amendments to this information shall be submitted to the agency for VINs containing an amended VIN. The agency will not routinely provide written approvals of these submissions, but will contact the manufacturer should any corrections to these submissions be necessary.

(d) The information required under paragraph (c) of this section shall be submitted at least 60 days prior to offering for sale the first vehicle identified by a VIN containing that information, or if information concerning vehicle characteristics sufficient to specify the VIN code is unavailable to the
Pt. 565, Nt.

manufacturer by that date, then within one week after that information first becomes available. The information shall be addressed to: Administrator, National Highway Traffic Safety Administration, 1200 New Jersey Avenue, SE, Washington, DC 20590, Attention: VIN Coordinator.

Subpart C—Alternative VIN Requirements In Effect for Limited Period

§ 565.20 Purpose and scope.

This part specifies the format, content and physical requirements for a vehicle identification number (VIN) system and its installation to simplify vehicle identification information retrieval and to increase the accuracy and efficiency of vehicle recall campaigns.

§ 565.21 Applicability.

See subpart A of this part 565 regarding the applicability of this subpart. This part applies to passenger cars, multipurpose passenger vehicles, trucks, buses, trailers (including trailer kits), incomplete vehicles, and motorcycles. Vehicles imported into the United States under 49 CFR 591.5(f), other than by the corporation responsible for the assembly of that vehicle or a subsidiary of such a corporation, are excluded from requirements of §§565.23(b), 565.23(c), 565.23(g), 565.23(h), 565.24 and 565.25.

§ 565.22 Definitions.

(a) Federal Motor Vehicle Safety Standards Definitions. Unless otherwise indicated, all terms used in this part that are defined in 49 CFR 571.3 are used as defined in 49 CFR 571.3.

(b) Body type means the general configuration or shape of a vehicle distinguished by such characteristics as the number of doors or windows, cargo-carrying features and the roofline (e.g., sedan, fastback, hatchback).

(c) Check digit means a single number or the letter X used to verify the accuracy of the transcription of the vehicle identification number.

(d) Engine type means a power source with defined characteristics such as fuel utilized, number of cylinders, displacement, and net brake horsepower. The specific manufacturer and make shall be represented if the engine powers a passenger car or a multipurpose passenger vehicle, or truck with a gross vehicle weight rating of 4536 kg. (10,000 lbs.) or less.

(e) Incomplete vehicle means an assemblage consisting, as a minimum, of frame and chassis structure, power train, steering system, suspension system and braking system, to the extent that those systems are to be part of the completed vehicle, that requires further manufacturing operations, other than the addition of readily attachable components, such as mirrors or tire and rim assemblies, or minor finishing operations such as painting, to become a completed vehicle.

(f) Line means a name that a manufacturer applies to a family of vehicles within a make which have a degree of commonality in construction, such as body, chassis or cab type.

(g) Make means a name that a manufacturer applies to a group of vehicles or engines.

(h) Manufacturer means a person—

(1) Manufacturing or assembling motor vehicles or motor vehicle equipment; or

(2) Importing motor vehicles or motor vehicle equipment for resale.

(i) Model means a name that a manufacturer applies to a family of vehicles of the same type, make, line, series and body type.

(j) Model Year means the year used to designate a discrete vehicle model, irrespective of the calendar year in which the vehicle was actually produced, provided that the production period does not exceed 24 months.

(k) Plant of manufacture means the plant where the manufacturer affixes the VIN.

(l) Series means a name that a manufacturer applies to a subdivision of a “line” denoting price, size or weight identification and that is used by the manufacturer for marketing purposes.

(m) Trailer kit means a trailer that is fabricated and delivered in complete but unassembled form and that is designed to be assembled without special machinery or tools.

(n) Type means a class of vehicle distinguished by common traits, including design and purpose. Passenger cars, multipurpose passenger vehicles, trucks, buses, trailers, incomplete vehicles and motorcycles are separate types.

(o) VIN means a series of Arabic numbers and Roman letters that is assigned to a motor vehicle for identification purposes.

§ 565.23 General requirements.

(a) Each vehicle manufactured in one stage shall have a VIN that is assigned by the manufacturer. Each vehicle manufactured in more than one stage shall have a VIN assigned by the incomplete vehicle manufacturer. Vehicle alters, as specified in 49 CFR 567.26, shall utilize the VIN assigned by the original manufacturer of the vehicle.

(b) Each VIN shall consist of seventeen (17) characters.

(c) A check digit shall be part of each VIN. The check digit shall appear in position nine (9) of the VIN, on the vehicle and on any transfer documents containing the VIN prepared by the manufacturer to be given to the first owner for purposes other than resale.

(d) The VINs of any two vehicles manufactured within a 30-year period shall not be identical.

(e) The VIN of each vehicle shall appear clearly and indelibly upon either a part of the vehicle, other than the glazing, that is not designed to be removed except for repair...
or upon a separate plate or label that is permanently affixed to such a part.

(f) The VIN for passenger cars, multipurpose passenger vehicles and trucks of 4536 kg or less GVWR shall be located inside the passenger compartment. It shall be readable, without moving any part of the vehicle, through the vehicle glazing under daylight lighting conditions by an observer having 20/20 vision (Snellen) whose eye-point is located outside the vehicle adjacent to the left windshield pillar. Each character in the VIN subject to this paragraph shall have a minimum height of 4 mm.

(g) Each character in each VIN shall be one of the letters in the set: [ABCDEFGHJKLMNPRSTUVWXYZ] or a numeral in the set: [0123456789] assigned according to the method given in §565.24.

(h) All spaces provided for in the VIN must be occupied by a character specified in paragraph (g) of this section.

(i) The type face utilized for each VIN shall consist of capital, sanserif characters.

§565.24 Motor vehicles imported into the United States.

(a) Importers shall utilize the VIN assigned by the original manufacturer of the motor vehicle.

(b) A passenger car certified by a Registered Importer under 49 CFR part 592 shall have a plate or label that contains the following statement, in characters with a minimum height of 4 mm, with the identification number assigned by the original manufacturer provided in the blank: SUBSTITUTE FOR U.S. VIN: lll SEE PART 565. The plate or label shall conform to §565.23 (h) and (i). The plate or label shall be readable, without moving any part of the vehicle, through the vehicle glazing under daylight lighting conditions by an observer having 20/20 vision (Snellen) whose eye-point is located outside the vehicle adjacent to the left windshield pillar. It shall be located in such a manner as not to cover, obscure, or overlay any part of any identification number affixed by the original manufacturer. Passenger cars conforming to Canadian Motor Vehicle Safety Standard 115 are exempt from this paragraph.

§565.25 Content requirements.

The VIN shall consist of four sections of characters which shall be grouped accordingly:

(a) The first section shall consist of three characters that occupy positions one through three (1–3) in the VIN. This section shall uniquely identify the manufacturer, make and type of the motor vehicle if its manufacturer produces 500 or more motor vehicles of its type annually. If the manufacturer produces less than 500 motor vehicles of its type annually, these characters along with the third, fourth and fifth characters of the fourth section shall uniquely identify the manufacturer, make and type of the motor vehicle. These characters are assigned in accordance with §565.26(a).

(b) The second section shall consist of five characters, which occupy positions four through eight (4–8) in the VIN. This section shall uniquely identify the attributes of the vehicle as specified in Table VIII. For passenger cars, and for multipurpose passenger vehicles and trucks with a gross vehicle weight rating of 4536 kg (10,000 lb) or less, the first and second characters shall be alphabetic and the third and fourth characters shall be numeric. The fifth character may be either alphabetic or numeric. The characters utilized and their placement within the section may be determined by the manufacturer, but the specified attributes must be decipherable with information supplied by the manufacturer in accordance with §565.26(c). In submitting the required information to NHTSA relating to gross vehicle weight rating, the designations in Table IX shall be used. The use of these designations within the VIN itself is not required. Tables VIII and IX follow:

<table>
<thead>
<tr>
<th>TABLE VIII—TYPE OF VEHICLE AND INFORMATION DECIPHERABLE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Passenger car: Line, series, body type, engine type and restraint system type.</td>
</tr>
<tr>
<td>Multipurpose passenger vehicle: Line, series, body type, engine type, gross vehicle weight rating.</td>
</tr>
<tr>
<td>Truck: Model or line, series, chassis, cab type, engine type, brake system and gross vehicle weight rating.</td>
</tr>
<tr>
<td>Bus: Model or line, series, body type, engine type, and brake system.</td>
</tr>
<tr>
<td>Trailer, including trailer kits and incomplete trailer: Type of trailer, body type, length and axle configuration.</td>
</tr>
<tr>
<td>Motorcycle: Type of motorcycle, line, engine type, and net brake horsepower.</td>
</tr>
</tbody>
</table>
Incomplete Vehicle other than a trailer: Model or line, series, cab type, engine type and brake system.

Note to Table VIII: Engine net brake horsepower when encoded in the VIN shall differ by no more than 10 percent from the actual net brake horsepower; shall in the case of motorcycle with an actual net brake horsepower of 2 or less, be not more than 2; and shall be greater than 2 in the case of a motorcycle with an actual brake horsepower greater than 2.

### Table VIII—Type of Vehicle and Information Decipherable—Continued

CLASS

| Incomplete Vehicle other than a trailer: Model or line, series, cab type, engine type and brake system. |

### Table IX—Gross Vehicle Weight Rating Classes

| Class A | Not greater than 1360 kg. (3,000 lbs.) |
| Class B | Greater than 1360 kg. to 1814 kg. (3,001–4,000 lbs.) |
| Class C | Greater than 1814 kg. to 2268 kg. (4,001–5,000 lbs.) |
| Class D | Greater than 2268 kg. to 2722 kg. (5,001–6,000 lbs.) |
| Class E | Greater than 2722 kg. to 3175 kg. (6,001–7,000 lbs.) |
| Class F | Greater than 3175 kg. to 3629 kg. (7,001–8,000 lbs.) |
| Class G | Greater than 3629 kg. to 4082 kg. (8,001–9,000 lbs.) |
| Class H | Greater than 4082 kg. to 4536 kg. (9,001–10,000 lbs.) |
| Class 3 | Greater than 4536 kg. to 6350 kg. (10,001–14,000 lbs.) |
| Class 4 | Greater than 6350 kg. to 7257 kg. (14,001–16,000 lbs.) |
| Class 5 | Greater than 7257 kg. to 8845 kg. (16,001–19,500 lbs.) |
| Class 6 | Greater than 8845 kg. to 11793 kg. (19,501–26,000 lbs.) |
| Class 7 | Greater than 11793 kg. to 14968 kg. (26,001–33,000 lbs.) |
| Class 8 | Greater than 14968 kg. (33,001 lbs. and over). |

(c) The third section shall consist of one character, which occupies position nine (9) in the VIN. This section shall be the check digit whose purpose is to provide a means for verifying the accuracy of any VIN transcription. After all other characters in VIN have been determined by the manufacturer, the check digit shall be calculated by carrying out the mathematical computation specified in paragraphs (c) (1) through (4) of this section.

(1) Assign to each number in the VIN its actual mathematical value and assign to each letter the value specified for it in Table X, as follows:

### Table X—Assigned Values

<table>
<thead>
<tr>
<th>Character</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>1</td>
</tr>
<tr>
<td>B</td>
<td>2</td>
</tr>
<tr>
<td>C</td>
<td>3</td>
</tr>
</tbody>
</table>

(2) Multiply the assigned value for each character in the VIN by the position weight factor specified in Table XI, as follows:

### Table XI—VIN Position and Weight Factor

<table>
<thead>
<tr>
<th>Position</th>
<th>Weight Factor</th>
</tr>
</thead>
<tbody>
<tr>
<td>1st</td>

(2) The second character of the fourth section shall represent the plant of manufacturer.

(3) The third through the eighth characters of the fourth section shall represent the number sequentially assigned by the manufacturer in the production process if the manufacturer produces 500 or more vehicles of its type annually. If the manufacturer produces less than 500 motor vehicles of its type annually, the third, fourth and fifth characters of the fourth section, combined with the three characters of the first section, shall uniquely identify the manufacturer, make and type of the motor vehicle and the sixth, seventh, and eighth characters of the fourth section shall represent the number sequentially assigned by the manufacturer in the production process.

§ 565.26 Reporting requirements.

The information collection requirements contained in this part have been approved by the Office of Management and Budget under the provisions of the Paperwork Reduction Act (44 U.S.C. 3501 et seq.) and have been assigned OMB Control Number 2127–0510.

(a) The National Highway Traffic Safety Administration (NHTSA) has contracted with the SAE International (SAE) to coordinate the assignment of manufacturer identifiers. Manufacturer identifiers will be supplied by SAE at no charge. All requests for assignments of manufacturer identifiers should be forwarded directly to: SAE International, 400 Commonwealth Drive, Warrendale, Pennsylvania 15096, Attention: WMI Coordinator. Any requests for identifiers submitted to NHTSA will be forwarded to SAE. Manufacturers may request a specific identifier or may request only assignment of an identifier(s). SAE will review requests for specific identifiers to determine that they do not conflict with an identifier already assigned or block of identifiers already reserved. SAE will confirm the assignments in writing to the requester. Once confirmed by SAE, the identifier need not be re-submitted to NHTSA.

(b) Manufacturers of vehicles subject to this part shall submit, either directly or through an agent, the unique identifier for each make and type of vehicle it manufactures at least 60 days before affixing the first VIN using the identifier. Manufacturers whose unique identifier appears in the fourth section of the VIN shall also submit the three characters of the first section that constitutes a part of their identifier.

(c) Manufacturers of vehicles subject to the requirements of this part shall submit to NHTSA the information necessary to decipher the characters contained in its VINS. Amendments to this information shall be submitted to the agency for VINS containing an amended coding. The agency will not routinely provide written approvals of these submissions, but will contact the manufacturer should any corrections to these submissions be necessary.

(d) The information required under paragraph (c) of this section shall be submitted at least 60 days prior to offering for sale the first vehicle identified by a VIN containing that information, or if information concerning vehicle characteristics sufficient to specify the VIN code is unavailable to the manufacturer by that date, then within one week after that information first becomes available. The information shall be addressed to: Administrator, National Highway Traffic Safety Administration, 1200 New Jersey Avenue, SE., Washington, DC 20590, Attention: VIN Coordinator.
PART 566—MANUFACTURER IDENTIFICATION

Sec. 566.1 Scope.
566.2 Purpose.
566.3 Application.
566.4 Definitions.
566.5 Requirements.
566.6 Submittal of information.

§ 566.1 Scope.
This part requires manufacturers of motor vehicles, and of motor vehicle equipment to which a motor vehicle safety standard applies, to submit identifying information and a description of the items they produce.

[36 FR 20978, Nov. 2, 1971]

§ 566.2 Purpose.
The purpose of this part is to facilitate the regulation of manufacturers under the National Traffic and Motor Vehicle Safety Act, and to aid in establishing a code numbering system for all regulated manufacturers.

[36 FR 20978, Nov. 2, 1971]

§ 566.3 Application.
This part applies to all manufacturers of motor vehicles, and to manufacturers of motor vehicle equipment, other than tires, to which a motor vehicle safety standard applies (hereafter referred to as “covered equipment”).

[36 FR 20978, Nov. 2, 1971]

§ 566.4 Definitions.
All terms defined in the Act and the rules and standards issued under its authority are used as defined therein. Specifically, incomplete vehicle, intermediate manufacturer, and final-stage manufacturer are used as defined in Part 568—Vehicles Manufactured in Two or More Stages.

(Authority: 15 U.S.C. 1392, 1397)
[37 FR 1364, Jan. 28, 1972]

§ 566.5 Requirements.
Each manufacturer of motor vehicles, and each manufacturer of covered equipment, shall furnish the information specified in paragraphs (a) through (c) of this section to: Administrator, National Highway Traffic Safety Administration, 400 Seventh Street SW., Washington, DC 20590.

(a) Full individual, partnership, or corporate name of the manufacturer.

(b) Residence address of the manufacturer and State of incorporation if applicable.

(c) Description of each type of motor vehicle or of covered equipment manufactured by the manufacturer, including, for motor vehicles, the approximate ranges of gross vehicle weight ratings for each type.

(1) Except as noted below, the description may be of general types, such as “passenger cars” or “brake fluid.”

(2) In the case of multipurpose passenger vehicles, trucks, and trailers, the description shall be specific enough also to indicate the types of use for which the vehicles are intended, such as “tank trailer,” “motor home,” or “cargo van.”

(3) In the case of motor vehicles produced in two or more stages, if the manufacturer is an incomplete vehicle manufacturer, the description shall so state and include a description indicating the stage of completion of the vehicle and, where known, the types of use for which the vehicle is intended.

Example: “Incomplete vehicle manufacturer—Chassis-cab intended for completion as van-type truck.”

If the manufacturer is an intermediate manufacturer, or a final stage manufacturer, the description shall so state and include a brief description of the work performed.

Example: “Multipurpose passenger vehicles: Motor homes with GVWR from 8,000 to 12,000 pounds. Final-stage manufacturer—add body to bare chassis.”

(15 U.S.C. 1392, 1397)

§ 566.6 Submittal of information.
Each manufacturer required to submit information under §566.5 shall submit the information not later than February 1, 1972. After that date, each person who begins to manufacture a
type of motor vehicle or covered equipment for which he has not submitted the required information shall submit the information specified in paragraphs (a) through (c) of §566.5 not later than 30 days after he begins manufacture. Each manufacturer who has submitted required information shall keep his entry current, accurate and complete by submitting revised information not later than 30 days after the relevant changes in his business occur.

PART 567—CERTIFICATION

§ 567.3 Definitions.

Addendum means the document described in §568.5 of this chapter.

Altered vehicle means a completed vehicle previously certified in accordance with §567.4 or §567.5 that has been altered other than by the addition, substitution, or removal of readily attachable components, such as mirrors or tire and rim assemblies, or by minor finishing operations such as painting, before the first purchase of the vehicle other than for resale, in such a manner as may affect the conformity of the vehicle with one or more Federal Motor Vehicle Safety Standard(s) or the validity of the vehicle’s stated weight ratings or vehicle type classification.

Alterer means a person who alters by addition, substitution, or removal of components (other than readily attachable components) a certified vehicle before the first purchase of the vehicle other than for resale.

Chassis-cab means an incomplete vehicle, with a completed occupant compartment, that requires only the addition of cargo-carrying, work-performing, or load-bearing components to perform its intended function.

Completed vehicle means a vehicle that requires no further manufacturing operations to perform its intended function.
Final-stage manufacturer means a person who performs such manufacturing operations on an incomplete vehicle that it becomes a completed vehicle.

Incomplete trailer means a vehicle that is capable of being drawn and that consists, at a minimum, of a chassis (including the frame) structure and suspension system but needs further manufacturing operations performed on it to become a completed vehicle.

Incomplete vehicle means

(1) An assemblage consisting, at a minimum, of a chassis (including the frame) structure, power train, steering system, suspension system, and braking system, in the state that those systems are to be part of the completed vehicle, but requires further manufacturing operations to become a completed vehicle; or

(2) An incomplete trailer.

Incomplete vehicle document or IVD means the document described in 49 CFR 568.4(a) and (b).

Incomplete vehicle manufacturer means a person who manufactures an incomplete vehicle by assembling components none of which, taken separately, constitute an incomplete vehicle.

Intermediate manufacturer means a person, other than the incomplete vehicle manufacturer or the final-stage manufacturer, who performs manufacturing operations on a vehicle manufactured in two or more stages.

§ 567.4 Requirements for manufacturers of motor vehicles.

(a) Each manufacturer of motor vehicles (except vehicles manufactured in two or more stages) shall affix to each vehicle a label, of the type and in the manner described below, containing the statements specified in paragraph (g) of this section.

(b) The label shall be riveted or permanently affixed in such a manner that it cannot be removed without destroying or defacing it.

(c) Except for trailers and motorcycles, the label shall be affixed to either the hinge pillar, door-latch post, or the door edge that meets the door-latch post, next to the driver’s seating position, or if none of these locations is practicable, to the left side of the instrument panel. If that location is also not practicable, the label shall be affixed to the inward-facing surface of the door next to the driver’s seating position. If none of the preceding locations is practicable, notification of that fact, together with drawings or photographs showing a suggested alternate location in the same general area, shall be submitted for approval to the Administrator, National Highway Traffic Safety Administration, Washington, D.C. 20590. The location of the label shall be such that it is easily readable without moving any part of the vehicle except an outer door.

(d) The label for trailers shall be affixed to a location on the forward half of the left side, such that it is easily readable from outside the vehicle without moving any part of the vehicle.

(e) The label for motorcycles shall be affixed to a permanent member of the vehicle as close as is practicable to the intersection of the steering post with the handle bars, in a location such that it is easily readable without moving any part of the vehicle except the steering system.

(f) The lettering on the label shall be of a color that contrasts with the background of the label.

(g) The label shall contain the following statements, in the English language, lettered in block capitals and numerals not less than three thirtyseconds of an inch high, in the order shown:

(1) Name of manufacturer: Except as provided in paragraphs (g)(1)(i), (ii) and (iii) of this section, the full corporate or individual name of the actual assembler of the vehicle shall be spelled out, except that such abbreviations as “Co.” or “Inc.” and their foreign equivalents, and the first and middle initials of individuals, may be used. The name of the manufacturer shall be preceded by the words “Manufactured By” or “Mfd By.” In the case of imported vehicles to which the label required by this section is affixed by the Registered Importer, the name of the Registered Importer shall also be placed on the label in the manner described in this paragraph, directly below the name of the actual assembler.

(i) If a vehicle is assembled by a corporation that is controlled by another
corporation that assumes responsibility for conformity with the standards, the name of the controlling corporation may be used.

(ii) If a vehicle is fabricated and delivered in complete but unassembled form, such that it is designed to be assembled without special machinery or tools, the fabricator of the vehicle may affix the label and name itself as the manufacturer for the purposes of this section.

(iii) If a trailer is sold by a person who is not its manufacturer, but who is engaged in the manufacture of trailers and assumes legal responsibility for all duties and liabilities imposed by the Act with respect to that trailer, the name of that person may appear on the label as the manufacturer. In such a case the name shall be preceded by the words “Responsible Manufacturer” or “Resp Mfr.”

(2) Month and year of manufacture: This shall be the time during which work was completed at the place of main assembly of the vehicle. It may be spelled out, as “June 2000”, or expressed in numerals, as “6/00”.

(3) “Gross Vehicle Weight Rating” or “GVWR” followed by the appropriate value in pounds, which shall not be less than the sum of the unloaded vehicle weight, rated cargo load, and 150 pounds times the number of the vehicle’s designated seating positions. However, for school buses the minimum occupant weight allowance shall be 120 pounds per passenger and 150 pounds for the driver.

(4) “Gross Axle Weight Rating” or “GAWR,” followed by the appropriate value in pounds, for each axle, identified in order from front to rear (e.g., front, first intermediate, second intermediate, rear). The ratings for any consecutive axles having identical gross axle weight ratings when equipped with tires having the same tire size designation may, at the option of the manufacturer, be stated as a single value, with the label indicating to which axles the ratings apply.

Examples of combined ratings:

**GAWR:**

(a) All axles—2,400 kg (5,290 lb) with LT245/75R16(E) tires.
(b) Front—2,215 kg (11,500 lb) with 295/75R22.5(G) tires.

First intermediate to rear—9,070 kg (20,000 lb) with 295/75R22.5(G) tires.

(5) One of the following statements, as appropriate:

(i) For passenger cars, the statement: “This vehicle conforms to all applicable Federal motor vehicle safety, bumper, and theft prevention standards in effect on the date of manufacture shown above.” The expression “U.S.” or “U.S.A.” may be inserted before the word “Federal”.

(ii) In the case of multipurpose passenger vehicles (MPVs) and trucks with a GVWR of 6,000 pounds or less, the statement: “This vehicle conforms to all applicable Federal motor vehicle safety and theft prevention standards in effect on the date of manufacture shown above.” The expression “U.S.” or “U.S.A.” may be inserted before the word “Federal”.

(iii) In the case of multipurpose passenger vehicles (MPVs) and trucks with a GVWR of over 6,000 pounds, the statement: “This vehicle conforms to all applicable Federal motor vehicle safety standards in effect on the date of manufacture shown above.” The expression “U.S.” or “U.S.A.” may be inserted before the word “Federal”.

(6) Vehicle identification number.

(7) The type classification of the vehicle as defined in §571.3 of this chapter (e.g., truck, MPV, bus, trailer).

(h) Multiple GVWR–GAWR ratings. (1) (For passenger cars only) In cases in which different tire sizes are offered as a customer option, a manufacturer may at its option list more than one set of values for GVWR and GAWR, to meet the requirements of paragraphs (g) (3) and (4) of this section. If the label shows more than one set of weight rating values, each value shall be followed by the phrase “with tires,” inserting the proper tire size designations. A manufacturer may, at its option, list one or more tire sizes where only one set of weight ratings is provided.

Example: Passenger Car

GVWR: 4,400 lb with P195/65R15 tires; 4,800 lb with P205/75R15 tires.

GAWR: Front—2,000 lb with P195/65R15 tires at 24 psi; 2,200 lb with P205/75R15 tires at 24 psi. Rear—2,400 lb with P195/65R15 tires at 28 psi; 2,600 lb with P205/75R15 tires at 28 psi.
§ 567.4

(2) (For multipurpose passenger vehicles, trucks, buses, trailers, and motorcycles) The manufacturer may, at its option, list more than one GVWR–GAWR-tire-rim combination on the label, as long as the listing contains the tire-rim combination installed as original equipment on the vehicle by the manufacturer and conforms in content and format to the requirements for tire-rim-inflation information set forth in Standard Nos. 110, 120, 129 and 139 (§§ 571.110, 571.120, 571.129 and 571.139 of this chapter).

(3) At the option of the manufacturer, additional GVWR–GAWR ratings for operation of the vehicle at reduced speeds may be listed at the bottom of the certification label following any information that is required to be listed.

(i) [Reserved]

(j) A manufacturer may, at its option, provide information concerning which tables in the document that accompanies the vehicle pursuant to §575.6(a) of this chapter apply to the vehicle. This information may not precede or interrupt the information required by paragraph (g) of this section.

(k) In the case of passenger cars imported into the United States under 49 CFR 591.5(f) to which the label required by this section has not been affixed by the original assembler of the passenger car, a label meeting the requirements of this paragraph shall be affixed before the vehicle is imported into the United States, if the car is from a line listed in Appendix A of 49 CFR part 541. This label shall be in addition to, and not in place of, the label required by paragraphs (a) through (j), inclusive, of this section.

(1) The label shall be riveted or permanently affixed in such a manner that it cannot be removed without destroying or defacing it.

(2) The label shall be affixed to either the hinge pillar, door-latch post, or the door edge that meets the door-latch post, next to the driver’s seating position, or, if none of these locations is practicable, to the left side of the instrument panel. If that location is also not practicable, the label shall be affixed to the inward-facing surface of the door next to the driver’s seating position. The location of the label shall be such that it is easily readable without moving any part of the vehicle except an outer door.

(3) The lettering on the label shall be of a color that contrasts with the background of the label.

(4) The label shall contain the following statements, in the English language, lettered in block capitals and numerals not less than three thirty-seconds of an inch high, in the order shown:

(i) Model year (if applicable) or year of manufacture and line of the vehicle, as reported by the manufacturer that produced or assembled the vehicle. “Model year” is used as defined in §565.3(h) of this chapter. “Line” is used as defined in §541.4 of this chapter.

(ii) Name of the importer. The full corporate or individual name of the importer of the vehicle shall be spelled out, except that such abbreviations as “Co.” or “Inc.” and their foreign equivalents and the middle initial of individuals, may be used. The name of the importer shall be preceded by the words “Imported By”.

(iii) The statement: “This vehicle conforms to the applicable Federal motor vehicle theft prevention standard in effect on the date of manufacture.”

(l) (1) In the case of a passenger car imported into the United States under 49 CFR 591.5(f) which does not have a vehicle identification number that complies with 49 CFR 565.4 (b), (c), and (g) at the time of importation, the Registered Importer shall permanently affix a label to the vehicle in such a manner that, unless the label is riveted, it cannot be removed without being destroyed or defaced. The label shall be in addition to the label required by paragraph (a) of this section, and shall be affixed to the vehicle in a location specified in paragraph (c) of this section.

(2) The label shall contain the following statement, in the English language, lettered in block capitals and numerals not less than 4 mm high, with the location on the vehicle of the original manufacturer’s identification number provided in the blank: ORIGINAL MANUFACTURER’S IDENTIFICATION NUMBER SUBSTITUTING FOR U.S. VIN IS LOCATED _____.
§ 567.5 Requirements for manufacturers of vehicles manufactured in two or more stages.

(a) Location of information labels for incomplete vehicles. Each incomplete vehicle manufacturer or intermediate vehicle manufacturer shall permanently affix a label to each incomplete vehicle, in the location and form specified in §567.4, and in a manner that does not obscure other labels. If the locations specified in 49 CFR 567.4(c) are not practicable, the label may be provided as part of the IVD package so that it can be permanently affixed in the acceptable locations provided for in that subsection when the vehicle is sufficiently manufactured to allow placement in accordance therewith.

(b) Incomplete vehicle manufacturers. (1) Except as provided in paragraph (f) of this section and notwithstanding the certification of a final-stage manufacturer under 49 CFR 567.5(d)(2)(v), each manufacturer of an incomplete vehicle assumes legal responsibility for all certification-related duties and liabilities under the Vehicle Safety Act with respect to:

(i) Components and systems it installs or supplies for installation on the incomplete vehicle, unless changed by a subsequent manufacturer;

(ii) The vehicle as further manufactured or completed by an intermediate or final-stage manufacturer, to the extent that the vehicle is completed in accordance with the IVD; and

(iii) The accuracy of the information contained in the IVD.

(2) Except as provided in paragraph (f) of this section, each incomplete vehicle manufacturer shall affix an information label to each incomplete vehicle that contains the following statements:

(i) Name of incomplete vehicle manufacturer preceded by the words “incomplete vehicle MANUFACTURED BY” or “incomplete vehicle MFD BY”.

(ii) Month and year of manufacture of the incomplete vehicle. This may be spelled out, as in “JUNE 2000”, or expressed in numerals, as in “6/00”. No preface is required.

(iii) “Gross Vehicle Weight Rating” or “GVWR” followed by the appropriate value in kilograms and (pounds), which shall not be less than the sum of

the unloaded vehicle weight, rated cargo load, and 150 pounds times the number of the vehicle’s designated seating positions, if known. However, for school buses the minimum occupant weight allowance shall be 120 pounds per passenger and 150 pounds for the driver.

(iv) “Gross Axle Weight Rating” or “GAWR,” followed by the appropriate value in kilograms and (pounds) for each axle, identified in order from front to rear (e.g., front, first intermediate, second intermediate, rear).

The ratings for any consecutive axles having identical gross axle weight ratings when equipped with tires having the same tire size designation may be stated as a single value, with the label indicating to which axles the ratings apply.

(v) Vehicle Identification Number.

(c) Intermediate manufacturers. (1) Except as provided in paragraphs (f) and (g) of this section and notwithstanding the certification of a final-stage manufacturer under §567.5(d)(2)(v), each intermediate manufacturer of a vehicle manufactured in two or more stages assumes legal responsibility for all certification-related duties and liabilities under the Vehicle Safety Act with respect to:

(i) Components and systems it installs or supplies for installation on the incomplete vehicle, unless changed by a subsequent manufacturer;

(ii) The vehicle as further manufactured or completed by an intermediate or final-stage manufacturer, to the extent that the vehicle is completed in accordance with the addendum to the IVD furnished by the intermediate vehicle manufacturer;

(iii) Any work done by the intermediate manufacturer on the incomplete vehicle that was not performed in accordance with the IVD or an addendum of a prior intermediate manufacturer; and

(iv) The accuracy of the information in any addendum to the IVD furnished by the intermediate vehicle manufacturer.

(2) Except as provided in paragraphs (f) and (g) of this section, each intermediate manufacturer of an incomplete vehicle shall affix an information...
§567.5

49 CFR Ch. V (10–1–08 Edition)

(i) Name of intermediate manufacturer, preceded by the words “INTERMEDIATE MANUFACTURE BY” or “INTERMEDIATE MFR”.

(ii) Month and year in which the intermediate manufacturer performed its last manufacturing operation on the incomplete vehicle. This may be spelled out, as in “JUNE 2000”, or expressed as numerals, as in “6/00”. No preface is required.

(iii) “Gross Vehicle Weight Rating” or “GVWR”, followed by the appropriate value in kilograms and (pounds), if different from that identified by the incomplete vehicle manufacturer.

(iv) “Gross Axle Weight Rating” or “GAWR”, followed by the appropriate value in kilograms and (pounds), if different from that identified by the incomplete vehicle manufacturer.

(v) Vehicle identification number.

(d) Final-stage manufacturers. (1) Except as provided in paragraphs (f) and (g) of this section, each final-stage manufacturer of a vehicle manufactured in two or more stages assumes legal responsibility for all certification-related duties and liabilities under the Vehicle Safety Act, except to the extent that the incomplete vehicle manufacturer or an intermediate manufacturer has provided equipment subject to a safety standard or expressly assumed responsibility for standards related to systems and components it supplied and except to the extent that the final-stage manufacturer completed the vehicle in accordance with the prior manufacturers’ IVD or any addendum furnished pursuant to 49 CFR part 568, as to the Federal motor vehicle safety standards fully addressed therein.

(2) Except as provided in paragraphs (f) and (g) of this section, each final-stage manufacturer shall affix a certification label to each vehicle, in a manner that does not obscure the labels applied by previous stage manufacturers, and that contains the following statements:

(i) Name of final-stage manufacturer, preceded by the words “MANUFACTURE BY” or “MFR BY”.

(ii) Month and year in which final-stage manufacture is completed. This may be spelled out, as in “JUNE 2000”, or expressed in numerals, as in “6/00”. No preface is required.

(iii) “Gross Vehicle Weight Rating” or “GVWR” followed by the appropriate value in kilograms and (pounds), which shall not be less than the sum of the unloaded vehicle weight, rated cargo load, and 150 pounds times the number of the vehicle’s designated seating positions. However, for school buses the minimum occupant weight allowance shall be 120 pounds per passenger and 150 pounds for the driver.

(iv) “GROSS AXLE WEIGHT RATING” or “GAWR”, followed by the appropriate value in kilograms and (pounds) for each axle, identified in order from front to rear (e.g., front, first intermediate, second intermediate, rear). The ratings for any consecutive axles having identical gross axle weight ratings when equipped with tires having the same tire size designation may be stated as a single value, with the label indicating to which axles the ratings apply.

Examples of combined ratings: (a) All axles—2,400 kg (5,290 lb) with LT245/75R16(E) tires;

(b) Front—5,215 kg (11,500 lb) with 295/75R22.5(G) tires;

(c) First intermediate to rear—9,070 kg (20,000 lb) with 295/75R22.5(G) tires.

(v)(A) One of the following alternative certification statements:

(1) “This vehicle conforms to all applicable Federal Motor Vehicle Safety Standards, [and Bumper and Theft Prevention Standards, if applicable] in effect in (month, year).”

(2) “This vehicle has been completed in accordance with the prior manufacturers’ IVD, where applicable. This vehicle conforms to all applicable Federal Motor Vehicle Safety Standards, [and Bumper and Theft Prevention Standards, if applicable] in effect in (month, year).”

(3) “This vehicle has been completed in accordance with the prior manufacturers’ IVD, where applicable, except for [insert FMVSS(s)]. This vehicle conforms to all applicable Federal Motor Vehicle Safety Standards, [and
§ 567.7 Requirements for persons who alter certified vehicles.

(a) With respect to the vehicle alterations it performs, an alterer:

(1) Has a duty to determine continued conformity of the altered vehicle with applicable Federal motor vehicle safety, Bumper, and Theft Prevention standards, and

(2) Assumes legal responsibility for all duties and liabilities for certification under the Vehicle Safety Act.

(b) The vehicle manufacturer’s certification label and any information labels shall remain affixed to the vehicle and the alterer shall affix to the vehicle an additional label in the manner and location specified in § 567.4, in a manner that does not obscure any previously applied labels, and containing the following information:

(1) The statement: “This vehicle was altered by (individual or corporate name) in (month and year in which alterations were completed) and as altered it conforms to all applicable Federal Motor Vehicle Safety, Bumper and Theft Prevention Standards affected by the alteration and in effect in (month, year).” The second date shall be no earlier than the date of manufacture of the certified vehicle (as specified on

§ 567.6 Requirements for persons who do not alter certified vehicles or do so with readily attachable components.

A person who does not alter a motor vehicle or who alters such a vehicle only by the addition, substitution, or removal of readily attachable components such as mirrors or tires and rim assemblies, or minor finishing operations such as painting, in such a manner that the vehicle’s stated weight ratings are still valid, need not affix a label to the vehicle, but shall allow a manufacturer’s label that conforms to the requirements of this part to remain affixed to the vehicle. If such a person is a distributor of the motor vehicle, allowing the manufacturer’s label to remain affixed to the vehicle shall satisfy the distributor’s certification requirements under the Vehicle Safety Act.
the certification label), and no later than the date alterations were completed.

(2) If the gross vehicle weight rating or any of the gross axle weight ratings of the vehicle as altered are different from those shown on the original certification label, the modified values shall be provided in the form specified in §567.4(g)(3) and (4).

(3) If the vehicle as altered has a different type classification from that shown on the original certification label, the type as modified shall be provided.

PART 568—VEHICLES MANUFACTURED IN TWO OR MORE STAGES—ALL INCOMPLETE, INTERMEDIATE AND FINAL-STAGE MANUFACTURERS OF VEHICLES MANUFACTURED IN TWO OR MORE STAGES

§ 568.1 Purpose and scope.

The purpose of this part is to prescribe the method by which manufacturers of vehicles, manufactured in two or more stages shall ensure conformity of those vehicles with the Federal motor vehicle safety standards ("standards") and other regulations issued under the National Traffic and Motor Vehicle Safety Act, as amended (49 U.S.C. § 30115) and the Motor Vehicle Information and Cost Savings Act, as amended (49 U.S.C. 32504 and 33108(c)).

§ 568.2 Application.

This part applies to incomplete vehicle manufacturers, intermediate manufacturers, and final-stage manufacturers of vehicles manufactured in two or more stages.

§ 568.3 Definitions.

All terms that are defined in the Act and the rules and standards issued under its authority are used as defined therein. The term "bumper" has the meaning assigned to it in Title I of the Cost Savings Act and the rules and standards issued under its authority. The definitions contained in 49 CFR Part 567 apply to this part.

§ 568.4 Requirements for incomplete vehicle manufacturers.

(a) The incomplete vehicle manufacturer shall furnish for each incomplete vehicle, at or before the time of delivery, an incomplete vehicle document ("IVD") that contains the following statements, in the order shown, and all other information required by this part to be included therein:

(1) Name and mailing address of the incomplete vehicle manufacturer.

(2) Month and year during which the incomplete vehicle manufacturer performed its last manufacturing operation on the incomplete vehicle.

(3) Identification of the incomplete vehicle(s) to which the document applies. The identification shall be by vehicle identification number (VIN) or groups of VINs to permit a person to ascertain positively that a document applies to a particular incomplete vehicle after the document has been removed from the vehicle.

(4) Gross vehicle weight rating (GVWR) of the completed vehicle for which the incomplete vehicle is intended.

(5) Gross axle weight rating (GAWR) for each axle of the completed vehicle for which the incomplete vehicle is intended, listed and identified in order from front to rear (e.g., front, first intermediate, second intermediate, rear). The ratings for any consecutive axles having identical gross axle weight ratings when equipped with tires having the same tire size designation may, at the option of the incomplete vehicle manufacturer, be stated as a single value, with the label indicating to which axles the ratings apply.
Examples of combined ratings: (a) All axles—2,400 kg (5,290 lb) with LT245/75R16(E) tires; (b) Front—5,215 kg (11,500 lb) with 295/75R22.5(G) tires. (c) First intermediate to rear—9,070 kg (20,000 lb) with 295/75R22.5(G) tires.

(6) Listing of the vehicle types as defined in 49 CFR 571.3 (e.g., truck, MPV, bus, trailer) into which the incomplete vehicle may appropriately be manufactured.

(7) Listing, by number, of each standard, in effect at the time of manufacture of the incomplete vehicle, that applies to any of the vehicle types listed in paragraph (a)(6) of this section, followed in each case by one of the following three types of statement, as applicable:

(i) Type 1—A statement that the vehicle when completed will conform to the standard if no alterations are made in identified components of the incomplete vehicle.

Example: 104—This vehicle when completed will conform to FMVSS No. 104, Windshield Wiping and Washing Systems, if no alterations are made in the windshield wiper components.

(ii) Type 2—A statement of specific conditions of final manufacture under which the manufacturer specifies that the completed vehicle will conform to the standard.

Example: 121—This vehicle when completed will conform to FMVSS No. 121, Air Brake Systems, if it does not exceed any of the gross axle weight ratings, if the center of gravity at GVWR is not higher than nine feet above the ground, and if no alterations are made in any brake system component.

(iii) Type 3—A statement that conformity with the standard cannot be determined based upon the components supplied on the incomplete vehicle, and that the incomplete vehicle manufacturer makes no representation as to conformity with the standard.

(8) Each document shall contain a table of contents or chart summarizing all the standards applicable to the vehicle pursuant to 49 CFR 568.4(a)(7).

(9) A certification that the statements contained in the incomplete vehicle document are accurate as of the date of manufacture of the incomplete vehicle and can be used and relied on by any intermediate and/or final-stage manufacturer as a basis for certification.

(b) To the extent the IVD expressly incorporates by reference body builder or other design and engineering guidance (Reference Material), the incomplete vehicle manufacturer shall make such Reference Material readily available to subsequent manufacturers. Reference Materials incorporated by reference in the IVD shall be deemed to be part of the IVD.

(c) The IVD shall be attached to the incomplete vehicle in such a manner that it will not be inadvertently detached, or alternatively, it may be sent directly to a final-stage manufacturer, intermediate manufacturer or purchaser for purposes other than resale to whom the incomplete vehicle is delivered. The Reference Material in paragraph (b) of this section need not be attached to each vehicle.

by the final-stage manufacturer, including the date of manufacture of the incomplete vehicle, the date of final completion, or a date between those two dates. This requirement shall, however, be superseded by any conflicting provisions of a standard that applies by its terms to vehicles manufactured in two or more stages.

§ 568.7 Requirements for manufacturers who assume legal responsibility for a vehicle.

(a) If an incomplete vehicle manufacturer assumes legal responsibility for all duties and liabilities imposed on manufacturers by the National Traffic and Motor Vehicle Safety Act, as amended (49 U.S.C. chapter 301) (hereafter referred to as the Act), with respect to a vehicle as finally manufactured, the requirements of §§ 568.4, 568.5 and 568.6 do not apply to that vehicle. In such a case, the incomplete vehicle manufacturer shall ensure that a label is affixed to the final vehicle in conformity with 49 CFR 567.5(f).

(b) If an intermediate manufacturer of a vehicle assumes legal responsibility for all duties and liabilities imposed on manufacturers by the Vehicle Safety Act, with respect to the vehicle as finally manufactured, §§ 568.5 and 568.6 do not apply to that vehicle. In such a case, the intermediate vehicle manufacturer shall ensure that a label is affixed to the final vehicle in conformity with 49 CFR 567.5(g). The assumption of responsibility by an intermediate manufacturer does not, however, change the requirements for incomplete vehicle manufacturers in § 568.4.

PART 569—REGROOVED TIRES

Sec.
569.1 Purpose and scope.
569.3 Definitions.
569.5 Applicability.
569.7 Requirements.
569.9 Labeling of regroovable tires.

AUTHORITY: Secs. 119, 204, 80 Stat. 728, 729 (15 U.S.C. 1407, 1424); and Secretary’s delegation of authority, 49 CFR 1.4(c).

§ 569.1 Purpose and scope.

This part sets forth the conditions under which regrooved and regroovable tires manufactured or regrooved after the effective date of the regulation may be sold, offered for sale, introduced for sale or delivered for introduction into interstate commerce.

[42 FR 21613, Apr. 28, 1977]

§ 569.3 Definitions.

(a) Statutory definitions. All terms used in this part that are defined in section 102 of the National Traffic and Motor Vehicle Safety Act of 1966 (15 U.S.C. 1391) are used as defined in the Act.

(b) Motor Vehicle Safety Standard definitions. Unless otherwise indicated, all terms used in this part that are defined in the Motor Vehicle Safety Standards, part 571, of this subchapter (hereinafter “The Standards”), are used as defined therein without regard to the applicability of a standard in which a definition is contained.

(c) Regroovable tire means a tire, either original tread or retread, designed and constructed with sufficient tread material to permit renewal of the tread pattern or the generation of a new tread pattern in a manner which conforms to this part.

(d) Regrooved tire means a tire, either original tread or retread, on which the tread pattern has been renewed or a new tread has been produced by cutting into the tread of a worn tire to a depth equal to or deeper than the molded original groove depth.

§ 569.5 Applicability.

(a) General. Except as provided in paragraph (b) of this section, this part applies to all motor vehicle regrooved or regroovable tires manufactured or regrooved after the effective date of the regulation.

(b) Export. This part does not apply to regrooved or regroovable tires intended solely for export and so labeled or tagged.

§ 569.7 Requirements.

(a) Regrooved tires. (1) Except as permitted by paragraph (a)(2) of this section, no person shall sell, offer for sale, or introduce or deliver for introduction
Nat’l Highway Traffic Safety Admin., DOT

§ 569.9 Labeling of regroovable tires.

(a) Regroovable tires. After August 30, 1969, each tire designed and constructed for regrooving shall be labeled on both sidewalls with the word "Regroovable" molded on or into the tire in raised or recessed letters 0.025 to 0.040 inch. The word "Regroovable" shall be in letters 0.38 to 0.50 inch in height and not less than 4 inches and not more than 6 inches in length. The lettering shall be located in the sidewall of the tire between the maximum section width and the bead in an area which will not be obstructed by the rim flange.

§ 570.63 Wheel assemblies.

Subpart A—Vehicles With GVWR of 10,000 Pounds or Less

SOURCE: 38 FR 23950, Sept. 5, 1973, unless otherwise noted.

§ 570.1 Scope.

This part specifies standards and procedures for inspection of hydraulic service brake systems, steering and suspension systems, and tire and wheel assemblies of motor vehicles in use.

§ 570.2 Purpose.

The purpose of this part is to establish criteria for the inspection of motor vehicles by State inspection systems, in order to reduce death and injuries attributable to failure or inadequate performance of motor vehicle systems.

§ 570.3 Applicability.

This part does not in itself impose requirements on any person. It is intended to be implemented by States through the highway safety program standards issued under the Highway Safety Act (23 U.S.C. 402) with respect to inspection of motor vehicles with gross vehicle weight rating of 10,000 pounds or less, except motorcycles or trailers.

§ 570.4 Definitions.

Unless otherwise indicated, all terms used in this part that are defined in 49 CFR part 571, Motor Vehicle Safety Standards, are used as defined in that part.

§ 570.5 Service brake system.

Unless otherwise noted, the force to be applied during inspection procedures to power-assisted and full-power brake systems is 25 lb, and to all other systems, 50 lb.

(a) Failure indicator. The brake system failure indicator lamp, if part of a vehicle’s original equipment, shall be operable. (This lamp is required by Federal Motor Vehicle Safety Standard No. 105, 49 CFR 571.105, on every new passenger car manufactured on or after January 1, 1968, and on other types of motor vehicles manufactured on or after September 1, 1975.)

(1) Inspection procedure. Apply the parking brake and turn the ignition to start, or verify lamp operation by other means indicated by the vehicle manufacturer that the brake system failure indicator lamp is operable.

(b) Brake system integrity. The brake system shall demonstrate integrity as indicated by no perceptible decrease in pedal height under a 125 pound force applied to the brake pedal or by no illumination of the brake system failure indicator lamp. The brake system shall withstand the application of force to the pedal without failure of any line or other part.

(1) Inspection procedures. With the engine running on vehicles equipped with power brake systems, and the ignition turned to “on” in other vehicles, apply a force of 125 pounds to the brake pedal and hold for 10 seconds. Note any decrease in pedal height, and whether the lamp illuminates.

(c) Brake pedal reserve. When the brake pedal is fully depressed, the distance that the pedal has traveled from its free position shall be not greater than 80 percent of the total distance from its free position to the floorboard or other object that restricts pedal travel.

(1) Inspection procedure. Measure the distance (A) from the free pedal position to the floorboard or other object that restricts brake pedal travel. Depress the brake pedal, and with the force applied measure the distance (B) from the depressed pedal position to the floorboard or other object that restricts pedal travel.

Determine the percentage as

\[ \left( \frac{A - B}{A} \right) \times 100 \]

The engine must be operating when power-assisted brakes are checked. The pedal reserve check is not required for vehicles equipped with full power (central hydraulic) brake systems, or to vehicles with brake systems designed to operate with greater than 80 percent pedal travel.

(d) Service brake performance. Compliance with one of the following performance criteria will satisfy the requirements of this section. Verify that tire
inflation pressure is within the limits recommended by vehicle manufacturer before conducting either of the following tests.

(1) **Roller-type or drive-on platform tests.** The force applied by the brake on a front wheel or a rear wheel shall not differ by more than 20 percent from the force applied by the brake on the other front wheel or the other rear wheel respectively.

(i) **Inspection procedure.** The vehicle shall be tested on a drive-on platform, or a roller-type brake analyzer with the capability of measuring equalization. The test shall be conducted in accordance with the test equipment manufacturer’s specifications. Note the left to right brake force variance.

(2) **Road test.** The service brake system shall stop the vehicle in a distance of 25 feet or less from a speed of 20 miles per hour without leaving a 12-foot-wide lane.

(i) **Inspection procedure.** The road test shall be conducted on a level (not to exceed plus or minus one percent grade) dry, smooth, hard-surfaced road that is free from loose material, oil, or grease. The service brakes shall be applied at a vehicle speed of 20 miles per hour and the vehicle shall be brought to a stop as specified. Measure the distance required to stop.

(e) **Brake hoses and assemblies.** Brake hoses shall not be mounted so as to contact the vehicle body or chassis. Hoses shall not be cracked, chafed, or flattened. Protective devices, such as “rub rings,” shall not be considered part of the hose or tubing.

(1) **Inspection procedure.** Examine visually, inspecting front brake hoses through all wheel positions from full left to full right for conditions indicated.

**Note:** To inspect for paragraphs (f), (g), and (h) of this section, remove at a minimum one front wheel and one rear wheel.

(f) **Disc and drum condition.** If the drum is embossed with a maximum safe diameter dimension or the rotor is embossed with a minimum safety thickness dimension, the drum or disc shall be within the appropriate specifications. These dimensions will be found on motor vehicles manufactured since January 1, 1971, and may be found on vehicles manufactured for several years prior to that time. If the drums and discs are not embossed, the drums and discs shall be within the manufacturer’s specifications.

(1) **Inspection procedure.** Examine visually for condition indicated, measuring as necessary.

(g) **Friction materials.** On each brake the thickness of the lining or pad shall not be less than one thirty-second of an inch over the rivet heads, or the brake shoe on bonded linings or pads. Brake linings and pads shall not have cracks or breaks that extend to rivet holes except minor cracks that do not impair attachment. Drum brake linings shall be securely attached to brake shoes. Disc brake pads shall be securely attached to shoe plates.

(1) **Inspection procedure.** Examine visually for conditions indicated, and measure height of rubbing surface of lining over rivet heads. Measure bonded lining thickness over shoe surface at the thinnest point on the lining or pad.

(h) **Structural and mechanical parts.** Backing plates and caliper assemblies shall not be deformed or cracked. System parts shall not be broken, misaligned, missing, binding, or show evidence of severe wear. Automatic adjusters and other parts shall be assembled and installed correctly.

(1) **Inspection procedure.** Examine visually for conditions indicated.

§ 570.6 **Brake power unit.**

(a) Vacuum hoses shall not be collapsed, abraded, broken, improperly mounted, or audibly leaking. With residual vacuum exhausted and a constant 25 pound force on the brake pedal, the pedal shall fall slightly when the engine is started, demonstrating integrity of the power assist system. This test is not applicable to vehicles equipped with full power brake system as the service brake performance test shall be considered adequate test of system performance.

(1) **Inspection procedure.** With engine running, examine hoses visually and aurally for conditions indicated. Stop engine and apply service brakes several times to destroy vacuum in system. Depress brake pedal with 25 pounds of
§ 570.7 Steering systems.

(a) System play. Lash or free play in the steering system shall not exceed values shown in Table 1.

(1) Inspection procedure. With the engine on and the wheels in the straight ahead position, turn the steering wheel in one direction until there is a perceptible movement of a front wheel. If a point on the steering wheel rim moves more than the value shown in Table 1 before perceptible return movement of the wheel under observation, there is excessive lash or free play in the steering system.

<table>

<td>2 3/4</td>
</tr>
</tbody>
</table>

(b) Linkage play. Free play in the steering linkage shall not exceed one-quarter of an inch.

(1) Inspection procedure. Elevate the front end of the vehicle to load the ball joints. Insure that wheel bearings are correctly adjusted. Grasp the front and rear of a tire and attempt to turn the tire and wheel assembly left and right. If the free movement at the front or rear tread of the tire exceeds one-quarter inch there is excessive steering linkage play.

(c) Free turning. Steering wheels shall turn freely through the limit of travel in both directions.

(1) Inspection procedure. Turn off steering wheel through the limit of travel in both directions. Feel for binding or jamming in the steering gear mechanism.

(d) Alignment. Toe-in and toe-out measurements shall not be greater than 1.5 times the value listed in the vehicle manufacturer's service specification for alignment setting.

(1) Inspection procedure. Verify that toe-in or toe-out is not greater than 1.5 times the values listed in the vehicle manufacturer’s service specification for alignment setting.

(e) Power steering system. The power steering system shall not have cracked or slipping belts, or insufficient fluid in the reservoir.

(1) Inspection procedure. Examine fluid reservoir and pump belts for conditions indicated.

§ 570.8 Suspension systems.

(a) Suspension condition. Ball joint seals shall not be cut or cracked. Structural parts shall not be bent or damaged. Stabilizer bars shall be connected. Springs shall not be broken, or extended above the vehicle manufacturer’s design height. Spacers, if installed, shall be installed on both front springs, both rear springs, or on all
four springs. Shock absorber mountings, shackles, and U-bolts shall be securely attached. Rubber bushings shall not be cracked, extruded out from or missing from suspension joints. Radius rods shall not be missing or damaged.

1. Inspection procedure. Examine front and rear end suspension parts for conditions indicated.
2. Shock absorber condition. There shall be no oil on the shock absorber housing attributable to leakage by the seal, and the vehicle shall not continue free rocking motion for more than two cycles.

1. Inspection procedure. Examine shock absorbers for oil leaking from within, then with vehicle on a level surface, push down on one end of vehicle and release. Note number of cycles of free rocking motion. Repeat procedure at other end of vehicle.

§ 570.9 Tires.

1. Tread depth. The tread on each tire shall be not less than two thirtyseconds of an inch deep.

1. Inspection procedure. Passenger car tires have tread depth indicators that become exposed when tread depth is less than two thirtyseconds of an inch. Inspect for indicators in any two adjacent major grooves at three locations spaced approximately equally around the outside of the tire. For vehicles other than passenger cars, it may be necessary to measure tread depth with a tread gauge.

2. Type. Vehicle shall be equipped with tires on the same axle that are matched in tire size designation, construction, and profile.

1. Inspection procedures. Examine visually. A major mismatch in tire size designation, construction, and profile between tires on the same axle, or a major deviation from the size as recommended by the manufacturer (e.g., as indicated on the glove box placard on 1968 and later passenger cars) are causes for rejection.

2. General condition. Tires shall be free from chunking, bumps, knots, or bulges evidencing cord, ply, or tread separation from the casing or other adjacent materials.

1. Inspection procedure. Examine visually for conditions indicated.
2. Damage. Tire cords or belting materials shall not be exposed, either to the naked eye or when cuts or abrasions on the tire are probed.

1. Inspection procedures. Examine visually for conditions indicated, using a blunt instrument if necessary to probe cuts or abrasions.

[38 FR 23950, Sept. 5, 1973, as amended at 44 FR 68470, Nov. 29, 1979]

§ 570.10 Wheel assemblies.

1. Wheel integrity. A tire rim, wheel disc, or spider shall have no visible cracks, elongated bolt holes, or indication of repair by welding.

1. Inspection procedure. Examine visually for conditions indicated.

2. Deformation. The lateral and radial runout of each rim bead area shall not exceed one-eighth of an inch of total indicated runout.

1. Inspection procedure. Using a runout indicator gauge, and a suitable stand, measure lateral and radial runout of rim bead through one full wheel revolution and note runout in excess of one-eighth of an inch.

2. Mounting. All wheel nuts and bolts shall be in place and tight.

1. Inspection procedure. Check wheel retention for conditions indicated.

Subpart B—Vehicles With GVWR of More Than 10,000 Pounds

Source: 39 FR 26027, July 16, 1974, unless otherwise noted.

§ 570.51 Scope.

This part specifies standards and procedures for the inspection of brake, steering and suspension systems, and tire and wheel assemblies, of motor vehicles in use with a gross vehicle weight rating of more than 10,000 pounds.

§ 570.52 Purpose.

The purpose of this part is to establish criteria for the inspection of motor vehicles through State inspection programs, in order to reduce deaths and
§ 570.53 Applicability.

This part does not in itself impose requirements on any person. It is intended to be implemented by States through the highway safety program standards issued under the Highway Safety Act (23 U.S.C. 402) with respect to inspection of motor vehicles with gross vehicle weight rating greater than 10,000 pounds, except mobile structure trailers.

[39 FR 28980, Aug. 13, 1974]

§ 570.54 Definitions.

Unless otherwise indicated, all terms used in this part that are defined in part 571 of this chapter, Motor Vehicle Safety Standards, are used as defined in that part.

Air-over-hydraulic brake subsystem means a subsystem of the air brake that uses compressed air to transmit a force from the driver control to a hydraulic brake system to actuate the service brakes.

Electric brake system means a system that uses electric current to actuate the service brake.

Vacuum brake system means a system that uses a vacuum and atmospheric pressure for transmitting a force from the driver control to the service brake, but does not include a system that uses vacuum only to assist the driver in applying muscular force to hydraulic or mechanical components.

§ 570.55 Hydraulic brake system.

The following requirements apply to vehicles with hydraulic brake systems.

(a) Brake system failure indicator. The hydraulic brake system failure indicator lamp, if part of a vehicle’s original equipment, shall be operable.

(1) Inspection procedure. Apply the parking brake and turn the ignition to start to verify that the brake system failure indicator lamp is operable, or verify by other means recommended by the vehicle manufacturer.

(b) Brake system integrity. The hydraulic brake system shall demonstrate integrity as indicated by no perceptible decrease in pedal height under a 125-pound force applied to the brake pedal and by no illumination of the brake system failure indicator lamp. The brake system shall withstand the application of force to the pedal without failure of any tube, hose or other part.

(c) Brake pedal reserve. When the brake pedal is depressed with a force of 50 pounds, the distance that the pedal has traveled from its free position shall not be greater than 80 percent of the total distance from its free position to the floorboard or other object that restricts pedal travel. The brake pedal reserve test is not required for vehicles with brake systems designed by the original vehicle manufacturer to operate with greater than 80 percent pedal travel.

(1) Inspection procedure. Measure the distance (i) from the free pedal position to the floor board or other object that restricts brake pedal travel. Depress the brake pedal, and with the force applied measure the distance (ii) from the depressed pedal position to the floorboard or other object that restricts pedal travel. Determine the pedal travel percentage as

\[\frac{(A - B)}{A} \times 100\]

The engine must be operating when power-assisted brakes are checked.

(d) Brake hoses, master cylinder, tubes and tube assemblies. Hydraulic brake hoses shall not be mounted so as to contact the vehicle body or chassis. Hoses shall not be cracked, chafed, or flattened. Brake hoses shall not be flattened or restricted. Brake hoses and tubes shall be attached or supported to prevent damage by vibration or abrasion. Master cylinder shall not show signs of leakage. Hose or tube protective rings or devices shall not be considered part of the hose or tubing.

(1) Inspection procedure. Examine visually brake master cylinder, hoses and tubes, including front brake hoses,
§ 570.56 Vacuum brake assist unit and vacuum brake system.

The following requirements apply to vehicles with vacuum brake assist units and vacuum brake systems.

(a) Vacuum brake assist unit integrity.

The vacuum brake assist unit shall demonstrate integrity as indicated by a decrease in pedal height when the engine is started and a constant 50-pound force is maintained on the pedal.

(1) Inspection procedure. Stop the engine and apply service brake several times to destroy vacuum in system. Depress the brake pedal with 50 pounds of force and while maintaining that force, start the engine. If the brake pedal does not move slightly under force when the engine starts, there is a malfunction in the power assist unit.

(b) Low-vacuum indicator. If the vehicle has a low-vacuum indicator, the indicator activation level shall not be less than 8 inches of mercury.

(1) Inspection procedure. Run the engine to evacuate the system fully. Shut off the engine and slowly reduce the vacuum in the system by moderate brake applications until the vehicle vacuum gauge reads 8 inches of mercury. Observe the functioning of the low-vacuum indicator.

(c) Vacuum brake system integrity.

The vacuum brake system shall demonstrate integrity by meeting the following requirements:

(i) The vacuum brake system shall provide vacuum reserve to permit one service brake application with a brake pedal force of 50 pounds after the engine is turned off without actuating the low vacuum indicator.

(ii) Trailer vacuum brakes shall operate in conjunction with the truck or truck tractor brake pedal.

(1) Inspection procedure. (i) Check the trailer vacuum system by coupling trailer(s) to truck or truck tractor and opening trailer shutoff valves. Start the engine and after allowing approximately 1 minute to build up the vacuum, apply and release the brake pedal. In the case of trailer brakes equipped with brake chamber rods, observe the chamber rod movement. Run the engine to re-establish maximum vacuum, then shut off the engine and apply the brakes with a 50-pound force on the brake pedal. Note the brake application and check for low-vacuum indicator activation.

(ii) For a combination vehicle equipped with breakaway protection and no reservoir on the towing vehicle supply line, close the supply line shut-off valve and disconnect the supply line. Apply a 50-pound force to the brake pedal on the towing vehicle and release. Trailer brakes should remain in the applied position.

(d) Vacuum system hoses, tubes and connections. Vacuum hoses, tubes and connections shall be in place and properly supported. Vacuum hoses shall not be collapsed, cracked or abraded.

(1) Inspection procedure. With the engine running, examine hoses and tubes for the conditions indicated and note broken or missing clamps.

§ 570.57 Air brake system and air-over-hydraulic brake subsystem.

The following requirements apply to vehicles with air brake and air-over-hydraulic brake systems. Trailer(s) must be coupled to a truck or truck tractor for the purpose of this inspection, except as noted.

(a) Air brake system integrity. The air brake system shall demonstrate integrity by meeting the following requirements:

(1) With the vehicle in a stationary position, compressed air reserve shall be sufficient to permit one full service brake application, after the engine is stopped and with the system fully charged, without lowering reservoir pressure more than 20 percent below the initial reading.

(2) The air brake system compressor shall increase the air pressure in the reservoir(s) from the level developed after the test prescribed in §570.57(a)(1) to the initial pressure noted before the full brake application, with the engine running at the manufacturer’s maximum recommended number of revolutions per minute with the compressor governor in the cut-off position, in not more than 30 seconds for vehicles manufactured prior to March 1, 1975.
$570.57  49 CFR Ch. V (10–1–08 Edition)

vehicles, manufactured on or after March 1, 1975, the time allowed for air pressure buildup shall not exceed 45 seconds.

(3) The warning device (visual or audible) connected to the brake system air pressure source shall be activated when air pressure is lowered to an activating level that is not less than 50 psi. For vehicles manufactured to conform to Federal Motor Vehicle Safety Standard No. 121, the low-pressure indicator shall be activated when air pressure is lowered to an activating level that is not less than 60 psi.

(4) The governor cut-in pressure shall be not lower than 80 psi, and the cut-out pressure shall not be higher than 135 psi, unless other values are recommended by the vehicle manufacturer.

(5) Air brake pressure shall not drop more than 2 psi in 1 minute for single vehicles or more than 3 psi in 1 minute for combination vehicles, with the engine stopped and service brakes released. There may be an additional 1 psi drop per minute for each additional towed vehicle.

(6) With the reservoir(s) fully charged, air pressure shall not drop more than 3 psi in 1 minute for single vehicles or more than 4 psi in 1 minute for combination vehicles, with the engine stopped and service brakes fully applied. There may be an additional 1 psi drop per minute for each additional towed vehicle.

(7) The compressor drive belt shall not be badly worn or frayed and belt-tension shall be sufficient to prevent slippage.

Inspection procedure. With the air system charged, open the drain cocks in the service and supply reservoir on the truck or truck-tractor. Note the pressure at which the visual or audible warning device connected to the low-pressure indicator is activated. Close the drain cocks, and, with the trailer(s) uncoupled, check air pressure buildup at the manufacturer’s recommended engine speed. Observe the time required to raise the air pressure from 85 to 100 psi. Continue running the engine until the governor cuts out and note the pressure. Reduce engine speed to idle, couple the trailer(s), if applicable, and make a series of brake applica-

(b) Air brake system hoses, tubes and connections. Air system tubes, hoses and connections shall not be restricted, cracked or improperly supported, and the air hose shall not be abraded.

(1) Inspection procedure. Stop the engine and examine air hoses, tubes and connections visually for conditions specified.

(c) Air-over-hydraulic brake subsystem integrity. The air-over-hydraulic brake subsystem shall demonstrate integrity by meeting the following requirements:

(1) The air brake system compressor shall increase the air pressure in the reservoir(s) from the level developed after the test prescribed in §570.57(a)(1) to the initial pressure noted before the full brake application, with the engine running at the manufacturer’s recommended number of revolutions per minute and the compressor governor in the cut-out position, in not more than 30 seconds for vehicles manufactured prior to March 1, 1975. For vehicles manufactured on or after March 1, 1975, the time for air pressure build up shall not exceed 45 seconds.

(2) The warning device (visual or audible) connected to the brake system air pressure source shall be activated when the air pressure is lowered to not less than 50 psi.

(3) The governor cut-in pressure shall be not lower than 80 psi, and the cut-out pressure shall not be higher than 135 psi, unless other values are recommended by the vehicle manufacturer.

(4) Air brake pressure shall not drop more than 2 psi in 1 minute for single vehicles or more than 3 psi in 1 minute for combination vehicles, with the engine stopped and service brakes released. Allow a 1-psi drop per minute for each additional towed vehicle.

(5) With the reservoir(s) fully charged, air pressure shall not drop more than 3 psi in 1 minute for single vehicles or more than 4 psi in 1 minute for combination vehicles, with the engine stopped and service brakes fully
applied. Allow a 1-psi pressure drop in 1 minute for each additional towed vehicle.

(6) The compressor drive belt shall not be badly worn or frayed and belt tension shall be sufficient to prevent slippage.  

*Inspection procedure.* With the air system charged, open the drain cocks in the service and supply reservoir on the truck or truck-tractor. Note the pressure at which the visual or audible warning device connected to the low pressure indicator is activated. Close the drain cocks and, with the trailers uncoupled, check air pressure buildup at the manufacturer’s recommended engine speed. Observe the time required to raise the air pressure from 85 to 100 psi. Continue running the engine until the governor cuts out and note the pressure. Reduce engine speed to idle, couple trailers, and make a series of brake applications. Note the pressure at which the governor cuts in. Increase engine speed to fast idle and charge the system to its governed pressure. Stop the engine and record the pressure drop in psi per minute with brakes released and with brakes fully applied.

(d) Air-over-hydraulic brake subsystem hoses, master cylinder, tubes and connections. System tubes, hoses and connections shall not be cracked or improperly supported, the air and hydraulic hoses shall not be abraded and the master cylinder shall not show signs of leakage.

(1) *Inspection procedure.* Stop the engine and examine air and hydraulic brake hoses, brake master cylinder, tubes and connections visually for conditions specified.

§ 570.58 Electric brake system.

(a) Electric brake system integrity. The average brake amperage value shall be not more than 20 percent above, and not less than 30 percent below, the brake manufacturer’s maximum current rating. In progressing from zero to maximum, the ammeter indication shall show no fluctuation evidencing a short circuit or other interruption of current.

(1) *Inspection procedure.* Insert a low range (0 to 25 amperes for most 2- and 4-brake systems and 0 to 40 amperes for a 6-brake system) d.c. ammeter into the brake circuit between the controller and the brakes. With the controller in the “off” position, the ammeter should read zero. Gradually apply the controller to the “full on” position for a brief period (not to exceed 1 minute) and observe the maximum ammeter reading. Gradually return the controller to “full off” and observe return to zero amperes. Divide the maximum ammeter reading by the number of brakes and determine the brake amperage value.

(b) Electric brake wiring condition. Electric brake wiring shall not be frayed. Wiring clips or brackets shall not be broken or missing. Terminal connections shall be clean. Conductor wire gauge shall not be below the brake manufacturer’s minimum recommendation.

(1) *Inspection procedure.* Examine visually for conditions specified.

§ 570.59 Service brake system.

(a) Service brake performance. Compliance with any one of the following performance criteria will satisfy the requirements of this section. Verify that tire inflation pressure is within the limits recommended by the vehicle manufacturer before conducting either of the following tests.

(1) Roller-type or drive-on platform tests. The force applied by the brake on a front wheel or a rear wheel shall not differ by more than 25 percent from the force applied by the brake on the other front wheel or the other rear wheel respectively.

(i) *Inspection procedure.* The vehicle shall be tested on a drive-on platform, or a roller-type brake analyzer with the capability of measuring equalization. The test shall be conducted in accordance with the test equipment manufacturer’s specifications. Note the brake force variance.

(2) Road test. The service brake system shall stop single unit vehicles, except truck-tractors, in a distance of not more than 35 feet, or combination vehicles and truck-tractors in a distance of not more than 40 feet, from a
§ 570.60  Steering system.

(a) System play. Lash or free play in the steering system shall not exceed the values shown in Table 2.

(1) Inspection procedure. Examine visually for conditions indicated.

<table>

</tr>
<tr>
<td>22</td>
<td>2 3/4</td>
</tr>
</tbody>
</table>

(b) Linkage play. Free play in the steering linkage shall not exceed the values shown in Table 3.

(1) Inspection procedure. Elevate the front end of the vehicle to load the ball joints, if the vehicle is so equipped. Ensure that wheel bearings are correctly adjusted. Grasp the front and rear of a tire and attempt to turn the tire and wheel assemble left and right. If the free movement at the front or rear tread of the tire exceeds the applicable value shown in Table 3, there is excessive steering linkage play.

</tbody>
</table>

(c) Free turning. Steering wheels shall turn freely through the limit of travel in both directions.

(1) Inspection procedure. With the engine running on a vehicle with power
steering, or the steerable wheels elevated on a vehicle without power steering, turn the steering wheel through the limit of travel in both directions. Feel for binding or jamming in the steering gear mechanism.

(d) **Alignment.** Toe-in or toe-out condition shall not be greater than 1.5 times the values listed in the vehicle manufacturer’s service specification for alignment setting.

(1) **Inspection procedure.** Drive the vehicle over a sideslip indicator or measure with a tread gauge, and verify that the toe-in or toe-out is not greater than 1.5 times the values listed in the vehicle manufacturer’s service specification.

(e) **Power steering system.** The power steering system shall not have cracked, frayed or slipping belts, chafed or abraded hoses, show signs of leakage or have insufficient fluid in the reservoir.

(1) **Inspection procedure.** Examine fluid reservoir, hoses and pump belts for the conditions indicated.

**Note:** Inspection of the suspension system must not precede the service brake performance test.

§ 570.61 Suspension system.

(a) **Suspension condition.** Ball joint seals shall not be cut or cracked, other than superficial surface cracks. Ball joints and kingpins shall not be bent or damaged. Stabilizer bars shall be connected. Springs shall not be broken and coil springs shall not be extended by spacers. Shock absorber mountings, shackles, and U-bolts shall be securely attached. Rubber bushings shall not be cracked, extruded out from or missing from suspension joints. Radius rods shall not be missing or damaged.

(1) **Inspection procedure.** Examine front and rear end suspension parts for the conditions indicated.

(b) **Shock absorber condition.** There shall be no oil on the shock absorber housings attributable to leakage by the seal.

(1) **Inspection procedure.** Examine shock absorbers for oil leakage from within.

§ 570.62 Tires.

(a) **Tread depth.** The tread shall be not less than four thirty-seconds of an inch deep on each front tire of any vehicle other than a trailer and not less than two thirty-seconds of an inch on all other tires.

(1) **Inspection procedure.** For tires with treadwear indicators, check for indicators in any two adjacent major grooves at three locations spaced approximately 120° apart around the circumference of the tire. For tires without treadwear indicators, measure the tread depth with a suitable gauge or scale in two adjacent major grooves at 3 locations spaced approximately 120° apart around the circumference of the tire at the area of greatest wear.

(b) **Type.** Vehicles should be equipped with tires on the same axle that are matched in construction and tire size designation, and dual tires shall be matched for overall diameter within one-half inch.

(1) **Inspection procedure.** Examine visually. A mismatch in size and construction between tires on the same axle, or a major deviation from the size recommended by the vehicle or tire manufacturer, is a cause for rejection. On a dual-tire arrangement the diameter of one of the duals must be within one-half inch of the other as measured by a gauge block inserted between the tire and a caliper.

(c) **General condition.** Tires shall be free from chunking, bumps, knots, or bulges evidencing cord, ply or tread separation from the casing.

(1) **Inspection procedure.** Examine visually for the conditions indicated.

(d) **Damage.** Tire cords or belting materials shall not be exposed, either to the naked eye or when cuts on the tire are probed. Reinforcement repairs to the cord body are allowable on tires other than front-mounted tires.

(1) **Inspection procedure.** Examine visually for the conditions indicated, using a blunt instrument if necessary to probe cuts and abrasions.

(e) **Special purpose tires.** Tires marked “Not For Highway Use” or “Farm Use Only” or other such restrictions shall not be used on any motor vehicles operating on public highways.

(1) **Inspection procedure.** Examine visually for tires labeled with specific restrictions.
§ 570.63 Wheel assemblies.

(a) Wheel integrity. A tire rim, wheel disc or spider shall have no visible cracks, elongated bolt holes, or indications of in-service repair by welding.

(1) Inspection procedure. Examine visually for the conditions indicated.

(b) Cast wheels. Cast wheels shall not be cracked or show evidence of excessive wear in the clamp area.

(1) Inspection procedure. Examine visually for the conditions indicated.

(c) Mounting. All wheel nuts shall be in place and tight.

(1) Inspection procedure. Check wheel retention for the conditions indicated.

PART 571—FEDERAL MOTOR VEHICLE SAFETY STANDARDS

Subpart A—General

Sec.
571.1 Scope.
571.3 Definitions.
571.4 Explanation of usage.
571.5 Matter incorporated by reference.
571.7 Applicability.
571.8 Effective date.
571.9 Separability.

Subpart B—Federal Motor Vehicle Safety Standards

571.101 Standard No. 101; Controls and displays.
571.102 Standard No. 102; Transmission shift position sequence, starter interlock, and transmission braking effect.
571.103 Standard No. 103; Windshield defrosting and defogging systems.
571.104 Standard No. 104; Windshield wiper and washing systems.
571.105 Standard No. 105; Hydraulic and electric brake systems.
571.106 Standard No. 106; Brake hoses.
571.107 [Reserved]
571.108 Standard No. 108; Lamps, reflective devices, and associated equipment.
571.109 Standard No. 109; New pneumatic and certain specialty tires.
571.110 Tire selection and rims and motor home/recreation vehicle trailer load carrying capacity information for motor vehicles with a GVWR of 4,536 kilograms (10,000 pounds) or less.
571.111 Standard No. 111; Rearview mirrors.
571.112 [Reserved]
571.113 Standard No. 113; Hood latch system.
571.114 Standard No. 114; Theft protection.
571.115 [Reserved]
571.116 Standard No. 116; Motor vehicle brake fluids.

49 CFR Ch. V (10–1–08 Edition)
571.117 Standard No. 117; Retreaded pneumatic tires.
571.118 Standard No. 118; Power-operated window, partition, and roof panel systems.
571.119 Standard No. 119; New pneumatic tires for motor vehicles with a GVWR of more than 4,536 kilograms (10,000 pounds) and motorcycles.
571.120 Tire selection and rims and motor home/recreation vehicle trailer load carrying capacity information for motor vehicles with a GVWR of more than 4,536 kilograms (10,000 pounds).
571.121 Standard No. 121; Air brake systems.
571.122 Standard No. 122; Motorcycle brake systems.
571.123 Standard No. 123; Motorcycle controls and displays.
571.124 Standard No. 124; Accelerator control systems.
571.125 Standard No. 125; Warning devices.
571.126 Standard No. 126; Electronic stability control systems.
571.127–571.128 [Reserved]
571.129 Standard No. 129; New non-pneumatic tires for passenger cars.
571.131 Standard No. 131; School bus pedestrian safety devices.
571.135 Standard No. 135; Light vehicle brake systems.
571.138 Standard No. 138; Tire pressure monitoring systems.
571.139 Standard No. 139; New pneumatic radial tires for light vehicles.
571.201 Standard No. 201; Occupant protection in interior impact.
571.202 Standard No. 202; Head restraints; Applicable at the manufacturers option until September 1, 2009.
571.202a Standard No. 202a; Head restraints; Mandatory applicability begins on September 1, 2009.
571.203 Standard No. 203; Impact protection for the driver from the steering control system.
571.204 Standard No. 204; Steering control rearward displacement.
571.205 Standard No. 205; Glazing materials.
571.205(a) Glazing equipment manufactured before September 1, 2006 and glazing materials used in vehicles manufactured before November 1, 2006.
571.206 Standard No. 206; Door locks and door retention components.
571.207 Standard No. 207; Seating systems.
571.208 Standard No. 208; Occupant crash protection.
571.209 Standard No. 209; Seat belt assemblies.
571.210 Standard No. 210; Seat belt assembly anchorages.
571.211 [Reserved]
Subpart A—General

§ 571.1 Scope.

occupied wheelchair during vehicle operation shall be regarded as four designated seating positions.

Driver means the occupant of a motor vehicle seated immediately behind the steering control system.

Emergency brake means a mechanism designed to stop a motor vehicle after a failure of the service brake system.

5th percentile adult female means a person possessing the dimensions and weight of the 5th percentile adult female specified for the total age group in Public Health Service Publication No. 1000, Series 11. No. 8, “Weight, Height, and Selected Body Dimensions of Adults.”

Firefighting vehicle means a vehicle designed exclusively for the purpose of fighting fires.

Fixed collision barrier means a flat, vertical, unyielding surface with the following characteristics:

1. The surface is sufficiently large that when struck by a tested vehicle, no portion of the vehicle projects or passes beyond the surface.

2. The approach is a horizontal surface that is large enough for the vehicle to attain a stable attitude during its approach to the barrier, and that does not restrict vehicle motion during impact.

3. When struck by a vehicle, the surface and its supporting structure absorb no significant portion of the vehicle’s kinetic energy, so that a performance requirement described in terms of impact with a fixed collision barrier must be met no matter how small an amount of energy is absorbed by the barrier.

Forward control means a configuration in which more than half of the engine length is rearward of the foremost point of the windshield base and the steering wheel hub is in the forward quarter of the vehicle length.

Full trailer means a trailer, except a pole trailer, that is equipped with two or more axles that support the entire weight of the trailer.

Gross axle weight rating or GAWR means the value specified by the vehicle manufacturer as the load-carrying capacity of a single axle system, as measured at the tire-ground interfaces. 

Gross combination weight rating or GCWR means the value specified by the manufacturer as the loaded weight of a combination vehicle.

Gross vehicle weight rating or GVWR means the value specified by the manufacturer as the loaded weight of a single vehicle.

H point means the mechanically hinged hip point of a manikin which simulates the actual pivot center of the human torso and thigh, described in SAE Recommended Practice J826, ‘‘Manikins for Use in Defining Vehicle Seating Accommodations,’’ November 1962.

Head impact area means all nonglazed surfaces of the interior of a vehicle that are statically contactable by a 6.5-inch diameter spherical head form of a measuring device having a pivot point to “top-of-head” dimension infinitely adjustable from 29 to 33 inches in accordance with the following procedure, or its graphic equivalent:

(a) At each designated seating position, place the pivot point of the measuring device—

(i) For seats that are adjustable fore and aft, at—

(ii) For seats that are not adjustable fore and aft, at the seating reference point.

(b) With the pivot point to “top-of-head” dimension at each value allowed by the device and the interior dimensions of the vehicle, determine all contact points above the lower windshield glass line and forward of the seating reference point.

(c) With the head form at each contact point, and with the device in a vertical position if no contact points exists for a particular adjusted length, pivot the measuring device forward and downward through all arcs in vertical planes to 90° each side of the vertical longitudinal plane through the seating reference point, until the head form contacts an interior surface or until it is tangent to a horizontal plane 1 inch above the seating reference point, whichever occurs first.
Interior compartment door means any door in the interior of the vehicle installed by the manufacturer as a cover for storage space normally used for personal effects.

Longitudinal or longitudinally means parallel to the longitudinal centerline of the vehicle.

Low-speed vehicle (LSV) means a motor vehicle,

(1) That is 4-wheeled,

(2) Whose speed attainable in 1.6 km (1 mile) is more than 32 kilometers per hour (20 miles per hour) and not more than 40 kilometers per hour (25 miles per hour) on a paved level surface, and

(3) Whose GVWR is less than 1,361 kilograms (3,000 pounds).

Motorcycle means a motor vehicle with motive power having a seat or saddle for the use of the rider and designed to travel on not more than three wheels in contact with the ground.

Motor-driven cycle means a motorcycle with a motor that produces 5-brake horsepower or less.

Motor home means a multi-purpose vehicle with motive power that is designed to provide temporary residential accommodations, as evidenced by the presence of at least four of the following facilities: cooking; refrigeration or ice box; self-contained toilet; heating and/or air conditioning; a potable water supply system including a faucet and a sink; and a separate 110–125 volt electrical power supply and/or propane.

Multifunction school activity bus (MFSAB) means a school bus whose purposes do not include transporting students to and from home or school bus stops.

Multipurpose passenger vehicle means a motor vehicle with motive power, except a low-speed vehicle or trailer, designed to carry 10 persons or less which is constructed either on a truck chassis or with special features for occasional off-road operation.

Open-body type vehicle means a vehicle having no occupant compartment top or an occupant compartment top that can be installed or removed by the user at his convenience.

Outboard designated seating position means a designated seating position where a longitudinal vertical plane tangent to the outboard side of the seat cushion is less than 12 inches from the innermost point on the inside surface of the vehicle at a height between the design H-point and the shoulder reference point (as shown in fig. 1 of Federal Motor Vehicle Safety Standard No. 210) and longitudinally between the front and rear edges of the seat cushion.

Overall vehicle width means the nominal design dimension of the widest part of the vehicle, exclusive of signal lamps, marker lamps, outside rearview mirrors, flexible fender extensions, and mud flaps, determined with doors and windows closed and the wheels in the straight-ahead position.

Parking brake means a mechanism designed to prevent the movement of a stationary motor vehicle.

Passenger car means a motor vehicle with motive power, except a low-speed vehicle, multipurpose passenger vehicle, motorcycle, or trailer, designed for carrying 10 persons or less.

Pelvic impact area means that area of the door or body side panel adjacent to any outboard designated seating position which is bounded by horizontal planes 7 inches above and 4 inches below the seating reference point and vertical transverse planes 8 inches forward and 2 inches rearward of the seating reference point.

Pole trailer means a motor vehicle without motive power designed to be drawn by another motor vehicle and attached to the towing vehicle by means of a reach or pole, or by being boomed or otherwise secured to the towing vehicle, for transporting long or irregularly shaped loads such as poles, pipes, or structural members capable generally of sustaining themselves as beams between the supporting connections.

Recreation vehicle trailer means a trailer, except a trailer designed primarily to transport cargo, designed to be drawn by a vehicle with motive power by means of a bumper, frame or fifth wheel hitch and designed to provide temporary residential accommodations, as evidenced by the presence of at least four of the following facilities: cooking; refrigeration or ice box; self-contained toilet; heating and/or air conditioning; a potable water supply system including a faucet and a
sink; and a separate 110–125 volt electrical power supply and/or propane. “Recreation vehicle trailer” includes trailers used for personal purposes, commonly known as “sport utility RVs” or “toy haulers,” which usually have spacious rather than incidental living quarters and provide a cargo area for smaller items for personal use such as motorcycles, mountain bikes, all terrain vehicles (ATVs), snowmobiles, canoes or other types of recreational gear.

*School bus* means a bus that is sold, or introduced in interstate commerce, for purposes that include carrying students to and from school or related events, but does not include a bus designed and sold for operation as a common carrier in urban transportation.

*Seating reference point* (SgRP) means the unique design H-point, as defined in SAE J1100 (June 1984), which:

(a) Establishes the rearmost normal design driving or riding position of each designated seating position, which includes consideration of all modes of adjustment, horizontal, vertical, and tilt, in a vehicle;

(b) Has X, Y, and Z coordinates, as defined in SAE J1100 (June 1984), established relative to the designed vehicle structure;

(c) Simulates the position of the pivot center of the human torso and thigh; and

(d) Is the reference point employed to position the two-dimensional drafting template with the 95th percentile leg described in SAE J826 (May 1987), or, if the drafting template with the 95th percentile leg cannot be positioned in the seating position, is located with the seat in its most rearward adjustment position.

*Semitrailer* means a trailer, except a pole trailer, so constructed that a substantial part of its weight rests upon or is carried by another motor vehicle.

*Service brake* means the primary mechanism designed to stop a motor vehicle.

*Speed attainable in 1 mile* means the speed attainable by accelerating at maximum rate from a standing start for 1 mile, on a level surface.

*Speed attainable in 2 miles* means the speed attainable by accelerating at maximum rate from a standing start for 2 miles, on a level surface.

*Torso line* means the line connecting the “H” point and the shoulder reference point as defined in SAE Recommended Practice J787g, “Motor Vehicle Seat Belt Anchorage,” September 1966.

*Trailer* means a motor vehicle with or without motive power, designed for carrying persons or property and for being drawn by another motor vehicle.

*Trailer converter dolly* means a trailer chassis equipped with one or more axles, a lower half of a fifth wheel and a drawbar.

*Truck* means a motor vehicle with motive power, except a trailer, designed primarily for the transportation of property or special purpose equipment.

*Truck tractor* means a truck designed primarily for drawing other motor vehicles and not so constructed as to carry a load other than a part of the weight of the vehicle and the load so drawn.

*Unloaded vehicle weight* means the weight of a vehicle with maximum capacity of all fluids necessary for operation of the vehicle, but without cargo, occupants, or accessories that are ordinarily removed from the vehicle when they are not in use.

*95th percentile adult male* means a person possessing the dimensions and weight of the 95th percentile adult male specified in Public Health Service Publication No. 1000, Series 11, No. 8, “Weight, Height, and Selected Body Dimensions of Adults.”

*Vehicle fuel tank capacity* means the tank’s unusable capacity (i.e., the volume of fuel left at the bottom of the tank when the vehicle’s fuel pump can no longer draw fuel from the tank) plus its usable capacity (i.e., the volume of fuel that can be pumped into the tank through the filler pipe with the vehicle on a level surface and with the unusable capacity already in the tank). The term does not include the vapor volume of the tank (i.e., the space above the fuel tank filler neck) nor the volume of the fuel tank filler neck.

EDITORIAL NOTE: For Federal Register citations affecting §571.3, see the List of CFR
§ 571.4 Explanation of usage.

The word any, used in connection with a range of values or set of items in the requirements, conditions, and procedures of the standards or regulations in this chapter, means generally the totality of the items or values, any one of which may be selected by the Administration for testing, except where clearly specified otherwise.

Examples: “The vehicle shall meet the requirements of §4.1 when tested at any point between 18 and 22 inches above the ground.” This means that the vehicle must be capable of meeting the specified requirements at every point between 18 and 22 inches above the ground. The test in question for a given vehicle may call for a single test (a single impact, for example), but the vehicle must meet the requirement at whatever point the Administration selects, within the specified range.

“Each tire shall be capable of meeting the requirements of this standard when mounted on any rim specified by the manufacturer as suitable for use with that tire.” This means that, where the manufacturer specifies more than one rim as suitable for use with a tire, the tire must meet the requirements with whatever rim the Administration selects from the specified group.

“Any one of the items listed below may, at the option of the manufacturer, be substituted for the hardware specified in §4.1.” Here the wording clearly indicates that the selection of items is at the manufacturer’s option.

§ 571.5 Matter incorporated by reference.

(a) Incorporation. There are hereby incorporated, by reference, into this part, all materials referred to in any standard in subpart B of this part that are not set forth in full in the standard. These materials are thereby made part of this regulation. The Director of the Federal Register has approved the materials incorporated by reference. For materials subject to change, only the specific version approved by the Director of the Federal Register and specified in the standard are incorporated. A notice of any change in these materials will be published in the Federal Register. As a convenience to the reader, the materials incorporated by reference are listed in the Finding Aid Table found at the end of this volume of the Code of Federal Regulations.

(b) Availability. The materials incorporated by reference, other than acts of Congress and matter published elsewhere in the Federal Register, are available as follows:

1. Standards of the Society of Automotive Engineers (SAE). They are published by the Society of Automotive Engineers, Inc. Information and copies may be obtained by writing to: Society of Automotive Engineers, Inc., 400 Commonwealth Drive, Warrendale, Pennsylvania 15096.

2. Standards of the American Society for Testing and Materials (ASTM). They are published by the American Society for Testing and Materials. Information and copies may be obtained by writing to: ASTM International, 100 Barr Harbor Drive, PO Box C700, West Conshohocken, PA 19428-2959.

3. Standards of the American National Standards Institute (ANSI). They are published by the American National Standards Institute. Information and copies may be obtained by writing to: RESNA, 1700 North Moore St., Suite 1540, Arlington, VA 22209-1903.

4. Data on the Weight Height and Selected Body Dimensions of Adults. They are published by the National Center for Health Statistics, Centers for Disease Control (CDC). Information and copies may be obtained on the CDC web site at http://www.cdc.gov/nchs or by writing to National Division for Health Statistics, Division of Data Services, Hyattsville, MD 20782-2003.

5. Test Methods of the American Association of Textile Chemists and Colorists (AATCC). They are published by the American Association of Textile Chemists and Colorists. Information and copies may be obtained by writing to: AATCC, 1 Davis Dr., P.O. Box 12215, Research Triangle Park, NC 27709.

6. Test methods of the Illuminating Engineering Society of North America (IES). They are published by the Illuminating Engineering Society of North America. Information and copies may be obtained by writing to: IES, 120 Wall St., 7th Floor, New York, NY 10005.

7. Standards of Suppliers of Advanced Composite Materials Association
§ 571.7 Applicability.

(a) General. Except as provided in paragraphs (c) and (d) of this section, each standard set forth in subpart B of this part applies according to its terms to all motor vehicles or items of motor vehicle equipment the manufacture of which is completed on or after the effective date of the standard.

(b) [Reserved]

(c) Military vehicles. No standard applies to a vehicle or item of equipment manufactured for, and sold directly to, the Armed Forces of the United States in conformity with contractual specifications.

(d) Export. No standard applies to a vehicle or item of equipment in the circumstances provided in section 108(b)(5) of the Act (15 U.S.C. 1397(b)(5)).

(e) Combining new and used components. When a new cab is used in the assembly of a truck, the truck will be considered newly manufactured for purposes of paragraph (a) of this section, the application of the requirements of this chapter, and the Act, unless the engine, transmission, and drive axle(s) (as a minimum) of the assembled vehicle are not new, and at least two of these components were taken from the same vehicle.

(f) Combining new and used components in trailer manufacture. When new materials are used in the assembly of a trailer, the trailer will be considered newly manufactured for purposes of paragraph (a) of this section, the application of the requirements of this chapter, and the Act, unless, at a minimum, the trailer running gear assembly (axle(s), wheels, braking and suspension) is not new, and was taken from an existing trailer—

1. Whose identity is continued in the reassembled vehicle with respect to the Vehicle Identification Number; and
2. That is owned or leased by the user of the reassembled vehicle.

§ 571.8 Effective date.

(a) Firefighting vehicles. Notwithstanding the effective date provisions...
Nat'l Highway Traffic Safety Admin., DOT § 571.101

of the motor vehicle safety standards in this part, the effective date of any standard or amendment of a standard issued after September 1, 1971, to which firefighting vehicles must conform shall be, with respect to such vehicles, either 2 years after the date on which such standard or amendment is published in the rules and regulations section of the Federal Register, or the effective date specified in the notice, whichever is later, except as such standard or amendment may otherwise specifically provide with respect to firefighting vehicles.

(b) Vehicles built in two or more stages vehicles and altered vehicles. Unless Congress directs or the agency expressly determines that this paragraph does not apply, the date for manufacturer certification of compliance with any standard, or amendment to a standard, that is issued on or after September 1, 2006 is, insofar as its application to intermediate and final-stage manufacturers and alterers is concerned, one year after the last applicable date for manufacturer certification of compliance. Nothing in this provision shall be construed as prohibiting earlier compliance with the standard or amendment or as precluding NHTSA from extending a compliance effective date for intermediate and final-stage manufacturers and alterers by more than one year.

[70 FR 7435, Feb. 14, 2005]

§ 571.9 Separability.

If any standard established in this part or its application to any person or circumstance is held invalid, the remainder of the part and the application of that standard to other persons or circumstances is not affected thereby.

Subpart B—Federal Motor Vehicle Safety Standards

Source: 36 FR 22902, Dec. 2, 1971, unless otherwise noted.

§ 571.101 Standard No. 101; Controls and displays.

S1. Scope. This standard specifies performance requirements for location, identification, color, and illumination of motor vehicle controls, telltales and indicators.

S2. Purpose. The purpose of this standard is to ensure the accessibility, visibility and recognition of motor vehicle controls, telltales and indicators, and to facilitate the proper selection of controls under daylight and nighttime conditions, in order to reduce the safety hazards caused by the diversion of the driver’s attention from the driving task, and by mistakes in selecting controls.

S3. Application. This standard applies to passenger cars, multipurpose passenger vehicles, trucks, and buses.

S4. Definitions.

Adjacent, with respect to a control, telltale or indicator, and its identifier means:
(a) The identifier is in close proximity to the control, telltale or indicator; and
(b) No other control, telltale, indicator, identifier or source of illumination appears between the identifier and the telltale, indicator, or control that the identifier identifies.

Common space means an area on which more than one telltale, indicator, identifier, or other message may be displayed, but not simultaneously.

Control means the hand-operated part of a device that enables the driver to change the state or functioning of the vehicle or a vehicle subsystem.

Indicator means a device that shows the magnitude of the physical characteristics that the instrument is designed to sense.

Identifier means a symbol, word, or words used to identify a control, telltale, or indicator.

Multi-function control means a control through which the driver may select, and affect the operation of, more than one vehicle function.

Multi-task display means a display on which more than one message can be shown simultaneously.

Telltale means an optical signal that, when illuminated, indicates the actuation of a device, a correct or improper functioning or condition, or a failure to function.

S5. Requirements. Each passenger car, multipurpose passenger vehicle, truck and bus that is fitted with a control, a telltale or an indicator listed in Table
1 or Table 2 must meet the requirements of this standard for the location, identification, color, and illumination of that control, telltale or indicator. However, the requirements for telltales and indicators do not apply to vehicles with GVWRs of 4,536 kg or greater if these specified vehicles are manufactured before September 1, 2013.

S5.1 Location

S5.1.1 The controls listed in Table 1 and in Table 2 must be located so they are operable by the driver under the conditions of S5.6.2.

S5.1.2 The telltales and indicators listed in Table 1 and Table 2 and their identification must be located so that, when activated, they are visible to a driver under the conditions of S5.6.1 and S5.6.2.

S5.1.3 Except as provided in S5.1.4, the identification for controls, telltales and indicators must be placed on or adjacent to the telltale, indicator or control that it identifies.

S5.1.4 The requirement of S5.1.3 does not apply to a multi-function control, provided the multi-function control is associated with a multi-task display that:

(a) Is visible to the driver under the conditions of S5.6.1 and S5.6.2,
(b) Identifies the multi-function control with which it is associated graphically or using words,
(c) For multi-task displays with layers, identifies on the top-most layer each system for which control is possible from the associated multi-function control, including systems not otherwise regulated by this standard. Subfunctions of the available systems need not be shown on the top-most layer of the multi-task display, and
(d) Identifies the controls of Table 1 and Table 2 with the identification specified in those tables or otherwise required by this standard, whenever those are the active functions of the multi-function control. For lower levels of multi-task displays with layers, identification is permitted but not required for systems not otherwise regulated by this standard.
(e) Does not display telltales listed in Table 1 or Table 2.

S5.2 Identification

S5.2.1 Except for the Low Tire Pressure Telltale, each control, telltale and indicator that is listed in column 1 of Table 1 or Table 2 must be identified by the symbol specified for it in column 2 or the word or abbreviation specified for it in column 3 of Table 1 or Table 2. If a symbol is used, each symbol provided pursuant to this paragraph must be substantially similar in form to the symbol as it appears in Table 1 or Table 2. The Low Tire Pressure Telltale (either the display identifying which tire has low pressure or the display which does not identify which tire has low pressure) shall be identified by the appropriate symbol designated in column 4, or both the symbol in column 4 and the words in column 3. No identification is required for any horn (i.e., audible warning signal) that is activated by a lanyard or for a turn signal control that is operated in a plane essentially parallel to the face plane of the steering wheel in its normal driving position and which is located on the left side of the steering column so that it is the control on that side of the column nearest to the steering wheel face plane.

S5.2.2 Any symbol, word, or abbreviation not shown in Table 1 or Table 2 may be used to identify a control, a telltale or an indicator that is not listed in those tables.

S5.2.3 Supplementary symbols, words, or abbreviations may be used at the manufacturer's discretion in conjunction with any symbol, word, or abbreviation specified in Table 1 or Table 2.

S5.2.4 [Reserved]

S5.2.5 A single symbol, word, or abbreviation may be used to identify any combination of the control, indicator, and telltale for the same function.

S5.2.6 Except as provided in S5.2.7, all identifications of telltales, indicators and controls listed in Table 1 or Table 2 must appear to the driver to be
perceptually upright. A rotating control that has an "off" position shall appear to the driver perceptually upright when the rotating control is in the "off" position.

§5.2.7 The identification of the following items need not appear to the driver to be perceptually upright:
(a) A horn control;
(b) Any control, telltale or indicator located on the steering wheel, when the steering wheel is positioned for the motor vehicle to travel in a direction other than straight forward; and
(c) Any rotating control that does not have an "off" position.

§5.2.8 Each control for an automatic vehicle speed system (cruise control) and each control for heating and air conditioning systems must have identification provided for each function of each such system.

§5.2.9 Each control that regulates a system function over a continuous range must have identification provided for the limits of the adjustment range of that function. If color coding is used to identify the limits of the adjustment range of a temperature function, the hot limit must be identified by the color red and the cold limit by the color blue. If the status or limit of a function is shown by a display not adjacent to the control for that function, both the control (unless it is a multi-function control complying with §5.1.4) and the display must be independently identified as to the function of the control, in compliance with §5.2.1, on or adjacent to the control and on or adjacent to the display.

Example 1. A slide lever controls the temperature of the air in the vehicle heating system over a continuous range, from no heat to maximum heat. Since the control regulates a single function over a quantitative range, only the extreme positions require identification.

Example 2. A switch has three positions, for heat, defrost, and air conditioning. Since each position regulates a different function, each position must be identified.

§5.3 Illumination

§5.3.1 Timing of illumination

(a) Except as provided in §5.3.1(c), the identifications of controls for which the word "Yes" is specified in column 5 of Table 1 must be capable of being illuminated whenever the headlamps are activated. This requirement does not apply to a control located on the floor, floor console, steering wheel, steering column, or in the area of windshield header, or to a control for a heating and air-conditioning system that does not direct air upon the windshield.

(b) Except as provided in §5.3.1(c), the indicators and their identifications for which the word "Yes" is specified in column 5 of Table 1 must be illuminated whenever the vehicle’s propulsion system and headlamps are activated.

(c) The indicators, their identifications and the identifications of controls need not be illuminated when the headlamps are being flashed or operated as daytime running lamps.

(d) At the manufacturer’s option, any control, indicator, or their identifications may be capable of being illuminated at any time.

(e) A telltale must not emit light except when identifying the malfunction or vehicle condition it is designed to indicate, or during a bulb check.

§5.3.2 Brightness of illumination of controls and indicators

§5.3.2.1 Means must be provided for illuminating the indicators, identifications of indicators and identifications of controls listed in Table 1 to make them visible to the driver under daylight and nighttime driving conditions.

§5.3.2.2 The means of providing the visibility required by §5.3.2.1:

(a) Must be adjustable to provide at least two levels of brightness;

(b) At a level of brightness other than the highest level, the identification of controls and indicators must be barely discernible to the driver who has adapted to dark ambient roadway condition;

(c) May be operable manually or automatically; and

(d) May have levels of brightness, other than the two required visible levels of brightness, at which those items and identification are not visible.

(1) If the level of brightness is adjusted by automatic means to a point where those items or their identification are not visible to the driver,
means shall be provided to enable the driver to restore visibility.

S5.3.3 Brightness of telltale illumination

(a) Means must be provided for illuminating telltales and their identification sufficiently to make them visible to the driver under daylight and nighttime driving conditions.

(b) The means for providing the required visibility may be adjustable manually or automatically, except that the telltales and identification for brakes, highbeams, turn signals, and safety belts may not be adjustable under any driving condition to a level that is invisible.

S5.3.4 Brightness of interior lamps. (a) Any source of illumination within the passenger compartment which is forward of a transverse vertical plane 110 mm rearward of the manikin “H” point with the driver’s seat in its rearmost driving position, which is not used for the controls and displays regulated by this standard, which is not a telltale, and which is capable of being illuminated while the vehicle is in motion, shall have either:

(1) Light intensity which is manually or automatically adjustable to provide at least two levels of brightness;

(2) A single intensity that is barely discernible to a driver who has adapted to dark ambient roadway conditions;

(3) A means of being turned off.

(b) Paragraph (a) of S5.3.4 does not apply to buses that are normally operated with the passenger compartment illuminated.

S5.3.5 The provisions of S5.3.4 do not apply to buses that are normally operated with the passenger compartment illuminated.

S5.4 Color

S5.4.1 The light of each telltale listed in Table 1 must be of the color specified for that telltale in column 6 of that table.

S5.4.2 Any indicator or telltale not listed in Table 1 and any identification of that indicator or telltale must not be a color that masks the driver’s ability to recognize any telltale, control, or indicator listed in Table 1.

S5.4.3 Each symbol used for the identification of a telltale, control or indicator must be in a color that stands out clearly against the background. For vehicles with a GVWR of under 4,536 kg (10,000 pounds), the compliance date for this provision is September 1, 2011.

S5.4.4 The filled-in part of any symbol in Table 1 or Table 2 may be replaced by its outline and the outline of any symbol in Table 1 or Table 2 may be filled in.

S5.5 Common space for displaying multiple messages

S5.5.1 A common space may be used to show messages from any sources, subject to the requirements in S5.5.2 through S5.5.6.

S5.5.2 The telltales for any brake system malfunction required by Table 1 to be red, air bag malfunction, low tire pressure, electronic stability control malfunction, passenger air bag off, high beam, turn signal, and seat belt must not be shown in the same common space.

S5.5.3 The telltales and indicators that are listed in Table 1 and are shown in the common space must illuminate at the initiation of any underlying condition.

S5.5.4 Except as provided in S5.5.5, when the underlying conditions exist for actuation of two or more telltales, the messages must be either:

(a) Repeated automatically in sequence, or

(b) Indicated by visible means and capable of being selected for viewing by the driver under the conditions of S5.6.2.

S5.5.5 In the case of the telltale for a brake system malfunction, air bag malfunction, side air bag malfunction, low tire pressure, electronic stability control malfunction, passenger air bag off, high beam, turn signal, or seat belt that is designed to display in a common space, that telltale must displace any other symbol or message in that common space while the underlying condition for the telltale’s activation exists.

S5.5.6(a) Except as provided in S5.5.6(b), messages displayed in a common space may be cancelable automatically or by the driver.
(b) Telltales for high beams, turn signal, low tire pressure, and passenger air bag off, and telltales for which the color red is required in Table 1 must not be cancelable while the underlying condition for their activation exists.

S5.6 Conditions

S5.6.1 The driver has adapted to the ambient light roadway conditions.

S5.6.2 The driver is restrained by the seat belts installed in accordance with 49 CFR 571.208 and adjusted in accordance with the vehicle manufacturer’s instructions.
## §571.101 49 CFR Ch. V (10–1–08 Edition)

Notes:
1. An identifier is shown in this table if it is required for a control for which an illumination requirement exists or if it is used for a telltale for which a color requirement exists. If a line appears in column 2 and column 3, the control, telltale or indicator is required to be identified, however the form of the identification is the manufacturer's option. Telltales are not considered to have an illumination requirement, because by definition the telltale must light when the condition for its activation exists.
2. Additional requirements in FMVSS 108.
3. Framed areas of the symbol may be solid; solid areas may be framed.
4. Blue may be blue-green. Red may be red-orange.
5. Symbols employing four lines instead of five may also be used.
6. The pair of arrows is a single symbol. When the controls or telltales for left and right turn operate independently, however, the two arrows may be considered separate symbols and be spaced accordingly.
7. Not required when arrows of turn signal telltales that otherwise operate independently flash simultaneously as hazard warning telltale.
8. Separate identification not required if function is combined with master lighting switch.
9. Refer to FMVSS 105 or FMVSS 135, as appropriate, for additional specific requirements for brake telltale labeling and color. If a single telltale is used to indicate more than one brake system condition, the brake system malfunction identifier must be used.
10. This symbol may also be used to indicate the malfunction of related systems/functions, including traction control, trailer stability assist, corner brake control, and other similar functions that use throttle and/or individual torque control to operate and share common components with ESC.
11. Combination of the engine oil pressure symbol and the engine coolant temperature symbol in a single telltale is permitted.
12. Use when engine control is separate from the key locking system.
13. If the speedometer is graduated in both miles per hour and in kilometers per hour, the scales must be identified “MPH” and “km/h”, respectively, in any combination of upper- and lowercase letters.
14. The letters 'P', 'R', 'N', and 'D' are considered separate identifiers for the individual gear positions. Their locations within the vehicle, and with respect to each other, are governed by FMVSS 102. The letter 'D' may be replaced by another alphanumeric character or symbol chosen by the manufacturer.
15. Required only for FMVSS 138 compliant vehicles.
16. Alternatively, either low tire pressure telltale may be used to indicate a TPMS malfunction. See FMVSS 138.
17. Required only for vehicles manufactured on or after September 1, 2007.

Notes:
1. An identifier is shown in this table if it is required for a control for which an illumination requirement exists or if it is used for a telltale for which a color requirement exists. If a line appears in column 2 and column 3, the control, telltale or indicator is required to be identified, however the form of the identification is the manufacturer's option. Telltales are not considered to have an illumination requirement, because by definition the telltale must light when the condition for its activation exists.
2. Additional requirements in FMVSS 108.
3. Framed areas of the symbol may be solid; solid areas may be framed.
4. Blue may be blue-green. Red may be red-orange.
5. Symbols employing four lines instead of five may also be used.
6. The pair of arrows is a single symbol. When the controls or telltales for left and right turn operate independently, however, the two arrows may be considered separate symbols and be spaced accordingly.
7. Not required when arrows of turn signal telltales that otherwise operate independently flash simultaneously as hazard warning telltale.
8. Separate identification not required if function is combined with master lighting switch.
9. Refer to FMVSS 105 or FMVSS 135, as appropriate, for additional specific requirements for brake telltale labeling and color. If a single telltale is used to indicate more than one brake system condition, the brake system malfunction identifier must be used.
11. This symbol may also be used to indicate the malfunction of related systems/functions, including traction control, trailer stability assist, corner brake control, and other similar functions that use throttle and/or individual wheel torque control to operate and share common components with ESC.
12. Combination of the engine oil pressure symbol and the engine coolant temperature symbol in a single telltale is permitted.
13. Use when engine control is separate from the key locking system.
14. If the speedometer is graduated in both miles per hour and in kilometers per hour, the scales must be identified "MPH" and "km/h", respectively, in any combination of upper- and lowercase letters.
15. The letters 'P', 'R', 'N', and 'D' are considered separate identifiers for the individual gear positions. Their locations within the vehicle, and with respect to each other, are governed by FMVSS 102. The letter 'D' may be replaced by another alphanumeric character or symbol chosen by the manufacturer.
16. Required only for FMVSS 138 compliant vehicles.
17. Alternatively, either low tire pressure telltale may be used to indicate a TPMS malfunction. See FMVSS 138.
18. Required only for vehicles manufactured on or after September 1, 2007.
§ 571.102 Standard No. 102; Transmission shift position sequence, starter interlock, and transmission braking effect.

S1. Purpose and scope. This standard specifies the requirements for the transmission shift position sequence, a starter interlock, and for a braking effect of automatic transmissions, to reduce the likelihood of shifting errors, to prevent starter engagement by the driver when the transmission is in any drive position, and to provide supplemental braking at speeds below 40 kilometers per hour (25 miles per hour).

S2. Application. This standard applies to passenger cars, multi-purpose passenger vehicles, trucks, and buses.

S3. Requirements.
S3.1 Automatic transmissions.
S3.1.1 Location of transmission shift positions on passenger cars. A neutral position shall be located between forward drive and reverse drive positions.
S3.1.1.1 Transmission shift levers. If a steering-column-mounted transmission shift lever is used, movement from neutral position to forward drive position shall be clockwise. If the transmission shift lever sequence includes a park position, it shall be located at the end, adjacent to the reverse drive position.
S3.1.2 Transmission braking effect. In vehicles having more than one forward transmission gear ratio, one forward drive position shall provide a greater degree of engine braking than the highest speed transmission ratio at vehicle speeds below 40 kilometers per hour (25 miles per hour).
S3.1.3 Starter interlock. Except as provided in S3.1.3.1 through S3.1.3.3, the engine starter shall be inoperative when the transmission shift position is in a forward or reverse drive position.
S3.1.3.1 After the driver has activated the vehicle’s propulsion system:
(a) The engine may stop and restart automatically when the transmission shift position is in any forward drive gear;
(b) The engine may not automatically stop when the transmission is in reverse gear; and
(c) The engine may automatically restart in reverse gear only if the vehicle satisfies (1) and (2):

(1) When the engine is automatically stopped in a forward drive shift position and the driver selects Reverse, the engine restarts immediately whenever the service brake is applied.
(2) When the engine is automatically stopped in a forward drive shift position and the driver selects Reverse, the engine does not start automatically if the service brake is not applied.

S3.1.3.2 Notwithstanding S3.1.3.1, the engine may stop and start at any time after the driver has activated the vehicle’s propulsion system if the vehicle can meet the requirements specified in paragraphs (a) and (b):
(a) For passenger cars, multi-purpose passenger vehicles, trucks and buses with a GVWR less than or equal to 4,536 kg (10,000 pounds), the vehicle’s propulsion system can propel the vehicle in the normal travel mode in all forward and reverse drive gears without the engine operating. For passenger cars, multipurpose passenger vehicles, trucks and buses with a GVWR greater than 4,536 kg (10,000 pounds), the vehicle’s propulsion system can propel the vehicle in the normal travel mode in Reverse and at least one forward drive gear without the engine operating.
(b) If the engine starts automatically while the vehicle is traveling at a steady speed and steady accelerator control setting, the engine does not cause the vehicle to accelerate.
S3.1.3.3 If the transmission shift position is in Park, automatically stopping or restarting the engine shall not take the transmission out of Park.
S3.1.4 Identification of shift positions and of shift position sequence.
S3.1.4.1 Except as specified in S3.1.4.3, if the transmission shift position sequence includes a park position, identification of shift positions, including the positions in relation to each other and the position selected, shall be displayed in view of the driver whenever any of the following conditions exist:
(a) The ignition is in a position where the transmission can be shifted; or
(b) The transmission is not in park.
S3.1.4.2 Except as specified in S3.1.4.3, if the transmission shift position sequence does not include a park
position, identification of shift positions, including the positions in relation to each other and the position selected, shall be displayed in view of the driver whenever the ignition is in a position in which the engine is capable of operation.

S3.1.4.3 Such information need not be displayed when the ignition is in a position that is used only to start the vehicle.

S3.1.4.4 All of the information required to be displayed by S3.1.4.1 or S3.1.4.2 shall be displayed in view of the driver in a single location. At the option of the manufacturer, redundant displays providing some or all of the information may be provided.

S3.2 Manual transmissions. Identification of the shift lever pattern of manual transmissions, except three forward speed manual transmissions having the standard “H” pattern, shall be displayed in view of the driver at all times when a driver is present in the driver’s seating position.

§ 571.103 Standard No. 103; Windshield defrosting and defogging systems.

S1. Scope. This standard specifies requirements for windshield defrosting and defogging systems.

S2. Application. This standard applies to passenger cars, multipurpose passenger vehicles, trucks, and buses.

S3. Definitions. Road load means the power output required to move a given motor vehicle at curb weight plus 180 kilograms on level, clean, dry, smooth portland cement concrete pavement (or other surface with equivalent coefficient of surface friction) at a specified speed through still air at 20 degrees Celsius, and standard barometric pressure (101.3 kilopascals) and includes driveline friction, rolling friction, and air resistance.

S4. Requirements. (a) Except as provided in paragraph (b) of this section, each passenger car shall meet the requirements specified in §4.1, §4.2, and §4.3, and each multipurpose passenger vehicle, truck, and bus shall meet the requirements specified in §4.1.

(b) Each passenger car, multipurpose passenger vehicle, truck, and bus manufactured for sale in the noncontiguous United States may, at the option of the manufacturer, have a windshield defogging system which operates either by applying heat to the windshield or by dehumidifying the air inside the passenger compartment of the vehicle, in lieu of meeting the requirements specified by paragraph (a) of this section.

S4.1 Each vehicle shall have a windshield defrosting and defogging system.

S4.2 Each passenger car windshield defrosting and defogging system shall meet the requirements of section 3 of SAE Recommended Practice J902, “Passenger Car Windshield Defrosting Systems,” August 1964, when tested in accordance with S4.3, except that “the critical area” specified in paragraph 3.1 of SAE Recommended Practice J902 shall be that established as Area C in accordance with Motor Vehicle Safety Standard No. 104, “Windshield Wiping and Washing Systems,” and “the entire windshield” specified in paragraph 3.3 of SAE Recommended Practice J902 shall be that established as Area A in accordance with §571.104.

S4.3 Demonstration procedure. The passenger car windshield defrosting and defogging system shall be tested in accordance with the portions of paragraphs 4.1 through 4.4.7 of SAE Recommended Practice J902, August 1964, or SAE Recommended Practice J902a, March 1967, applicable to that system, except that—

(a) During the first 5 minutes of the test:

(1) For a passenger car equipped with a heating system other than a heat exchanger type that uses the engine’s coolant as a means to supply the heat to the heat exchanger, the warm-up procedure is that specified by the vehicle’s manufacturer for cold weather starting, except that connection to a power or heat source external to the vehicle is not permitted.

(2) For all other passenger cars, the warm-up procedure may be that recommended by the vehicle’s manufacturer for cold weather starting.

(b) During the last 35 minutes of the test period (or the entire test period if the 5-minute warm-up procedure specified in paragraph (a) of this section is not used),
(1) For a passenger car equipped with a heating system other than a heat exchanger type that uses the engine’s coolant as a means to supply the heat to the heat exchanger, the procedure shall be that specified by the vehicle’s manufacturer for cold weather starting, except that connection to a power or heat source external to the vehicle is not permitted.

(2) For all other passenger cars, either—
   (i) The engine speed shall not exceed 1,500 r.p.m. in neutral gear; or
   (ii) The engine speed and load shall not exceed the speed and load at 40 kilometers per hour in the manufacturer’s recommended gear with road load;
   (c) A room air change of 90 times per hour is not required;
   (d) The windshield wipers may be used during the test if they are operated without manual assist;
   (e) One or two windows may be open a total of 25 millimeters;
   (f) The defroster blower may be turned on at any time; and
   (g) The wind velocity is at any level from 0 to 3 kilometers per hour.

(h) The test chamber temperature and the wind velocity shall be measured, after the engine has been started, at the forwardmost point of the vehicle or a point 914 millimeters from the base of the windshield, whichever is farther forward, at a level halfway between the top and bottom of the windshield on the vehicle centerline.

§ 571.104 Standard No. 104; Windshield wiping and washing systems.
S1. Scope. This standard specifies requirements for windshield wiping and washing systems.
S2. Application. This standard applies to passenger cars, multipurpose passenger vehicles, trucks, and buses.
S3. Definitions. The term seating reference point is substituted for the terms manikin H point, manikin H point with seat in rearmost position and H point wherever any of these terms appear in any SAE Standard or SAE Recommended Practice referred to in this standard.

Daylight opening means the maximum unobstructed opening through the glazing surface, as defined in paragraph 2.3.12 of section E, Ground Vehicle Practice, SAE Aerospace-Automotive Drawing Standards, September 1963.

Glazing surface reference line means the line resulting from the intersection of the glazing surface and a horizontal plane 635 millimeters above the seating reference point, as shown in Figure 1 of SAE Recommended Practice J903a, “Passenger Car Windshield Wiper Systems,” May 1966.

Overall width means the maximum overall body width dimension “W116”, as defined in section E, Ground Vehicle Practice, SAE Aerospace-Automotive Drawing Standards, September 1963.

Plan view reference line means—
   (a) For vehicles with bench-type seats, a line parallel to the vehicle longitudinal centerline outboard of the steering wheel centerline 0.15 times the difference between one-half of the shoulder room dimension and the steering wheel centerline-to-car-centerline dimension as shown in Figure 2 of SAE Recommended Practice J903a, May 1966; or
   (b) For vehicles with individual-type seats, either—
      (i) A line parallel to the vehicle longitudinal centerline which passes through the center of the driver’s designated seating position; or
      (ii) A line parallel to the vehicle longitudinal centerline located so that the geometric center of the 95 percent eye range contour is positioned on the longitudinal centerline of the driver’s designated seating position.

Shoulder room dimension means the front shoulder room dimension “W3” as defined in section E, Ground Vehicle Practice, SAE Aerospace-Automotive Drawing Standards, September 1963.

S4. Requirements.
S4.1 Windshield wiping system. Each vehicle shall have a power-driven windshield wiping system that meets the requirements of S4.1.1.
S4.1.1 Frequency.
§ 571.104

Each windshield wiping system shall have at least two frequencies or speeds.

One frequency or speed shall be at least 45 cycles per minute regardless of engine load and engine speed.

Regardless of engine speed and engine load, the highest and one lower frequency or speed shall differ by at least 15 cycles per minute. Such lower frequency or speed shall be at least 20 cycles per minute regardless of engine speed and engine load.

Compliance with subparagraphs S4.1.1.2 and S4.1.1.3 may be demonstrated by testing under the conditions specified in sections 4.1.1 and 4.1.2 of SAE Recommended Practice J903a, May 1966.

Wiped area. When tested wet in accordance with SAE Recommended Practice J903a, May 1966, each passenger car windshield wiping system shall wipe the percentage of Areas A, B, and C of the windshield (established in accordance with S4.1.2.1) that is specified in column 2 of the applicable table following subparagraph S4.1.2.1 and (2) is within the area bounded by a perimeter line on the glazing surface 25 millimeters from the edge of the day-light opening.

Areas A, B, and C shall be established as shown in Figures 1 and 2 of SAE Recommended Practice J903a, May 1966, using the angles specified in Columns 3 through 6 of Table I, II, III, or IV, as applicable.

| Table I—Passenger Cars of Less Than 1520 Millimeters in Overall Width |
|---|---|---|---|
| Column 1—Area | Column 2—Minimum percent to be wiped | Angles in degrees |
| | Column 3—Left | Column 4—Right | Column 5—Up | Column 6—Down |
| A | 80 | 16 | 49 | 7 | 5 |
| B | 94 | 13 | 46 | 4 | 3 |

| C | 99 | 10 | 15 | 5 | 1 |

Windshield washing system.

Each passenger car shall have a windshield washing system that meets the requirements of SAE Recommended Practice J942, "Passenger Car Windshield Washer Systems," November 1965, except that the reference to "the effective wipe pattern defined in SAE J903, paragraph 3.1.2" in paragraph 3.1 of SAE Recommended Practice J942 shall be deleted and "the areas established in accordance with subparagraph S4.1.2.1 of Motor Vehicle Safety Standard No. 104" shall be inserted in lieu thereof.

Each multipurpose passenger vehicle truck, and bus shall have a windshield washing system that meets the requirements of SAE Recommended Practice J942, November
1965, except that the reference to "the effective wipe pattern defined in SAE J903, paragraph 3.1.2" in paragraph 3.1 of SAE Recommended Practice J942 shall be deleted and "the pattern designed by the manufacturer for the windshield wiper system on the exterior surface of the windshield glazing" shall be inserted in lieu thereof.

§ 571.105 Standard No. 105; Hydraulic and electric brake systems.

S1. Scope. This standard specifies requirements for hydraulic and electric service brake systems, and associated parking brake systems.

S2. Purpose. The purpose of this standard is to insure safe braking performance under normal and emergency conditions.

S3. Application. This standard applies to multi-purpose passenger vehicles, trucks, and buses with a GVWR greater than 3,500 kilograms (7,716 pounds) that are equipped with hydraulic or electric brake systems.

S4. Definitions.

Antilock brake system or ABS means a portion of a service brake system that automatically controls the degree of rotational wheel slip during braking by:

(1) Sensing the rate of angular rotation of the wheels;

(2) Transmitting signals regarding the rate of wheel angular rotation to one or more controlling devices which interpret those signals and generate responsive controlling output signals; and

(3) Transmitting those controlling signals to one or more modulators which adjust brake actuating forces in response to those signals.

Backup system means a portion of a service brake system, such as a pump, that automatically supplies energy, in the event of a primary brake power source failure.

Brake power assist unit means a device installed in a hydraulic brake system that reduces the operator effort required to actuate the system, and that if inoperative does not prevent the operator from braking the vehicle by a continued application of muscular force on the service brake control.

Brake power unit means a device installed in a brake system that provides the energy required to actuate the brakes, either directly or indirectly through an auxiliary device, with the operator action consisting only of modulating the energy application level.

Directly Controlled Wheel means a wheel for which the degree of rotational wheel slip is sensed, either at that wheel or on the axle shaft for that wheel and corresponding signals are transmitted to one or more modulators that adjust the brake actuating forces at that wheel. Each modulator may also adjust the brake actuating forces at other wheels that are on the same axle or in the same axle set in response to the same signal or signals.

Electric vehicle or EV means a motor vehicle that is powered by an electric motor drawing current from rechargeable storage batteries, fuel cells, or other portable sources of electrical current, and which may include a non-electrical source of power designed to charge batteries and components thereof.

Electrically-actuated service brakes means service brakes that utilize electrical energy to actuate the foundation brakes.

Full brake application means a brake application in which the force on the brake pedal reaches 150 pounds within 0.3 seconds from the point of application of force to the brake control.

Hydraulic brake system means a system that uses hydraulic fluid as a medium for transmitting force from a service brake control to the service brake, and that may incorporate a brake power assist unit, or a brake power unit.

Indirectly Controlled Wheel means a wheel at which the degree of rotational wheel slip is not sensed, but at which the modulator of an antilock braking system adjusts its brake actuating forces in response to signals from one or more sensed wheels.

Initial brake temperature means the average temperature of the service brakes on the hottest axle of the vehicle 0.2 mi before any brake application.

Lightly loaded vehicle weight means:
(a) For vehicles with a GVWR of 10,000 lbs. or less, unloaded vehicle weight plus 400 lbs. (including driver and instrumentation);

(b) For vehicles with a GVWR greater than 10,000 lbs., unloaded vehicle weight plus 500 lbs. (including driver and instrumentation).

Maximum drive-through speed means the highest possible constant speed at which the vehicle can be driven through 200 feet of a 500-foot radius curve arc without leaving the 12-foot lane.

Parking mechanism means a component or subsystem of the drive train that locks the drive train when the transmission control is placed in a parking or other gear position and the ignition key is removed.

Peak friction coefficient or PFC means the ratio of the maximum value of braking test wheel longitudinal force to the simultaneous vertical force occurring prior to wheel lockup, as the braking torque is progressively increased.

Pressure component means a brake system component that contains the brake system fluid and controls or senses the fluid pressure.

Regenerative braking system or RBS means an electrical energy system that is installed in an EV for recovering or dissipating kinetic energy, and which uses the propulsion motor(s) as a retarder for partial braking of the EV while returning electrical energy to the propulsion batteries or dissipating electrical energy.

Skid number means the frictional resistance of a pavement measured in accordance with American Society for Testing and Materials (ASTM) Method E-276-70 (as revised July, 1974) at 40 mph, omitting water delivery as specified in paragraphs 7.1 and 7.2 of that method.

Snub means the braking deceleration of a vehicle from a higher reference speed to a lower reference speed that is greater than zero.

Spike stop means a stop resulting from the application of 200 lbs of force on the service brake control in 0.08 s.

Split service brake system means a brake system consisting of two or more subsystems actuated by a single control, designed so that a single failure in any subsystem (such as a leakage-type failure of a pressure component of a hydraulic subsystem except structural failure of a housing that is common to two or more subsystems, or an electrical failure in an electric subsystem) does not impair the operation of any other subsystem.

Stopping distance means the distance traveled by a vehicle from the point of application of force to the brake control to the point at which the vehicle reaches a full stop.

Tandem axle means a group of two or more axles placed in close arrangement one behind the other with the center lines of adjacent axles not more than 72 inches apart.

Variable proportioning brake system means a system that automatically adjusts the braking force at the axles to compensate for vehicle static axle loading and/or dynamic weight transfer between axles during deceleration.

Wheel lockup means 100 percent wheel slip.

§ S5.1 Service brake systems. Each vehicle must be equipped with a service brake system acting on all wheels. Wear of the service brake must be compensated for by means of a system of automatic adjustment. Each passenger car and each multipurpose passenger vehicle, truck, and bus with a GVWR of 10,000 pounds or less must be capable of meeting the requirements of S5.1.1 through S5.1.6 under the conditions prescribed in S6, when tested according to the procedures and in the sequence set forth in S7. Each school bus with a GVWR greater than 10,000 pounds must be capable of meeting the requirements of S5.1.1 through S5.1.5, and S5.1.7 under the conditions specified in S6, when tested according to the procedures and in the sequence set forth in S7. Each multipurpose passenger vehicle, truck and bus (other than a school bus) with a GVWR greater than 10,000 pounds must be capable of meeting the requirements of S5.1.1 through S5.1.5, and S5.1.3, and S5.1.7 under the conditions specified in S6, when tested according to the procedures and in the sequence set forth in S7. Except as noted in S5.1.1.2 and S5.1.1.4, if a vehicle is incapable of attaining a speed specified in §S5.1.1, S5.1.2, S5.1.3, or S5.1.6, its service
Brakes must be capable of stopping the vehicle from the multiple of 5 mph that is 4 to 8 mph less than the speed attainable in 2 miles, within distances that do not exceed the corresponding distances specified in Table II. If a vehicle is incapable of attaining a speed specified in §5.1.4 in the time or distance interval set forth, it must be tested at the highest speed attainable in the time or distance interval specified.

§5.1.1 Stopping distance. (a) The service brakes shall be capable of stopping each vehicle with a GVWR of less than 8,000 pounds, and each school bus with a GVWR between 8,000 pounds and 10,000 pounds in four effectiveness tests within the distances and from the speeds specified in §5.1.1.1, §5.1.1.2, §5.1.1.3, and §5.1.1.4.

(b) The service brakes shall be capable of stopping each vehicle with a GVWR of between 8,000 pounds and 10,000 pounds, other than a school bus, in three effectiveness tests within the distances and from the speeds specified in §5.1.1.1, §5.1.1.2, and §5.1.1.4.

(c) The service brakes shall be capable of stopping each vehicle with a GVWR greater than 10,000 pounds in two effectiveness tests within the distances and from the speeds specified in §5.1.1.1, §5.1.1.2, and §5.1.1.4.

§5.1.2 Partial failure. §5.1.2.1 In vehicles manufactured with a split service brake system, in the event of a rupture or leakage type of failure in a single subsystem, other than a structural failure of a housing that is common to two or more subsystems, the remaining portion(s) of the service brake system shall continue to operate and shall be capable of stopping a vehicle from 60 mph within the corresponding distance specified in column III of table II.

§5.1.1.1 In the first (preburnished) effectiveness test, the vehicle shall be capable of stopping from 30 mph and 60 mph within the corresponding distances specified in column I of table II. If the speed attainable in 2 miles is not less than 84 mph, a passenger car or other vehicle with a GVWR of 10,000 pounds or less shall also be capable of stopping from 80 mph within the corresponding distances specified in column II of table II.

S5.1.1.3 In the third effectiveness test the vehicle shall be capable of stopping at lightly loaded vehicle weight from 60 mph within the corresponding distance specified in column III of table II.

S5.1.1.4 In the fourth effectiveness test, a vehicle with a GVWR of 10,000 pounds or less shall be capable of stopping from 30 and 60 mph within the corresponding distances specified in column I of table II. If the speed attainable in 2 miles is not less than 84 mph, a passenger car, or other vehicle with a GVWR of 10,000 lbs., or less, shall also be capable of stopping from 80 mph within the corresponding distance specified in column I of table II.

If the speed attainable in 2 miles is not less than 99 mph, a passenger car shall, in addition, be capable of stopping from the applicable speed indicated below, within the corresponding distance specified in column I of table II.

<table>
<thead>
<tr>
<th>Speed attainable in 2 miles (mph)</th>

<tr>
<td>104 or more</td>
<td>100</td>
</tr>
</tbody>
</table>

For an EV, the speed attainable in 2 miles is determined with the propulsion batteries at a state of charge of not less than 95 percent at the beginning of the run.

§5.1.2 Partial failure. §5.1.2.1 In vehicles manufactured with a split service brake system, in the event of a rupture or leakage type of failure in a single subsystem, other than a structural failure of a housing that is common to two or more subsystems, the remaining portion(s) of the service brake system shall continue to operate and shall be capable of stopping a vehicle from 60 mph within...
the corresponding distance specified in column IV of table II.

S5.1.2.2 In vehicles not manufactured with a split service brake system, in the event of any one rupture or leakage type of failure in any component of the service brake system the vehicle shall, by operation of the service brake control, be capable of stopping 10 times consecutively from 60 mph within the corresponding distance specified in column IV of table II.

S5.1.2.3 For a vehicle manufactured with a service brake system in which the brake signal is transmitted electrically between the brake pedal and some or all of the foundation brakes, regardless of the means of actuation of the foundation brakes, the vehicle shall be capable of stopping from 60 mph within the corresponding distance specified in Column IV of Table II with any single failure in any circuit that electrically transmits the brake signal, and with all other systems intact.

S5.1.2.4 For an EV manufactured with a service brake system that incorporates RBS, the vehicle shall be capable of stopping from 60 mph within the corresponding distance specified in column IV of table II.

S5.1.3 Inoperative brake power assist unit or brake power unit. A vehicle equipped with one or more brake power assist units shall meet the requirements of either S5.1.3.1, S5.1.3.2, or S5.1.3.4 (chosen at the option of the manufacturer), and a vehicle equipped with one or more brake power units shall meet the requirements of either S5.1.3.1, S5.1.3.3, or S5.1.3.4 (chosen at the option of the manufacturer).

S5.1.3.1 The service brakes on a vehicle equipped with one or more brake power assist units or brake power units, with one such unit inoperative and depleted of all reserve capability, shall be capable of stopping a vehicle from 60 mph within the corresponding distance specified in column IV of table II.

S5.1.3.2 Brake power assist units. The service brakes on a vehicle equipped with one or more brake power assist units, with one such unit inoperative, shall be capable of stopping a vehicle from 60 mph:

(a) In six consecutive stops at an average deceleration for each stop that is not lower than that specified in column I of table III, when the inoperative unit is not initially depleted of all reserve capability; and

(b) In a final stop, at an average deceleration that is not lower than 7 FPSPS for passenger cars (equivalent stopping distance 554 feet) or 6 FPSPS for vehicles other than passenger cars (equivalent stopping distance 646 feet), as applicable, when the inoperative unit is depleted of all reserve capacity.

S5.1.3.3 Brake power units. The service brakes of a vehicle equipped with one or more brake power units with an accumulator-type reserve system, with any one failure in any unit shall be capable of stopping the vehicle from 60 mph:

(a) In 10 consecutive stops at an average deceleration for each stop that is not lower than that specified in column II of table III, when the unit is not initially depleted of all reserve capability; and

(b) In a final stop, at an average deceleration that is not lower than 7 FPSPS for passenger cars (equivalent stopping distance 554 feet) or 6 FPSPS for vehicles other than passenger cars (equivalent stopping distance 646 feet), as applicable, when the inoperative unit is depleted of all reserve capacity.

S5.1.3.4 Brake power assist and brake power units. The service brakes of a vehicle equipped with one or more brake power assist units or brake power units with a backup system, with one brake power assist unit or brake power unit inoperative and depleted of all reserve capability and with only the backup system operating in the failed subsystem, shall be capable of stopping the vehicle from 60 mph in 15 consecutive stops at an average deceleration for each stop that is not lower than 12 fpsps (equivalent stopping distance 323 feet).

S5.1.3.5 Electric brakes. Each vehicle with electrically-actuated service brakes (brake power unit) shall comply with the requirements of S5.1.3.1 with any single electrical failure in the electrically-actuated service brakes and all other systems intact.

S5.1.4 Fade and recovery. The service brakes shall be capable of stopping...
each vehicle in two fade and recovery tests as specified below.

S5.1.4.1 The control force used for the baseline check stops or snubs shall be not less than 10 pounds, nor more than 60 pounds, except that the control force for a vehicle with a GVWR of 10,000 pounds or more may be between 10 pounds and 90 pounds.

S5.1.4.2 (a) Each vehicle with GVWR of 10,000 lbs or less shall be capable of making 5 fade stops (10 fade stops on the second test) from 60 mph at a deceleration not lower than 15 fpsps for each stop, followed by 5 fade stops at the maximum deceleration attainable from 5 to 15 fpsps.

(b) Each vehicle with a GVWR greater than 10,000 pounds shall be capable of making 10 fade snubs (20 fade snubs on the second test) from 40 mph to 20 mph at 10 fpsps for each snub.

S5.1.4.3 (a) Each vehicle with a GVWR of 10,000 pounds or less shall be capable of making five recovery stops from 30 mph at 10 fpsps for each stop, with a control force application that falls within the following maximum and minimum limits:

1. A maximum for the first four recovery stops of 150 pounds, and for the fifth stop, of 20 pounds more than the average control force for the baseline check; and
2. A minimum of—
   (A) The average control force for the baseline check minus 10 pounds, or
   (B) The average control force for the baseline check times 0.60, whichever is lower (but in no case lower than 5 pounds).

(b) Each vehicle with a GVWR of more than 10,000 pounds shall be capable of making five recovery snubs from 30 mph at 10 fpsps for each snub, with a control force application that falls within the following maximum and minimum limits:

1. A maximum for the first four recovery snubs of 150 pounds, and for the fifth snub, of 20 pounds more than the average control force for the baseline check.
2. A minimum of—
   (A) The average control force for the baseline check minus 10 pounds, or
   (B) The average control force for the baseline check times 0.60, whichever is lower (but in no case lower than 5 pounds).

S5.1.5 Water recovery. The service brakes shall be capable of stopping each vehicle in a water recovery test, as specified below.

S5.1.5.1 The control force used for the baseline check stops or snubs shall be not less than 10 pounds, nor more than 60 pounds, except that the control force for a vehicle with a GVWR of 10,000 pounds or more may be between 10 and 90 pounds.

S5.1.5.2 (a) After being driven for 2 minutes at a speed of 5 mph in any combination of forward and reverse directions through a trough having a water dept of 6 inches, each vehicle with a GVWR of 10,000 pounds or less shall be capable of making five recovery stops from 30 mph at 10 fpsps for each stop with a control force application that falls within the following maximum and minimum limits:

1. A maximum for the first four recovery stops of 150 pounds, and for the fifth stop, of 45 pounds more than the average control force for the baseline check (but in no case more than 90 pounds, except that the maximum control force for the fifth stop in the case of a vehicle manufactured before September 1, 1976, shall be not more than plus 60 pounds of the average control force for the baseline check (but in no case more than 110 pounds).
2. A minimum of—
   (A) The average control force for the baseline check minus 10 pounds, or
   (B) The average control force for the baseline check times 0.60, whichever is lower (but in no case lower than 5 pounds).

(b) After being driven for 2 minutes at a speed of 5 mph in any combination of forward and reverse directions through a trough having a water depth of 6 inches, each vehicle with a GVWR of more than 10,000 pounds shall be capable of making five recovery stops from 30 mph at 10 fpsps for each stop with a control force application that falls within the following maximum and minimum limits:

1. A maximum for the first four recovery stops of 150 pounds, and for the fifth stop, of 60 pounds more than the average control force for the baseline check, whichever is lower (but in no case lower than 5 pounds).
check (but in no case more than 110 pounds); and
(2) A minimum of—
(A) The average control force for the baseline check minus 10 pounds, or
(B) The average control force for the baseline check times 0.60, whichever is lower (but in no case lower than 5 pounds).

S5.1.6 Spike stops. Each vehicle with a GVWR of 10,000 lbs. or less shall be capable of making 10 spike stops from 30 mph, followed by 6 effectiveness (check) stops from 60 mph, at least one of which shall be within a corresponding stopping distance specified in column I of table II.

S5.1.7 Stability and control during braking. When stopped four consecutive times under the conditions specified in §6, each vehicle with a GVWR greater than 10,000 pounds manufactured or after July 1, 2005 and each vehicle with a GVWR greater than 10,000 pounds manufactured in two or more stages on or after July 1, 2006 shall stop from 30 mph or 75 percent of the maximum drive-through speed, whichever is less, at least three times within the 12-foot lane, without any part of the vehicle leaving the roadway. Stop the vehicle with the vehicle at its lightly loaded vehicle weight, or at the manufacturer’s option, at its lightly loaded vehicle weight plus not more than an additional 1000 pounds for a roll bar structure on the vehicle.

S5.2 Parking Brake System. Each vehicle shall be manufactured with a parking brake system of a friction type with a solely mechanical means to retain engagement, which shall under the conditions of §6, when tested according to the procedures specified in §7, meet the requirements specified in §5.2.1, §5.2.2, or §5.2.3 as appropriate, with the system engaged—
(a) In the case of a vehicle with a GVWR of 4,536 kilograms (10,000 pounds) or less, with a force applied to the control not to exceed 125 pounds for a foot-operated system and 90 pounds for a hand-operated system; and
(b) In the case of a vehicle with a GVWR greater than 4,536 kilograms (10,000 pounds), with a force applied to the control not to exceed 150 pounds for a foot-operated system and 125 pounds for a hand-operated system.

S5.2.1. Except as provided in §5.2.2, the parking brake system on a passenger car and on a school bus with a GVWR of 10,000 pounds or less shall be capable of holding the vehicle stationary (to the limit of traction on the braked wheels) for 5 minutes in both a forward and reverse direction on a 30 percent grade.

S5.2.2 A vehicle of a type described in §5.2.1 at the option of the manufacturer may meet the requirements of §5.2.2.1, §5.2.2.2, and §5.2.2.3 instead of the requirements of §5.2.1 if:
(a) The vehicle has a transmission or transmission control which incorporates a parking mechanism, and
(b) The parking mechanism must be engaged before the ignition key can be removed.

S5.2.2.1 The vehicle’s parking brake and parking mechanism, when both are engaged, shall be capable of holding the vehicle stationary (to the limit of traction of the braked wheels) for 5 minutes, in both forward and reverse directions, on a 30 percent grade.

S5.2.2.2 The vehicle’s parking brake, with the parking mechanism not engaged, shall be capable of holding the vehicle stationary for 5 minutes, in both forward and reverse directions, on a 20 percent grade.

S5.2.2.3 With the parking mechanism engaged and the parking brake not engaged, the parking mechanism shall not disengage or fracture in a manner permitting vehicle movement, when the vehicle is impacted at each end, on a level surface, by a barrier moving at 2½ mph.

S5.2.3 (a) The parking brake system on a multipurpose passenger vehicle, truck or bus (other than a school bus) with a GVWR of 4,536 kilograms (10,000 pounds) or less shall be capable of holding the vehicle stationary for 5 minutes, in both forward and reverse directions, on a 20 percent grade.

(b) The parking brake system on a multipurpose passenger vehicle, truck, or bus (including a school bus) with a GVWR greater than 4,536 kilograms (10,000 pounds) shall be capable of holding the vehicle stationary for 5 minutes, in both forward and reverse directions, on a 20 percent grade.

S5.3 Brake system indicator lamp. Each vehicle shall have a brake system
An indicator lamp or lamps, mounted in front of and in clear view of the driver, which meet the requirements of §5.3.1 through §5.3.5. A vehicle with a GVWR of 10,000 pounds or less may have a single common indicator lamp. A vehicle with a GVWR of greater than 10,000 pounds may have an indicator lamp which is common for gross loss of pressure, drop in the level of brake fluid, or application of the parking brake, but shall have a separate indicator lamp for antilock brake system malfunction. However, the options provided in §5.3.1(a) shall not apply to a vehicle manufactured without a split service brake system; such a vehicle shall, to meet the requirements of §5.3.1(a), be equipped with a malfunction indicator that activates under the conditions specified in §5.3.1(a)(4). This warning indicator shall, instead of meeting the requirements of §5.3.2 through §5.3.5, activate (while the vehicle remains capable of meeting the requirements of §5.1.2.2 and the ignition switch is in the “on” position) a continuous or intermittent audible signal and a flashing warning light, displaying the words “STOP-BRAKE FAILURE” in block capital letters not less than one-quarter of an inch in height.

§5.3.1 An indicator lamp shall be activated when the ignition (start) switch is in the “on” (“run”) position and whenever any of the conditions (a) or (b), (c), (d), (e), (f), and (g) occur:

(a) A gross loss of pressure (such as caused by rupture of a brake line but not by a structural failure of a housing that is common to two or more sub-systems) due to one of the following conditions (chosen at the option of the manufacturer):

(1) Before or upon application of a differential pressure of not more than 225 lb/in² between the active and failed brake system measured at a master cylinder outlet or a slave cylinder outlet.

(2) Before or upon application of 50 pounds of control force upon a fully manual service brake.

(3) Before or upon application of 25 pounds of control force upon a service brake with a brake power assist unit.

(4) When the supply pressure in a brake power unit drops to a level not less than one-half of the normal system pressure.

(b) A drop in the level of brake fluid in any master cylinder reservoir compartment to less than the recommended safe level specified by the manufacturer or to one-fourth of the fluid capacity of that reservoir compartment, whichever is greater.

(c) A malfunction that affects the generation or transmission of response or control signals in an antilock brake system, or a total functional electrical failure in a variable proportioning brake system.

(d) Application of the parking brake.

(e) For a vehicle with electrically-actuated service brakes, failure of the source of electric power to the brakes, or diminution of state of charge of the batteries to less than a level specified by the manufacturer for the purpose of warning a driver of degraded brake performance.

(f) For a vehicle with electric transmission of the service brake control signal, failure of a brake control circuit.

(g) For an EV with RBS that is part of the service brake system, failure of the RBS.

§5.3.2 (a) Except as provided in paragraph (b) of this section, all indicator lamps shall be activated as a check of lamp function either when the ignition (start) switch is turned to the “on” (“run”) position when the engine is not running, or when the ignition (start) switch is in a position between “on” (run) and “start” that is designated by the manufacturer as a check position.

(b) The indicator lamps need not be activated when a starter interlock is in operation.

§5.3.3 (a) Each indicator lamp activated due to a condition specified in §5.3.1 shall remain activated as long as the malfunction exists, whenever the ignition (start) switch is in the “on” (run) position when the engine is not running, or when the ignition (start) switch is turned to the “off” position and the indicator lamp shall
be automatically reactivated when the ignition switch is again turned to the “on” position. The indicator lamp shall also be activated as a check of lamp function whenever the ignition is turned to the “on” (run) position. The indicator lamp shall be deactivated at the end of the check of lamp function unless there is a malfunction or a message about a malfunction that existed when the key switch was last turned to the “off” position.

S5.3.4 When an indicator lamp is activated it may be steady burning or flashing.

S5.3.5 (a) Each indicator lamp shall display word, words or abbreviation, in accordance with the requirements of Standard No. 101 (49 CFR 571.101) and/or this section, which shall have letters not less than 1/8-inch high and be legible to the driver in daylight when lighted. Words in addition to those required by Standard No. 101 and/or this section and symbols may be provided for purposes of clarity.

(b) If a single common indicator is used, the lamp shall display the word “Brake”. The letters and background of a single common indicator shall be of contrasting colors, one of which is red.

(c)(1) If separate indicators are used for one or more of the conditions described in S5.3.1(a) through S5.3.1(g) of this standard, the indicator display shall include the word “Brake” and appropriate additional labeling, except as provided in (c)(1) (A) through (D) of this paragraph.

(A) If a separate indicator lamp is provided for gross loss of pressure, the words “Brake Pressure” shall be used for S5.3.1(a).

(B) If a separate indicator lamp is provided for low brake fluid, the words “Brake Fluid” shall be used for S5.3.1(b), except for vehicles using hydraulic system mineral oil.

(C) If a separate indicator lamp is provided for an anti-lock system, the single word “Antilock” or “Anti-lock”, or the abbreviation “ABS”, may be used for S5.3.1(c).

(D) If a separate indicator lamp is provided for application of the parking brake, the single word “Park” may be used for S5.3.1(d).

(E) If a separate indicator is used for the regenerative brake system, the symbol “RBS” may be used. RBS failure may also be indicated by a lamp displaying the symbol “ABS/RBS.”

(2) Except for a separate indicator lamp for an anti-lock system, a regenerative system, or an indicator for both anti-lock and regenerative system, the letters and background of each separate indicator lamp shall be of contrasting colors, one of which is red. The letters and background of a separate lamp for an anti-lock system, a regenerative system, or a lamp displaying both an anti-lock and a regenerative system shall be of contrasting colors, one of which is yellow.

S5.4 Reservoirs.

S5.4.1 Master cylinder reservoirs. A master cylinder shall have a reservoir compartment for each service brake subsystem serviced by the master cylinder. Loss of fluid from one compartment shall not result in a complete loss of brake fluid from another compartment.

S5.4.2 Reservoir capacity. Reservoirs, whether for master cylinders or other type systems, shall have a total minimum capacity equivalent to the fluid displacement resulting when all the wheel cylinders or caliper pistons serviced by the reservoirs move from a new lining, fully retracted position (as adjusted initially to the manufacturer’s recommended setting) to a fully worn, fully applied position, as determined in accordance with S7.18(c) of this standard. Reservoirs shall have completely separate compartments for each subsystem except that in reservoir systems utilizing a portion of the reservoir for a common supply to two or more subsystems, individual partial compartments shall each have a minimum volume of fluid equal to at least the volume displaced by the master cylinder piston servicing the subsystem, during a full stroke of the piston. Each brake power unit reservoir servicing only the brake system shall have a minimum capacity equivalent to the fluid displacement required to charge the system piston(s) or accumulator(s) to normal operating pressure plus the displacement resulting when
all the wheel cylinders or caliper pistons serviced by the reservoir or accumulator(s) move from a new lining fully retracted position (as adjusted initially to the manufacturer’s recommended setting) to a fully worn, fully applied position.

S5.4.3 Reservoir labeling—Each vehicle equipped with hydraulic brakes shall have a brake fluid warning statement that reads as follows, in letters at least one-eighth of an inch high: “WARNING, Clean filler cap before removing. Use only fluid from a sealed container.” (Inserting the recommended type of brake fluid as specified in 49 CFR 571.116, e.g., “DOT 3”). The lettering shall be—

(a) Permanently affixed, engraved, or embossed;

(b) Located so as to be visible by direct view, either on or within 4 inches of the brake fluid reservoir filler plug or cap; and

(c) Of a color that contrasts with its background, if it is not engraved or embossed.

S5.5 Antilock and variable proportioning brake systems.

S5.5.1 Each vehicle with a GVWR greater than 10,000 pounds, except for any vehicle with a speed attainable in 2 miles of not more than 33 mph, shall be equipped with an antilock brake system that directly controls the wheels of at least one front axle and the wheels of at least one rear axle of the vehicle. On each vehicle with a GVWR greater than 10,000 pounds but not greater than 19,500 pounds and motor homes with a GVWR greater than 10,000 pounds but not greater than 22,500 pounds manufactured before March 1, 2001, the antilock brake system may also directly control the wheels of the rear drive axle by means of a single sensor in the driveline. Wheels on other axles of the vehicle may be indirectly controlled by the antilock brake system.

S5.5.2 In the event of any failure (structural or functional) in an antilock or variable proportioning brake system, the vehicle shall be capable of meeting the stopping distance requirements specified in §5.1.2 for service brake system partial failure. For an EV that is equipped with both ABS and RBS that is part of the service brake system, the ABS must control the RBS.

S5.6 Brake system integrity. Each vehicle shall be capable of completing all performance requirements of S5 without—

(a) Detachment or fracture of any component of the braking system, such as brake springs and brake shoe or disc pad facing, other than minor cracks that do not impair attachment of the friction facing. All mechanical components of the braking system shall be intact and functional. Friction facing tearout (complete detachment of lining) shall not exceed 10 percent of the lining on any single frictional element.

(b) Any visible brake fluid or lubricant on the friction surface of the brake, or leakage at the master cylinder or brake power unit reservoir cover, seal and filler openings.

S6 Test conditions. The performance requirements of S5 shall be met under the following conditions. Where a range of conditions is specified, the vehicle shall be capable of meeting the requirements at all points within the range. Compliance of vehicles manufactured in two or more stages may, at the option of the final-stage manufacturer, be demonstrated to comply with this standard by adherence to the instructions of the incomplete manufacturer provided with the vehicle in accordance with §568.4(a)(7)(ii) and §568.5 of title 49 of the Code of Federal Regulations.

S6.1 Vehicle weight.

S6.1.1 Other than tests specified at lightly loaded vehicle weight in S7.5(a), S7.7, S7.8, and S7.9, the vehicle is loaded to its GVWR such that the weight on each axle as measured at the tire-ground interface is in proportion to its GAWR, except that each fuel tank is filled to any level from 100 percent of capacity (corresponding to full GVWR) to 75 percent. However, if the weight on any axle of a vehicle at lightly loaded vehicle weight exceeds the axle’s proportional share of the gross vehicle weight rating, the load required to reach GVWR is placed so that the weight on that axle remains the same as a lightly loaded vehicle weight.

S6.1.2 For applicable tests specified in S7.5(a), S7.7, S7.8, and S7.9, vehicle weight is lightly loaded vehicle weight,
§ 571.105

with the added weight, except for the roll bar structure allowed for trucks and buses with a GVWR greater than 10,000 pounds, distributed in the front passenger seat area in passenger cars, multipurpose passenger vehicles, and trucks, and in the area adjacent to the driver’s seat in buses.

S6.2 Electric vehicles and electric brakes.

S6.2.1 The state of charge of the propulsion batteries is determined in accordance with SAE Recommended Practice J227a, Electric Vehicle Test Procedure, February 1976. The applicable sections of J227a are 3.2.1 through 3.2.4, 3.3.1 through 3.3.2.2, 3.4.1 and 3.4.2, 4.2.1, 5.2, 5.2.1, and 5.3.

S6.2.2 At the beginning of the first effectiveness test specified in S7.3, and at the beginning of each burnishing procedure, each EV’s propulsion battery is at the maximum state of charge recommended by the manufacturer, as stated in the vehicle operator’s manual or on a label that is permanently attached to the vehicle, or, if the manufacturer has made no recommendation, at a state of charge of not less than 95 percent. If batteries are replaced rather than recharged, each replacement battery shall be charged and measured for state of charge in accordance with these procedures. No further charging of any propulsion battery occurs during any of the performance tests in the test sequence of this standard. If the propulsion batteries are depleted during a test sequence such that the vehicle reaches automatic shut-down, will not accelerate, or the low state of charge warning lamp is illuminated, the vehicle is to be accelerated to brake test speed by auxiliary means.

S6.2.3 At the beginning of each performance test in the test sequence (S7.3, S7.5, S7.7 through S7.11, and S7.13 through S7.19 of this standard), unless otherwise specified, each propulsion battery of an EV is at the maximum state of charge recommended by the manufacturer, as stated in the vehicle operator’s manual or on a label that is permanently attached to the vehicle, or, if the manufacturer has made no recommendation, at a state of charge of not less than 95 percent. If batteries are replaced rather than recharged, each replacement battery shall be charged and measured for state of charge in accordance with these procedures. No further charging of any propulsion battery occurs during any of the performance tests in the test sequence of this standard. If the propulsion batteries are depleted during a test sequence such that the vehicle reaches automatic shut-down, will not accelerate, or the low state of charge warning lamp is illuminated, the vehicle is to be accelerated to brake test speed by auxiliary means.

S6.2.4 (a) For an EV equipped with RBS, the RBS is considered to be part of the service brake system if it is automatically controlled by an application of the service brake control, if there is no means provided for the driver to disconnect or otherwise deactivate it, and if it is activated in all transmission positions, including neutral. The RBS is operational during all burnishes and all tests, except for the test of a failed RBS.

(b) For an EV equipped with an RBS that is not part of the service brake system, the RBS is operational and set to produce the maximum regenerative braking effect during the burnishes, and is disabled during the test procedures. If the vehicle is equipped with a neutral gear that automatically disables the RBS, the test procedures which are designated to be conducted in gear may be conducted in neutral.

S6.2.5 For tests conducted “in neutral,” the operator of an EV with no “neutral” position (or other means such as a clutch for disconnecting the drive train from the propulsion motor(s)) does not apply any electromotive force to the propulsion motor(s). Any electromotive force that is applied to the propulsion motor(s) automatically remains in effect unless
otherwise specified by the test procedure.

S6.2.6 A vehicle equipped with electrically-actuated service brakes also performs the following test series. Conduct 10 stopping tests from a speed of 100 kph or the maximum vehicle speed, whichever is less. At least two of the 10 stopping distances must be less than or equal to 70 meters. The vehicle is loaded to GVWR for these tests and the transmission is in the neutral position when the service brake control is actuated and throughout the remainder of the test. The battery or batteries providing power to those electrically-actuated brakes, at the beginning of each test, shall be in a depleted state of charge for conditions (a), (b), or (c) of this paragraph as appropriate. An auxiliary means may be used to accelerate an EV to test speed.

(a) For an EV equipped with electrically-actuated service brakes deriving power from the propulsion batteries, and with automatic shut-down capability of the propulsion motor(s), the propulsion batteries are at not more than five percent above the EV actual automatic shut-down critical value. The critical value is determined by measuring the state-of-charge of each propulsion battery at the instant that automatic shut-down occurs and averaging the states-of-charge recorded.

(b) For an EV equipped with electrically-actuated service brakes deriving power from the propulsion batteries, and with no automatic shut-down capability of the propulsion motor(s), the propulsion batteries are at an average of not more than five percent above the actual state of charge at which the brake failure warning signal, required by S5.3.1(e) of this standard, is illuminated.

(c) For a vehicle which has an auxiliary battery (or batteries) that provides electrical energy to operate the electrically-actuated service brakes, the auxiliary battery(batteries) is (are) at (at an average of) not more than five percent above the actual state of charge at which the brake failure warning signal, required by S5.3.1(e) of this standard, is illuminated.

S6.3 Tire inflation pressure. Tire inflation pressure is the pressure recommended by the vehicle manufacturer for the GVWR of the vehicle.

S6.4 Transmission selector control. For S7.3, S7.5, S7.8, S7.15, S7.17, S7.11.1.2, S7.11.2.2, S7.11.3.2, and as required for S7.13, the transmission selector control is in neutral for all decelerations. For all other tests during all decelerations, the transmission selector is in the control position, other than overdrive, recommended by the manufacturer for driving on a level surface at the applicable test speed. To avoid engine stall during tests required to be run in gear a manual transmission may be shifted to neutral (or the clutch disengaged) when the vehicle speed decreases to 20 mph.

S6.5 Engine. Engine idle speed and ignition timing settings are according to the manufacturer’s recommendations. If the vehicle is equipped with an adjustable engine speed governor, it is adjusted according to the manufacturer’s recommendation.

S6.6 Vehicle openings. All vehicle openings (doors, windows, hood, trunk, convertible top, cargo doors, etc.) are closed except as required for instrumentation purposes.

S6.7 Ambient temperature. The ambient temperature is any temperature between 32 °F. and 100 °F.

S6.8 Wind velocity. The wind velocity is zero.

S6.9 Road surface.

S6.9.1 For vehicles with a GVWR of 10,000 pounds or less, road tests are conducted on a 12-foot-wide, level roadway, having a skid number of 81. Burnish stops are conducted on any surface. The parking brake test surface is clean, dry, smooth, Portland cement concrete.

S6.9.2(a) For vehicles with a GVWR greater than 10,000 pounds, road tests (excluding stability and control during braking tests) are conducted on a 12-foot-wide, level roadway, having a peak friction coefficient of 0.9 when measured using an American Society for Testing and Materials (ASTM) E 1136 standard reference test tire, in accordance with ASTM Method E 1337–90, at a speed of 40 mph, without water delivery. Burnish stops are conducted on any surface. The parking brake test surface is clean, dry, smooth, Portland cement concrete.
§ 571.105

S6.9.2(b) For vehicles with a GVWR greater than 10,000 pounds, stability and control during braking tests are conducted on a 500-foot-radius curved roadway with a wet level surface having a peak friction coefficient of 0.5 when measured on a straight or curved section of the curved roadway using an American Society for Testing and Materials (ASTM) E1136 standard reference tire, in accordance with ASTM Method E1337-90, at a speed of 40 mph, with water delivery.

S6.10 Vehicle position and wheel lock-up restrictions. The vehicle is aligned in the center of the roadway at the start of each brake application. Stops, other than spike stops, are made without any part of the vehicle leaving the roadway.

S6.10.1 For vehicles with a GVWR of 10,000 pounds or less, stops are made with wheel lockup permitted only as follows:
   (a) At vehicle speeds above 10 mph, there may be controlled wheel lockup on an antilock-equipped axle, and lock-up of not more than one wheel per vehicle, uncontrolled by an antilock system. (Dual wheels on one side of an axle are considered a single wheel.)
   (b) At vehicle speeds of 10 mph or less, any wheel may lock up for any duration.
   (c) Unlimited wheel lockup is allowed during spike stops (but not spike check stops), partial failure stops, and inoperative brake power or power assist unit stops.

S6.10.2 For vehicles with a GVWR greater than 10,000 pounds, stops are made with wheel lockup permitted only as follows:
   (a) At vehicle speeds above 20 mph, any wheel on a nonsteerable axle other than the two rearmost nonliftable, nonsteerable axles may lock up for any duration. The wheels on the two rearmost nonliftable, nonsteerable axles may lock up according to (b).
   (b) At vehicle speeds above 20 mph, one wheel on any axle or two wheels on any tandem may lock up for any duration.
   (c) At vehicle speeds above 20 mph, any wheel not permitted to lock in (a) or (b) may lock up repeatedly, with each lockup occurring for a duration of one second or less.
   (d) At vehicle speeds of 20 mph or less, any wheel may lock up for any duration.
   (e) Unlimited wheel lockup is allowed during partial failure stops, and inoperative brake power or power assist stops.

S6.11 Thermocouples. The brake temperature is measured by plug-type thermocouples installed in the approximate center of the facing length and width of the most heavily loaded shoe or disc pad, one per brake, as shown in figure 1. A second thermocouple may be installed at the beginning of the test sequence if the lining wear is expected to reach a point causing the first thermocouple to contact the metal rubbing surface of a drum or rotor. For centergrooved shoes or pads, thermocouples are installed within one-eighth of an inch to one-quarter inch of the groove and as close to the center as possible.

S6.12 Initial brake temperature. Unless otherwise specified the brake temperature is 150 °F to 200 °F.

S6.13 Control forces. Unless otherwise specified, the force applied to a brake control is not less than 15 lb and not more than 150 lb.

S6.14 Special drive conditions. A vehicle with a GVWR greater than 10,000 pounds equipped with an interlocking axle system or a front wheel drive system that is engaged and disengaged by the driver is tested with the system disengaged.

S6.15 Selection of compliance options. Where manufacturer options are specified, the manufacturer shall select the option by the time it certifies the vehicle and may not thereafter select a different option for the vehicle. Each manufacturer shall, upon request from the National Highway Traffic Safety Administration, provide information regarding which of the compliance options it has selected for a particular vehicle or make/model.

S7 Test procedure and sequence. Each vehicle shall be capable of meeting all the applicable requirements of S5 when tested according to the procedures and sequence set forth below, without replacing any brake system part or making any adjustments to the brake system other than as permitted.
in the burnish and reburnish procedures and in S7.9 and S7.10. (For vehicles only having to meet the requirements of S5.1.1, S5.1.2, S5.1.3, and S5.1.7 in section S5.1, the applicable test procedures and sequence are S7.1, S7.2, S7.4, S7.5(b), S7.5(a), S7.8, S7.9, S7.10, and S7.18. However, at the option of the manufacturer, the following test procedure and sequence may be conducted: S7.1, S7.2, S7.3, S7.4, S7.5(b), S7.6, S7.7, S7.5(a), S7.8, S7.9, S7.10, and S7.18. The choice of this option must not be construed as adding to the requirements specified in S5.1.2 and S5.1.3.) Automatic adjusters must remain activated at all times. A vehicle shall be deemed to comply with the stopping distance requirements of S5.1 if at least one of the stops at each speed and load specified in each of S7.3, S7.5(b), S7.8, S7.9, S7.10, S7.15 and S7.17 (check stops) is made within a stopping distance that does not exceed the corresponding distance specified in Table II. When the transmission selector control is required to be in neutral for a deceleration, a stop or snub must be obtained by the following procedures:

(a) Exceed the test speed by 4 to 8 mph;
(b) Close the throttle and coast in gear to approximately 2 mph above the test speed;
(c) Shift to neutral; and
(d) When the test speed is reached, apply the service brakes.

S7.1 Brake warming. If the initial brake temperature for the first stop in a test procedure (other than S7.7 and S7.16) has not been reached, heat the brakes to the initial brake temperature by making not more than 10 stops from not more than 40 to 10 mph at a deceleration not greater than 10 fpsps. The interval from the start of one service brake application to the start of the next shall be either the time necessary to reduce the initial brake temperature to between 230 °F. and 270 °F., or the distance of 1 mile, whichever occurs first. Accelerate to 40 mph after each stop and maintain that speed until making the next stop.

S7.1.2 Brake adjustment—post burnish. After burnishing, adjust the brakes in accordance with the manufacturer's published recommendations.

S7.4 Service brake system—burnish procedure.

S7.4.1 Vehicles with GVWR of 10,000 lb or less.

S7.4.1.1 Burnish. Burnish the brakes by making 200 stops from 40 mph at 12 fpsps (the 150 lb control force limit does not apply here). The interval from the start of one service brake application to the start of the next shall be either the time necessary to reduce the initial brake temperature to between 230 °F. and 270 °F., or the distance of 1 mile, whichever occurs first. Accelerate to 40 mph after each stop and maintain that speed until making the next stop.
neutral position, for the duration of each stop.

(b) Service brake system—second effectiveness test. For vehicles with a GVWR of 10,000 pounds or less, or any school bus, make six stops from 30 mph. Then, for any vehicle, make six stops from 60 mph. Then, for a vehicle with a GVWR of 10,000 pounds or less, make four stops from 80 mph if the speed attainable in 2 miles is not less than 84 mph.

S7.6 First reburnish. Repeat S7.4, except make 35 burnish stops or snubs. In the case of vehicles burnished in accordance with S7.4.2.1(a) of this section, reburnish the vehicle by making 35 snubs from 60 to 20 mph, but if the hottest brake temperature reaches 500 °F ±50 °F, make the remainder of the brake applications from the highest snub condition listed in Table IV that will maintain the hottest brake temperature at 500 °F ±50 °F. If at a snub condition of 40 to 20 mph, the temperature of the hottest brake exceeds 550 °F, make the remainder of the 35 brake applications from the snub condition without regard to brake temperature.

S7.7 Parking brake test. The parking brake tests for any vehicle on different grades, in different directions, and for different loads may be conducted in any order. The force required for actuation of a hand-operated brake system shall be measured at the center of the hand grip area or at a distance of 1½ inches from the end of the actuation lever, as illustrated in Figure II.

S7.7.1 Test procedure for requirements of S5.2.1 and S5.2.3.

S7.7.1.1 Condition the parking brake friction elements so that the temperature at the beginning of the test is at any level not more than 150 °F, (when the temperature of components on both ends of an axle are averaged).

S7.7.1.2 Drive the vehicle, loaded to GVWR, onto the specified grade with the longitudinal axis of the vehicle in the direction of the slope of the grade, stop the vehicle and hold it stationary by application of the service brake control, and place the transmission in neutral.

S7.7.1.3 With the vehicle held stationary by means of the service brake control, apply the parking brake by a single application of the force specified in (a), (b), or (c) of this paragraph, except that a series of applications to achieve the specified force may be made in the case of a parking brake system design that does not allow the application of the specified force in a single application:

(a) In the case of a passenger car or other vehicle with a GVWR of 10,000 lbs. or less, not more than 125 pounds for a foot-operated system, and not more than 90 pounds for a hand-operated system; and

(b) In the case of a vehicle with a GVWR greater than 4,536 kilograms (10,000 pounds) not more than 150 pounds for a foot-operated system, and not more than 125 pounds for a hand-operated system.

(c) For a vehicle using an electrically-activated parking brake, apply the parking brake by activating the parking brake control.

S7.7.1.4 Following the application of the parking brake in accordance with S7.7.1.3, release all force on the service brake control and commence the measurement of time if the vehicle remains stationary. If the vehicle does not remain stationary, reapplication of a force to the parking brake control at the level specified in S7.7.1.3 (a) or (b) as appropriate for the vehicle being tested (without release of the ratcheting or other holding mechanism of the parking brake) may be used twice to attain a stationary position.

S7.7.1.5 Following observation of the vehicle in a stationary condition for the specified time in one direction, repeat the same test procedure with the vehicle orientation in the opposite direction on the specified grade.

S7.7.1.6 Check the operation of the parking brake application indicator required by S5.3.1(d).

S7.7.2 Test procedure for requirements of S5.2.2 (a) Check that transmission must be placed in park position to release key;

(b) Test as in S7.7.1, except in addition place the transmission control to engage the parking mechanism; and

(c) Test as in S7.7.1 except on a 20 percent grade, with the parking mechanism not engaged.
§ 571.105

S7.7.3 Lightly loaded vehicle. Repeat S7.7.1 or S7.7.2 as applicable except with the vehicle at lightly loaded vehicles weight or at manufacturer’s option, for a vehicle with GVWR greater than 10,000 pounds, at lightly loaded vehicle weight plus not more than an additional 1,000 pounds for a roll bar structure on the vehicle.

S7.7.4 Non-service brake type parking brake systems. For vehicles with parking brake systems not utilizing the service brake friction elements, burnish the friction elements of such systems prior to parking brake tests according to the manufacturer’s published recommendations as furnished to the purchaser. If no recommendations are furnished, run the vehicle in an unburnished condition.

S7.8 Service brake system test—lightly loaded vehicle (third effectiveness) test. Make six stops from 60 mph with vehicle at lightly vehicle weight, or at the manufacturer’s option for a vehicle with GVWR greater than 10,000 pounds, at lightly loaded vehicle weight plus not more than an additional 1,000 pounds for a roll bar structure on the vehicle. (This test is not applicable to a vehicle which has a GVWR of not less than 7,716 pounds and not greater than 10,000 pounds and is not a school bus.)

S7.9 Service brake system test—partial failure.

S7.9.1 With the vehicle at lightly loaded vehicle weight or at the manufacturer’s option for a vehicle with a GVWR greater than 10,000 pounds, at lightly loaded vehicle weight plus not more than an additional 1,000 pounds for a roll bar structure on the vehicle, alter the service brake system to produce any one rupture or leakage type of failure, other than a structural failure of a housing that is common to two or more subsystems. Determine the control force, pressure level, or fluid level (as appropriate for the indicator being tested) necessary to activate the brake system indicator lamp. Make four stops if the vehicle is not so equipped, each from 60 mph, by a continuous application of the service brake control. Restore the service brake system to normal at completion of this test.

S7.9.2 Repeat S7.9.1 for each of the other subsystems.

S7.9.3 Repeat S7.9.1 and S7.9.2 with vehicle at GVWR. Restore the service brake system to normal at completion of this test.

S7.9.4 (For vehicles with antilock and/or variable proportioning brake systems.) With vehicle at GVWR, disconnect functional power source, or otherwise render antilock system inoperative. Disconnect variable proportioning brake system. Make four stops, each from 60 mph. If more than one antilock or variable proportioning brake subsystem is provided, disconnect or render one subsystem inoperative and run as above. Restore system to normal at completion of this test. Repeat for each subsystem provided.

Determine whether the brake system indicator lamp is activated when the electrical power source to the antilock or variable proportioning unit is disconnected.

S7.9.5 For a vehicle in which the brake signal is transmitted electrically between the brake pedal and some or all of the foundation brakes, regardless of the means of actuation of the foundation brakes, the tests in S7.9.1 through S7.9.3 of this standard are conducted by inducing any single failure in any circuit that electrically transmits the brake signal, and all other systems intact. Determine whether the brake system indicator lamp is activated when the failure is induced.

S7.9.6 For an EV with RBS that is part of the service brake system, the tests specified in S7.9.1 through S7.9.3 are conducted with the RBS disconnected and all other systems intact. Determine whether the brake system indicator lamp is activated when the RBS is disconnected.

S7.10 Service brake system—inoperative brake power unit or brake power assist unit test. (For vehicles equipped with brake power unit or brake power assist unit.)

S7.10.1 Regular procedure. (This test need not be run if the option in S7.10.2 is selected.) On vehicles with brake power assist units, render the brake power assist unit inoperative, or one of the brake power assist unit subsystems
if two or more subsystems are provided, by disconnecting the relevant power supply. Exhaust any residual brake power reserve capability of the disconnected system. On vehicles with brake power units, disconnect the primary source of power. Make four stops, each from 60 mph by a continuous application of the service brake control. Restore the system to normal at completion of this test. For vehicles equipped with more than one brake power unit or brake power assist unit, conduct tests of each in turn.

S7.10.2 Optional Procedures. On vehicles with brake power assist units, the unit is charged to maximum prior to start of test. (Engine may be run up in speed, then throttle closed quickly to attain maximum charge on vacuum assist units.) Brake power units shall also be charged to maximum accumulator pressure prior to start of test. No recharging is allowed after start of test.

(a) (For vehicles with brake power assist units.) Disconnect the primary source of power. Make six stops each from 60 mph, to achieve the average deceleration for each stop as specified in table III. Apply the brake control as quickly as possible. Maintain control force until vehicle has stopped. At the completion of the stops specified above, deplete the system of any residual brake power reserve capability. Make one stop from 60 mph at an average deceleration of not lower than 6 fpsps for each stop. Control force readings may be terminated when vehicle speed falls to 5 mph. Average the maximum brake control force required for the three stops.

(b) (For vehicles with brake power assist units.) Disconnect the primary source of power. Make six stops each from 60 mph, to achieve the average deceleration for each stop as specified in table III. Apply the brake control as quickly as possible. Maintain control force until vehicle has stopped. At the completion of the stops specified above, deplete the system of any residual brake power reserve capability. Make one stop from 60 mph at an average deceleration of not lower than 6 fpsps for each stop. Control force readings may be terminated when vehicle speed falls to 5 mph. Average the maximum brake control force required for the three stops.

S7.11 Service brake system—first fade and recovery test.

S7.11.1 Baseline check stops or snubs.

S7.11.1.1 Vehicles with GVWR of 10,000 lb or less. Make three stops from 30 mph at 10 fpsps for each stop. Control force readings may be terminated when vehicle speed falls to 5 mph. Average the maximum brake control force required for the three stops.

S7.11.1.2 Vehicles with GVWR greater than 10,000 pounds. With transmission in neutral (or declutched), make three stops from 40 to 20 mph at 10 fpsps for each stop. Average the maximum brake control force required for the three stops.

S7.11.2 Fade stops or snubs.

S7.11.2.1 Vehicles with GVWR of 10,000 pounds or less. Make five stops from 60 mph at 15 fpsps followed by 5 stops at the maximum attainable deceleration between 5 and 15 fpsps for each stop. Establish an initial brake temperature before the first brake application of 130° to 150 °F. Initial brake temperatures before brake applications for subsequent stops are those occurring at the distance intervals. Attain the required deceleration within 1 second and, as a minimum, maintain it for the remainder of the stopping time. Control force readings may be terminated...
when vehicle speed falls to 5 mph. Leave an interval of 0.4 mi between the start of brake applications. Accelerate immediately to the initial test speed after each stop. Drive for 1 mi at 30 mph after the last fade stop, and immediately follow the recovery procedure specified in §7.11.3.1.

§7.11.2.2 Vehicles with GVWR greater than 10,000 lb. With transmission in neutral (or declutched) make 10 snubs from 40 to 20 mph at 10 fpsps for each snub. Establish an initial brake temperature before the first brake application of 130 °F to 150 °F. Initial brake temperatures before brake application for subsequent snubs are those occurring in the time intervals specified below. Attain the required deceleration within 1 s and maintain it for the remainder of the snubbing time. Leave an interval of 30 s between snubs (start of brake application to start of brake application). Accelerate immediately to the initial test speed after each snub. Drive for 1.5 mi at 40 mph after the last snub and immediately follow the recovery procedure specified in §7.11.3.2.

§7.11.3 Recovery stops or snubs.

§7.11.3.1 Vehicles with GVWR of 10,000 lb or less. Make five stops from 30 mph at 10 fpsps for each stop. Control force readings may be terminated when vehicle speed falls to 5 mph. Allow a braking distance interval of 1 mi. Immediately after each stop accelerate at maximum rate to 30 mph and maintain that speed until making the next stop. Record the maximum control force for each stop.

§7.11.3.2 Vehicles with GVWR greater than 10,000 lb. With transmission in neutral (or declutched) make five snubs from 30 to 20 mph at 10 fpsps for each snub. After each snub, accelerate at maximum rate to 40 mph and maintain that speed until making the next brake application. Record the maximum control force for each snub.

§7.12 Service brake system—second reburnish. Repeat §7.6.

§7.13 Service brake system—second fade and recovery test. Repeat §7.11 except in §7.11.2 run 15 fade stops or 20 snubs instead of 10.

§7.15 Service brake system—fourth effectiveness test. Repeat §7.5. Then (for passenger cars) make four stops from either 95 mph if the speed attainable in 2 mi is 99 to (but not including) 104 mph, or 100 mph if the speed attainable in 2 mi is 104 mph or greater.

§7.16 Service brake system—water recovery test.

§7.16.1 Baseline check stop. Make three stops from 30 mph at 10 fpsps for each stop. Control force readings may be terminated when vehicle speed falls to 5 mph. Average the maximum brake control force required for the three stops.

§7.16.2 Wet brake recovery stops. With the brakes fully released at all times, drive the vehicle for 2 min at a speed of 5 mph in any combination of forward and reverse directions, through a trough having a water depth of 6 in. After leaving the trough, immediately accelerate at a maximum rate to 30 mph without a brake application. Immediately upon reaching that speed make five stops, each from 30 mph at 10 fpsps for each stop. After each stop (except the last), accelerate the vehicle immediately at a maximum rate to a speed of 30 mph and begin the next stop.

§7.17 Spike stops. Make 10 successive spike stops from 30 mph with the transmission in neutral, with no reverse stops. Make spike stops by applying a control force of 200 lb while recording control force versus time. Maintain control force until vehicle has stopped. At completion of 10 spike stops, make six effectiveness stops from 60 mph.

§7.18 Final inspection. Inspect—

(a) The service brake system for detachment or fracture of any components, such as brake springs and brake shoes or disc pad facing.

(b) The friction surface of the brake, the master cylinder or brake power unit reservoir cover and seal and filler openings, for leakage of brake fluid or lubricant.

(c) The master cylinder or brake power unit reservoir for compliance with the volume and labeling requirements of §5.4.2 and §5.4.3. In determining the fully applied worn condition assume that the lining is worn to: (1) Rivet or bolt heads on riveted or bolted linings, or (2) within one thirty-
§ 571.105

266

49 CFR Ch. V (10–1–08 Edition)

seconds of an inch of shoe or pad mounting surface on bonded linings, or
(3) the limit recommended by the manufacturer, whichever is larger relative to the total possible shoe or pad movement. Drums or rotors are assumed to be at nominal design drum diameter or rotor thickness. Linings are assumed adjusted for normal operating clearance in the released position.

(d) The brake system indicator light(s), for compliance with operation in various key positions, lens color, labeling, and location, in accordance with §5.3.

S7.19 Moving barrier test. (Only for vehicles that have been tested according to S7.7.2.) Load the vehicle to GVWR, release parking brake, and place the transmission selector control to engage the parking mechanism. With a moving barrier as described in paragraph 4.3 of SAE recommended practice J972 “Moving Barrier Collision Tests,” Nov. 1966 (revised May 2000), impact the vehicle from the front at 2 1/2 mph. This incorporation by reference was approved by the Director of the Federal Register in accordance with 5 U.S.C. 552(a) and 1 CFR part 51. Copies may be obtained from the Society of Automotive Engineers, Inc., 400 Commonwealth Drive, Warrendale, PA 15096–0001. Copies may be inspected at the National Highway Traffic Safety Administration, Technical Information Services, 400 Seventh Street, SW., Plaza Level, Room 403, Washington, DC 20590, or at the National Archives and Records Administration (NARA). For information on the availability of this material at NARA, call 202–741–6030, or go to: http://www.archives.gov/ federal_register/ code_of_federal_regulations/ibr_locations.html. Keep the longitudinal axis of the barrier parallel with the longitudinal axis of the vehicle. Repeat the test, impacting the vehicle from the rear.

NOTE: The vehicle used for this test need not be the same vehicle that has been used for the braking tests.

FIGURE 1—TYPICAL PLUG THERMOCouple INSTALLATIONS

NOTE: The second thermocouple shall be installed at .080 inch depth within 1 inch circumference of the thermocouple installed at .040 inch depth.

§ 571.106 Standard No. 106; Brake hoses.

S1. Scope. This standard specifies labeling and performance requirements for motor vehicle brake hose, brake hose assemblies, and brake hose end fittings.

S2. Purpose. The purpose of this standard is to reduce deaths and injuries occurring as a result of brake system failure from pressure or vacuum loss due to hose or hose assembly rupture.

S3. Application. This standard applies to passenger cars, multipurpose passenger vehicles, trucks, buses, trailers, and motorcycles, and to hydraulic, air, and vacuum brake hose, brake hose assemblies, and brake hose end fittings for use in those vehicles.

S4. Definitions.
Armor means protective material installed on a brake hose to increase the resistance of the hose or hose assembly to abrasion or impact damage.

Brake hose means a flexible conduit, other than a vacuum tubing connector, manufactured for use in a brake system to transmit or contain the fluid pressure or vacuum used to apply force to a vehicle's brakes. For hose, a dimensional description such as "1/4-inch hose" refers to the nominal inside diameter. For tubing, a dimensional description such as "1/4-in tubing" refers to the nominal outside diameter.

Brake hose assembly means a brake hose, with or without armor, equipped with end fittings for use in a brake system, but does not include an air or vacuum assembly prepared by the owner or operator of a used vehicle, by his employee, or by a repair facility, for installation in that used vehicle.

Brake hose end fitting means a coupler, other than a clamp, designed for attachment to the end of a brake hose.

Free length means the linear measurement of hose exposed between the end fittings of a hose assembly in a straight position.

Permanently attached end fitting means an end fitting that is attached by deformation of the fitting about the hose by crimping or swaging, or an end fitting that is attached by use of a sacrificial sleeve or ferrule that requires replacement each time a hose assembly is rebuilt.

Preformed means a brake hose that is manufactured with permanent bends and is shaped to fit a specific vehicle without further bending.

Rupture means any failure that results in separation of a brake hose from its end fitting or in leakage.

Vacuum tubing connector means a flexible conduit of vacuum that (i) connects metal tubing to metal tubing in a brake system, (ii) is attached without end fittings, and (iii) when installed, has an unsupported length less than the total length of those portions that cover the metal tubing.

§ 571.106

S5. Requirements—hydraulic brake hose, brake hose assemblies, and brake hose end fittings.

S5.1 Construction. (a) Each hydraulic brake hose assembly shall have permanently attached brake hose end fittings which are attached by deformation of the fitting about the hose by crimping or swaging.

(b) Each hydraulic brake hose assembly that is equipped with a permanent supplemental support integrally attached to the assembly and is manufactured as a replacement for use on a vehicle not equipped, as an integral part of the vehicle's original design, with a means of attaching the support to the vehicle shall be equipped with a bracket that is integrally attached to the supplemental support and that adapts the vehicle to properly accept this type of brake hose assembly.

S5.2 Labeling.

S5.2.1 Each hydraulic brake hose, except hose sold as part of a motor vehicle, shall have at least two clearly identifiable stripes of at least one-sixteenth of an inch in width, placed on opposite sides of the brake hose parallel to its longitudinal axis. One stripe may be interrupted by the information required by S5.2.2, and the other stripe may be interrupted by additional information at the manufacturer's option. However, hydraulic brake hose manufactured for use only in an assembly whose end fittings prevent its installation in a twisted orientation in either side of the vehicle, need not meet the requirements of S5.2.1.

S5.2.2 Each hydraulic brake hose shall be labeled, or cut from bulk hose that is labeled, at intervals of not more than 6 inches, measured from the end of one legend to the beginning of the next, in block capital letters and numerals at least one-eighth of an inch high, with the information listed in paragraphs (a) through (e) of this section. The information need not be present on hose that is sold as part of a brake hose assembly or a motor vehicle.

(a) The symbol DOT, constituting a certification by the hose manufacturer that the hose conforms to all applicable motor vehicle safety standards.

(b) A designation that identifies the manufacturer of the hose, which shall be filed in writing with: Office of Vehicle Safety Compliance, Equipment Division NVS–222, National Highway Traffic Safety Administration, 400 Seventh St. SW., Washington, DC 20590.
The marking may consist of a designation other than block capital letters required by S5.2.2.

(c) The month, day, and year, or the month and year, of manufacture, expressed in numerals. For example, 10/1/96 means October 1, 1996.

(d) The nominal inside diameter of the hose expressed in inches or fractions of inches, or in millimeters followed by the abbreviation "mm."

(e) Either "HR" to indicate that the hose is regular expansion hydraulic hose or "HL" to indicate that the hose is low expansion hydraulic hose.

S5.2.3 Package labeling for brake hose assemblies designed to be used with a supplemental support. (a) Each hydraulic brake hose assembly that is equipped with a permanent supplemental support integrally attached to the assembly and is manufactured as a replacement assembly for a vehicle equipped, as an integral part of the vehicle’s original design, with a means of attaching the support to the vehicle shall be sold in a package that is marked or labeled as follows: "FOR USE ON [insert Manufacturer, Model Name] ONLY;"

(b) Each hydraulic brake hose assembly that is equipped with a permanent supplemental support integrally attached to the assembly and is manufactured as a replacement for use on a vehicle not equipped, as an integral part of the vehicle’s original design, with a means of attaching the support to the vehicle shall comply with paragraphs (a)(1) and (2) of this section:

(1) Be sold in a package that is marked or labeled as follows: "FOR USE ONLY WITH A SUPPLEMENTAL SUPPORT."

(2) Be accompanied by clear, detailed instructions explaining the proper installation of the brake hose and the supplemental support bracket to the vehicle and the consequences of not attaching the supplemental support bracket to the vehicle. The instructions shall be printed on or included in the package specified in paragraph (a)(1) of this section.

S5.2.4 Each hydraulic brake hose assembly, except those sold as part of a motor vehicle, shall be labeled by means of a band around the brake hose assembly as specified in this paragraph or, at the option of the manufacturer, by means of labeling as specified in S5.2.4.1. The band may at the manufacturer’s option be attached so as to move freely along the length of the assembly, as long as it is retained by the end fittings. The band shall be etched, embossed, or stamped in block capital letters, numerals or symbols at least one-eighth of an inch high, with the following information:

(a) The symbol DOT constituting certification by the hose assembler that the hose assembly conforms to all applicable motor vehicle safety standards.

(b) A designation that identifies the manufacturer of the hose assembly, which shall be filed in writing with: Office of Vehicle Safety Compliance, Equipment Division NVS–222, National Highway Traffic Safety Administration, 400 Seventh St. SW., Washington, DC 20590. The designation may consist of block capital letters, numerals or a symbol.

S5.2.4.1 At least one end fitting of a hydraulic brake hose assembly shall be etched, stamped or embossed with a designation at least one-sixteenth of an inch high that identifies the manufacturer of the hose assembly and is filed in accordance with S5.2.4(b).

S5.3 Test requirements. A hydraulic brake hose assembly or appropriate part thereof shall be capable of meeting any of the requirements set forth under this heading, when tested under the conditions of S13 and the applicable procedures of S6. However, a particular hose assembly or appropriate part thereof need not meet further requirements after having been subjected to and having met the constriction requirement (S5.3.1) and any one of the requirements specified in S5.3.2 through S5.3.13.

S5.3.1 Constriction. Except for that part of an end fitting which does not contain hose, every inside diameter of any section of a hydraulic brake hose assembly shall be not less than 64 percent of the nominal inside diameter of the brake hose (S6.12).

S5.3.2 Expansion and burst strength. The maximum expansion of a hydraulic brake hose assembly at 1,000 psi, 1,500 psi and 2,900 psi shall not exceed the
values specified in Table I (S6.1), except that a brake hose larger than \( \frac{3}{16} \) inch or 5 mm is not subject to the 2,900 psi expansion test requirements. The hydraulic brake hose assembly shall then withstand water pressure of 4,000 psi for 2 minutes without rupture, and then shall not rupture at less than 7,000 psi for a \( \frac{1}{8} \) inch, 3 mm, or smaller diameter hose, or at less than 5,000 psi for a hose with a diameter larger than \( \frac{1}{8} \) inch or 3 mm (S6.2).

S5.3.3 **Whip resistance.** A hydraulic brake hose assembly shall not rupture when run continuously on a flexing machine for 35 hours (S6.3).

S5.3.4 **Tensile strength.** A hydraulic brake hose assembly shall withstand a pull of 325 pounds without separation of the hose from its end fittings during a slow pull test, and shall withstand a pull of 370 pounds without separation of the hose from its end fittings during a fast pull test (S6.4).

S5.3.5 **Water absorption and burst strength.** A hydraulic brake hose assembly, after immersion in water for 70 hours (S6.5), shall withstand water pressure of 4,000 psi for 2 minutes, and then shall not rupture at less than 5,000 psi (S6.2).

S5.3.6 **Water absorption and tensile strength.** A hydraulic brake hose assembly, after immersion in water for 70 hours (S6.5), shall withstand a pull of 325 pounds without separation of the hose from its end fittings during a slow pull test, and shall withstand a pull of 370 pounds without separation of the hose from its end fittings during a fast pull test (S6.4).

S5.3.7 **Water absorption and whip resistance.** A hydraulic brake hose assembly, after immersion in water for 70 hours (S6.5), shall not rupture when run continuously on a flexing machine for 35 hours (S6.3).

S5.3.8 **Low-temperature resistance.** A hydraulic brake hose conditioned at a temperature between minus 49 degrees Fahrenheit (minus 45 degrees Celsius) and minus 54 degrees Fahrenheit (minus 48 degrees Celsius) for 70 hours shall not show cracks visible without magnification when bent around a cylinder as specified in S6.6 (S6.6).
minutes and thereafter shall not rupture at less than 5,000 psi (§6.2 except all sizes of hose are tested at 5,000 psi).

§571.106

49 CFR Ch. V (10–1–08 Edition)

§ 571.106

§ 571.106 Ozone resistance. A hydraulic brake hose shall not show cracks visible under 7-power magnification after exposure to ozone for 70 hours at 104°F. (§6.8).

§5.3.12 High temperature impulse test. A brake hose assembly tested under the conditions in §6.10:

(a) Shall withstand pressure cycling for 150 cycles, at 295 degrees Fahrenheit (146 degrees Celsius) without leakage;

(b) Shall not rupture during a 2-minute, 4,000 psi pressure hold test, and;

(c) Shall not burst at a pressure less than 5,000 psi.

§5.3.13 End fitting corrosion resistance. After 24 hours of exposure to salt spray, a hydraulic brake hose end fitting shall show no base metal corrosion on the end fitting surface except where crimping or the application of labeling information has caused displacement of the protective coating (§6.11).

§6. Test procedures—Hydraulic brake hose, brake hose assemblies, and brake hose end fittings.

§6.1.1 Apparatus. Utilize a test apparatus (as shown in Figure 1) which consists of:

(a) Source for required fluid pressure;

(b) Test fluid of water without any additives and free of gases;

(c) Reservoir for test fluid;

(d) Pressure gauges;

(e) Brake hose end fittings in which to mount the hose vertically; and

(f) Graduate burette with 0.05 cc increments.

FIG. 1—EXPANSION TEST APPARATUS

S6.1.2 Preparation. (a) Measure the free length of the hose assembly.

(b) Mount the hose so that it is in a vertical straight position without tension when pressure is applied.

(c) Fill the hose with test fluid and bleed all gases from the system.

(d) Close the valve to the burette and apply 1,500 psi for 10 seconds; then release pressure.

S6.1.3 Calculation of expansion at 1,000 and 1,500 psi. (a) Adjust the fluid level in the burette to zero.

(b) Close the valve to the burette, apply pressure at the rate of 15,000 psi per minute, and seal 1,000 psi in the hose (1,500 psi in the second series, and 2,900 psi in the third series).

(c) After 3 seconds open the valve to the burette for 10 seconds and allow the fluid in the expanded hose to rise into the burette.

(d) Repeat the procedure in steps (b) and (c) twice. Measure the amount of test fluid which has accumulated in the burette as a result of the three applications of pressure.

(e) Calculate the volumetric expansion per foot by dividing the total accumulated test fluid by 3 and further dividing by the free length of the hose in feet.

§6.2 Burst strength test. (a) Connect the brake hose to a pressure system
(b) Apply water pressure of 4,000 psi at a rate of 15,000 psi per minute.
(c) After 2 minutes at 4,000 psi, increase the pressure at the rate of 15,000 psi per minute until the pressure exceeds 7,000 psi for a brake hose of 1/8 inch, 3 mm, or smaller diameter.

S6.3 Whip resistance test.

S6.3.1 Apparatus. Utilize test apparatus that is dynamically balanced and includes:
(a) A movable header consisting of a horizontal bar equipped with capped end fittings and mounted through bearings at each end to points 4 inches from the center of two vertically rotating disks whose edges are in the same vertical plane;
(b) An adjustable stationary header parallel to the movable header in the same horizontal plane as the centers of the disks, and fitted with open end fittings;
(c) An elapsed time indicator; and
(d) A source of water pressure connected to the open end fittings.

S6.3.2 Preparation. (a) Except for the supplemental support specified in S6.3.2(d), remove all external appendages including, but not limited to, hose armor, chafing collars, mounting brackets, date band and spring guards.
(b) Measure the hose free length.
(c) Mount the hose in the whip test machine, introducing slack as specified in Table II for the size hose tested, measuring the projected length parallel to the axis of the rotating disks. The manufacturer may, at his option, adapt the fitting attachment points to permit mounting hose assemblies equipped with angled or other special fittings in the same orientation as hose assemblies equipped with straight fittings.
(d) In the case of a brake hose assembly equipped with a permanent supplemental support integrally attached to the assembly, the assembly may be mounted using the supplemental support and associated means of simulating its attachment to the vehicle. Mount the supplemental support in the same vertical and horizontal planes as the stationary header end of the whip test fixture described in S6.3.1(b). Mount or attach the supplemental support so that it is positioned in accordance with the recommendation of the assembly manufacturer for attaching the supplemental support on a vehicle.

S6.3.3 Operation. (a) Apply 235 psi water pressure and bleed all gases from the system.
(b) Drive the movable head at 800 rpm.

S6.4 Tensile strength test. Utilize a tension testing machine conforming to the requirements of American Society for Testing and Materials (ASTM) E4-03, “Standard Practices for Force Verification of Testing Machines,” and provided with a recording device to measure the force applied. This incorporation by reference was approved by the Director of the Federal Register in accordance with 5 U.S.C. 552(a) and 1 CFR Part 51. Copies may be obtained from the American Society for Testing and Materials (ASTM) International, 100 Barr Harbor Drive, P.O. Box C700, West Conshohocken, PA 19428-2959. Copies may be inspected at the National Highway Traffic Safety Administration, Technical Information Services, 400 Seventh St., S.W., Plaza Level, Room 403, Washington, D.C. 20590, or at the National Archives and Records Administration (NARA). For information on the availability of this material at NARA, call 202-741-6030, or go to: http://www.archives.gov/federal_register/code_of_federal_regulations/ibr_locations.html.

S6.4.1 Preparation. Mount the hose assembly to ensure straight, evenly distributed machine pull.

S6.4.2 Operation. (a) Conduct the slow pull test by applying tension at a rate of 1 inch per minute travel of the moving head until separation occurs.
§ 571.106  

(b) Conduct the fast pull test by applying tension at a rate of 2 inches per minute travel of the moving head until separation occurs.

S6.5 Water absorption sequence tests.
(a) Prepare three brake hose assemblies and measure the free length of the hose assemblies.
(b) Immerse the brake hose assemblies in distilled water at 185 degrees Fahrenheit (85 degrees Celsius) for 70 hours. Remove the brake hose assemblies from the water and condition in air at room temperature for 30 minutes.
(c) Conduct the tests in S6.2, S6.3, and S6.4, using a different hose for each sequence.

S6.6 Low temperature resistance test.
S6.6.1 Preparation. (a) Remove hose armor, if any, and condition the hose in a straight position in air at a temperature between minus 49 degrees Fahrenheit and minus 54 degrees Fahrenheit (minus 45 degrees Celsius and minus 48 degrees Celsius) for 70 hours.
(b) Condition a cylinder in air at a temperature between minus 49 degrees Fahrenheit and minus 54 degrees Fahrenheit (minus 45 degrees Celsius and minus 48 degrees Celsius) for 70 hours, using a cylinder of 2½ inches in diameter for tests of hose less than ¼ inch or 3mm, 3 inches in diameter for tests of hose between ¼ inch and ¾ inch hose or 4 mm to 6 mm hose, and 4 inches in diameter for tests of hose greater than ¼ inch or 6 mm in diameter.

S6.6.2 Flexibility testing. Bend the conditioned hose 180 degrees around the conditioned cylinder at a steady rate in a period of 3 to 5 seconds. Examine without magnification for cracks.

S6.7 Brake fluid compatibility test.
S6.7.1 Preparation. (a) Attach a hose assembly below a 1-pint reservoir filled with 100 ml of SAE RM–66–04 Compatibility Fluid as shown in Figure 2. (SAE RM–66–03 Compatibility Fluid, as described in appendix A of SAE Standard J1703 NOV83, “Motor Vehicle Brake Fluid,” November 1983, may be used in place of SAE RM–66–04 until January 1, 1985.)
(b) Fill the hose assembly with brake fluid, seal the lower end, and place the test assembly in an oven in a vertical position.

S6.7.2 Oven treatment. (a) Condition the hose assembly at 200 °F. for 70 hours.
(b) Cool the hose assembly at room temperature for 30 minutes.
(c) Drain the brake hose assembly, immediately determine that every inside diameter of any section of the hose assembly, except for that part of an end fitting which does not contain hose, is not less than 64 percent of the nominal inside diameter of the hose, and conduct the test specified in S6.2.

S6.8 Ozone resistance test. Utilize a cylinder with a diameter eight times the nominal outside diameter of the brake hose excluding armor.
S6.8.1 Preparation. After removing any armor, bind a hydraulic brake hose 360° around the cylinder. In the case of hose shorter than the circumference of the cylinder, bend the hose so that as much of its length as possible is in contact.
S6.8.2 Exposure to ozone. (a) Condition the hose on the cylinder in air at room temperature for 24 hours.
(b) Immediately thereafter, condition the hose on the cylinder for 70 hours in...
an exposure chamber having an ambient air temperature of 104 degrees Fahrenheit (40 degrees Celsius) during the test and containing air mixed with ozone in the proportion of 100 parts of ozone per 100 million parts of air by volume.

(c) Examine the hose for cracks under 7-power magnification, ignoring areas immediately adjacent to or within the area covered by binding.

S6.9 End fitting corrosion resistance test. Utilize the apparatus described in ASTM B117-64, “Salt Spray (Fog) Testing”.

S6.9 Dynamic ozone test.

S6.9.1 Apparatus. Utilize a test apparatus shown in Figure 3 which is constructed so that:

(a) It has a fixed pin with a vertical orientation over which one end of the brake hose is installed.

(b) It has a movable pin that is oriented 30 degrees from vertical, with the top of the movable pin angled towards the fixed pin. The moveable pin maintains its orientation to the fixed pin throughout its travel in the horizontal plane. The other end of the brake hose is installed on the movable pin.

Figure 3. Dynamic Ozone Test Apparatus

S6.9.2 Preparation. (a) Precondition the hose assembly by laying it on a flat surface in an unstressed condition, at room temperature, for 24 hours.

(b) Cut the brake hose assembly to a length of 8.6 inches (218 mm), such that no end fittings remain on the cut hose.
§ 571.106

(c) Mount the brake hose onto the test fixture by fully inserting the fixture pins into each end of the hose. Secure the hose to the fixture pins using a band clamp at each end of the hose.

(d) Place the test fixture into an ozone chamber.

(e) Stabilize the atmosphere in the ozone chamber so that the ambient temperature is 104 °F (40 degrees Celsius) and the air mixture contains air mixed with ozone in the proportion of 100 parts of ozone per 100 million parts of air by volume. This atmosphere is to remain stable throughout the remainder of the test.

(f) Begin cycling the movable pin at a rate of 0.3 Hz. Continue the cycling for 48 hours.

(g) At the completion of 48 hours of cycling, remove the test fixture from the ozone chamber. Without removing the hose from the test fixture, visually examine the hose for cracks without magnification, ignoring areas immediately adjacent to or within the area covered by the band clamps. Examine the hose with the movable pin at any point along its travel.

S6.10 High temperature impulse test.

S6.10.1 Apparatus. (a) A pressure cycling machine to which one end of the brake hose assembly can be attached, with the entire hose assembly installed vertically inside of a circulating air oven. The machine shall be capable of increasing the pressure in the hose from zero psi to 1600 psi, and decreasing the pressure in the hose from 1600 psi to zero psi, within 2 seconds.

(b) A circulating air oven that can reach a temperature of 295 degrees Fahrenheit (146 degrees Celsius) within 30 minutes, and that can maintain a constant 295 degrees F (146 degrees Celsius) thereafter, with the brake hose assembly inside of the oven and attached to the pressure cycling machine.

(c) A burst test apparatus to conduct testing specified in S6.2.

S6.10.2 Preparation. (a) Connect one end of the hose assembly to the pressure cycling machine and plug the other end of the hose. Fill the pressure cycling machine and hose assembly with SAE RM–66–04 “Compatibility Fluid,” as described in Appendix B of SAE Standard J1703, revised JAN 1995, “Motor Vehicle Brake Fluid,” and bleed all gases from the system.

(b) Place the brake hose assembly inside of the circulating air oven in a vertical position. Increase the oven temperature to 296 degrees F (146 degrees Celsius) and maintain this temperature throughout the pressure cycling test.

(c) During each pressure cycle, the pressure in the hose is increased from zero psi to 1600 psi and held constant for 1 minute, then the pressure is decreased from 1600 psi to zero psi and held constant for 1 minute. Perform 150 pressure cycles on the brake hose assembly.

(d) Remove the brake hose assembly from the oven, disconnect it from the pressure cycling machine, and drain the fluid from the hose. Cool the brake hose assembly at room temperature for 45 minutes.

(e) Wipe the brake hose using acetone to remove residual Compatibility Fluid. Conduct the burst strength test in S6.2, except all sizes of hose are tested at 5,000 psi.

S6.11 End fitting corrosion test. Utilize the apparatus described in ASTM B117–03, “Standard Practice for Operating Salt Spray (Fog) Apparatus.” This incorporation by reference was approved by the Director of the Federal Register in accordance with 5 U.S.C. 552(a) and 1 CFR Part 51. Copies may be obtained from the American Society for Testing and Materials (ASTM) International, 100 Barr Harbor Drive, P.O. Box C700, West Conshohocken, PA 19428–2959. Copies may be inspected at the National Highway Traffic Safety Administration, Technical Information Services, 400 Seventh St., SW., Plaza Level, Room 403, Washington, DC 20590, or at the National Archives and Records Administration (NARA). For information on the availability of this material at NARA, call (202) 741–6030, or go to: http://www.archives.gov/federal_register/code_of_federal_regulations/ibr_locations.html.

S6.11.1 Construction. Construct the salt spray chamber so that:

(a) The construction material does not affect the corrosiveness of the fog.

(b) The hose assembly is supported or suspended 30 degrees from the vertical...
and parallel to the principal direction of the horizontal flow of fog through the chamber.

(c) The hose assembly does not contact any metallic material or any material capable of acting as a wick.
(d) Condensation which falls from the assembly does not return to the solution reservoir for respraying.
(e) Condensation from any source does not fall on the brake hose assemblies or the solution collectors.
(f) Spray from the nozzles is not directed onto the hose assembly.

S6.11.2 Preparation. (a) Plug each end of the hose assembly.
(b) Mix a salt solution five parts by weight of sodium chloride to 95 parts of distilled water, using sodium chloride substantially free of nickel and copper, and containing on a dry basis not more than 0.1 percent of sodium iodide and not more than 0.3 percent total impurities. Ensure that the solution is free of suspended solids before the solution is atomized.
(c) After atomization at 95 degrees Fahrenheit (35 degrees Celsius), ensure that the collected solution is in the pH range of 6.5 to 7.2. Make the pH measurements at 77 degrees Fahrenheit (28 degrees Celsius).
(d) Maintain a compressed air supply to the nozzle or nozzles free of oil and dirt and between 10 and 25 psi.

S6.11.3 Operation. Subject the brake hose assembly to the salt spray continuously for 24 hours.
(a) Regulate the mixture so that each collector will collect from 1 to 2 milliliters of solution per hour for each 80 square centimeters of horizontal collecting area.
(b) Maintain exposure zone temperature at 95 degrees Fahrenheit (35 degrees Celsius).
(c) Upon completion, remove the salt deposit from the surface of the hose by washing gently or dipping in clean running water not warmer than 100 degrees Fahrenheit (38 degrees Celsius) and then drying immediately.

S6.12.1 Plug gauge. (a) Utilize a plug gauge as shown in Figure 4. Diameter “A” is equal to 64 percent of the nominal inside diameter of the hydraulic brake hose being tested.
(b) Brake hose assemblies that are to be used for additional testing have constriction testing only at each end fitting. Other brake hose assemblies may be cut into 3-inch lengths to permit constriction testing of the entire assembly. Hose assemblies with end fittings that do not permit entry of the gauge (e.g., restrictive orifice or banjo fitting) are cut 3 inches from the point at which the hose terminates in the end fitting and then tested from the cut end.
(c) Hold the brake hose in a straight position and vertical orientation.
(d) Place the spherical end of the plug gauge just inside the hose or end fitting. If the spherical end will not enter the hose or end fitting using no more force than gravity acting on the plug gauge, this constitutes failure of the constriction test.
(e) Release the plug gauge. Within 3 seconds, the plug gauge shall fall under the force of gravity alone up to the handle of the gauge. If the plug gauge does not fully enter the hose up to the handle of the gauge within three seconds, this constitutes failure of the constriction test.

S6.12.2 Extended plug gauge. (a) The test in 6.12.1 may be conducted with an extended plug gauge to enable testing of the entire brake hose from one end fitting, without cutting the brake hose. The extended plug gauge weight and spherical diameter specifications are as shown in Figure 4, but the handle portion of the gauge may be deleted and the gauge length may be greater than 3 inches.
(b) The required performance of the extended plug gauge in S6.12.1(e) is that after the plug gauge is released, the extended plug gauge shall fall under the force of gravity alone at an average rate of 1 inch per second until the spherical diameter of the extended gauge passes through all portions of the brake hose assembly containing hose. If the extended plug gauge does not pass through all portions of the brake hose assembly containing hose at an average rate of 1 inch per second, this constitutes failure of the constriction test.
S6.12.3 Drop ball test. (a) Utilize a rigid spherical ball with a diameter equal to 64 percent of the nominal inside diameter of the hydraulic brake hose being tested. The weight of the spherical ball shall not exceed 2 ounces (57 grams).

(b) Hold the brake hose in a straight position and vertical orientation.

(c) Hold the ball just above the end fitting.

(d) Release the ball. The ball shall fall under the force of gravity alone completely through all portions of the brake hose assembly containing hose, at an average rate of 1 inch per second. Failure of the ball to pass completely through all portions of the brake hose assembly containing hose, at an average rate of 1 inch per second, constitutes failure of the constriction test.

S7. Requirements—Air brake hose, brake hose assemblies, and brake hose end fittings.

S7.1 Construction. Each air brake hose assembly shall be equipped with permanently attached brake hose end fittings or reusable brake hose end fittings. Each air brake hose constructed of synthetic or natural elastomeric rubber shall conform to the dimensional requirements specified in Table III, except for brake hose manufactured in metric sizes.

(1) Notes: Type A, sizes 3/8, 7/16, and 1/2 Special can be assembled with reusable end fittings. All sizes can be assembled using permanently-attached (crimped) end fittings.

(2) Types AI and AII, all sizes, can be assembled with reusable or permanently-attached (crimped) end fittings.

S7.2 Labeling
S7.2.1 Hose. Each air brake hose shall be labeled, or cut from bulk hose that is labeled, at intervals of not more than 6 inches, measured from the end of one legend to the beginning of the next, in block capital letters and numerals at least one-eighth of an inch high, with the information listed in paragraphs (a) through (e) of this section. The information need not be present on hose that is sold as part of a brake hose assembly or a motor vehicle.

(a) The symbol DOT, constituting a certification by the hose manufacturer that the hose conforms to all applicable motor vehicle safety standards.

(b) A designation that identifies the manufacturer of the hose, which shall be filed in writing with: Office of Vehicle Safety Compliance, Equipment Division NVS-222, National Highway Traffic Safety Administration, 400 Seventh St. SW., Washington, DC 20590. The designation may consist of block capital letters, numerals, or a symbol.

(c) The month, day, and year, or the month and year, of manufacture, expressed in numerals. For example, 10/1/96 means October 1, 1996.

(d) The nominal inside diameter of the hose expressed in inches or fractions of inches or in millimeters. The abbreviation “mm” shall follow hose sizes that are expressed in millimeters. (Examples: 3/8, 1/2 (1/2 SP in the case of 1/2 inch special air brake hose), 4mm, 6mm.)

(e) The type designation corresponding to the brake hose dimensions in Table III. Type A shall be labeled with the letter “A”, Type AI shall be labeled with the letter “AI”, and type AII shall be labeled with the
letters “AII”. Metric air brake hose shall be labeled with the letter “A.”

§ 571.106. Metric air brake hose shall be labeled with the letter “A.”

S7.2.2 End fittings. Except for an end fitting that is attached by deformation of the fitting about a hose by crimping or swaging, at least one component of each air brake hose fitting shall be etched, embossed, or stamped in block capital letters and numerals at least one-sixteenth of an inch high with the following information:

(a) The symbol DOT, constituting a certification by the manufacturer of that component that the component conforms to all applicable motor vehicle safety standards.

(b) A designation that identifies the manufacturer of that component of the fitting, which shall be filed in writing with: Office of Vehicle Safety Compliance, Equipment Division NVS–222, National Highway Traffic Safety Administration, 400 Seventh St. S.W., Washington, DC 20590. The designation may consist of block capital letters, numerals or a symbol.

(c) The letter “A” shall indicate intended use in air brake systems. In the case of an end fitting intended for use in a reusable assembly with brake hose subject to Table III, “AI” or “AII” shall indicate use with Type I or Type II hose, respectively.

(d) The nominal inside diameter of the hose to which the fitting is properly attached expressed in inches or fractions of inches or in millimeters. (See examples in S7.2.1 (d).) The abbreviation “mm” shall follow hose sizes that are expressed in millimeters.

S7.2.3 Assemblies. Each air brake hose assembly made with end fittings that are attached by crimping or swaging, except those sold as part of a motor vehicle, shall be labeled by means of a band around the brake hose assembly as specified in this paragraph or, at the option of the manufacturer, by means of labeling as specified in S7.2.3.1. The band may at the manufacturer’s option be attached so as to move freely along the length of the assembly, as long as it is retained by the end fittings. The band shall be etched, embossed, or stamped in block capital letters, numerals or symbols at least one-eighth of an inch high, with the following information:

(a) The symbol DOT, constituting certification by the hose assembler that the hose assembly conforms to all applicable motor vehicle safety standards.

(b) A designation that identifies the manufacturer of the hose assembly, which shall be filed in writing with: Office of Crash Avoidance Standards, Vehicle Dynamics Division, National Highway Traffic Safety Administration, 400 Seventh Street SW., Washington, DC 20590. The designation may consist of block capital letters, numerals or a symbol.

S7.2.3.1 At least one end fitting of an air brake hose assembly made with end fittings that are attached by crimping or swaging shall be etched, stamped or embossed with a designation at least one-sixteenth of an inch high that identifies the manufacturer of the hose assembly and is filed in accordance with S7.2.3(b).

S7.3 Test requirements. Each air brake hose assembly or appropriate part thereof shall be capable of meeting any of the requirements set forth under this heading, when tested under the conditions of S13 and the applicable procedures of S8. However, a particular hose assembly or appropriate part thereof need not meet further requirements after having met the construction requirement (S7.3.1) and then having been subjected to any one of the requirements specified in S7.3.2 through S7.3.13.

S7.3.1 Constriction. Every inside diameter of any section of an air brake hose assembly shall not be less than 66 percent of the nominal inside diameter of the brake hose. (S8.14)

S7.3.2 High temperature resistance. An air brake hose shall not show external or internal cracks, charring, or disintegration visible without magnification when straightened after being bent for 70 hours at 212 degrees Fahrenheit (100 degrees Celsius) over a small test cylinder having the radius specified in Table IV for the size of hose tested. (S8.1)

S7.3.3 Low temperature resistance. The inside and outside surfaces of an air brake hose shall not show cracks as a result of conditioning at minus 40 degrees Fahrenheit (minus 40 degrees Celsius) for 70 hours when bent around a
large test cylinder having the radius specified in Table IV for the size of hose tested (S8.2).

**Notes:**

1. These sizes are listed to provide test cylinder radii for brake hoses manufactured in these sizes. They do not represent conversions.
2. Small test cylinders are used for the high temperature resistance test.
3. Large test cylinders are used for the low temperature resistance, ozone resistance, and adhesion of wire-reinforced hose tests.

S7.3.4 Oil resistance. After immersion in ASTM No. 3 oil for 70 hours at 212 °F, the volume of a specimen prepared from the inner tube and cover of an air brake hose shall not increase more than 100 percent (S8.3).

S7.3.5 Ozone resistance. An air brake hose assembly shall not show cracks visible under 7-power magnification after exposure to ozone for 70 hours at 104 degrees Fahrenheit (40 degrees Celsius) when bent around a test cylinder of the radius specified in Table IV for the size of hose tested (S8.4).

S7.3.6 Length change. An air brake hose shall not contract in length more than 7 percent nor elongate more than 5 percent when subjected to air pressure of 200 psi (S8.5).

S7.3.7 Adhesion. (a) Except for hose reinforced by wire, an air brake hose shall withstand a tensile force of 8 pounds per inch of length before separation of adjacent layers (S8.6).

(b) An air brake hose reinforced by wire shall permit a steel ball to roll freely along the entire length of the inside of the hose when the hose is subjected to a vacuum of 25 inches of Hg and bent around a test cylinder (S8.13).

S7.3.8 Flex strength and air pressure leakage. An air brake hose assembly of the length specified in the table accompanying Figure 5, when subjected to a flex test and internal pressure cycling, shall be capable of having its internal pressure increased from zero to 140 psi within 2 minutes with pressurized air supplied through an orifice (S8.7).

S7.3.9 Corrosion resistance and burst strength. An air brake hose assembly exposed to salt spray shall not rupture when exposed to hydrostatic pressure of 900 psi (S8.8).

S7.3.10 Tensile strength. An air brake hose assembly designed for use between a frame and axle or between a towed and towing vehicle shall withstand, without separation of the hose from its end fittings, a pull of 250 pounds if it is ¼ inch, 6 mm, or less in nominal inside diameter, or a pull of 325 pounds if it is larger than ¼ inch or 6 mm in nominal inside diameter. An air brake hose assembly designed for use in any other application shall withstand, without separation of the hose from its end fittings, a pull of 50 pounds if it is ¼ inch, 6 mm, or less in nominal inside diameter, 150 pounds if it is larger than ¼ inch or 6 mm and equal to or smaller than ½ inch or 12 mm in nominal inside diameter, or 325 pounds if it is
larger than $\frac{1}{2}$ inch or 12 mm in nominal inside diameter (S8.9).

S7.3.11 Water absorption and tensile strength. After immersion in distilled water for 70 hours, an air brake hose assembly designed for use between a frame and axle or between a towed and a towing vehicle shall withstand, without separation of the hose from its end fittings, a pull of 250 pounds if it is $\frac{1}{4}$ inch or less or 6 mm or less in nominal inside diameter, or a pull of 325 pounds if it is larger than $\frac{1}{4}$ inch or 6 mm in nominal inside diameter. After immersion in distilled water for 70 hours, an air brake hose assembly designed for use in any other application shall withstand, without separation of the hose from its end fittings, a pull of 50 pounds if it is $\frac{1}{4}$ inch or 6 mm or less in nominal inside diameter, 150 pounds if it is larger than $\frac{1}{4}$ inch or 6 mm and equal to or smaller than $\frac{1}{2}$ inch or 12 mm in nominal inside diameter, or 325 pounds if it is larger than $\frac{1}{2}$ inch or 12 mm in nominal inside diameter. (S8.10)

S7.3.12 Zinc chloride resistance. The outer cover of an air brake hose shall not show cracks visible under 7-power magnification after immersion in a 50 percent zinc chloride aqueous solution for 200 hours (S8.11).

S7.3.13 End fitting corrosion resistance. After 24 hours of exposure to salt spray, air brake hose end fittings shall show no base metal corrosion on the end fitting surface except where crimping or the application of labeling information causes a displacement of the protective coating.

S8. Test procedures—Air brake hose, brake hose assemblies, and brake hose end fittings.

S8.1 High temperature resistance test.

(a) Utilize a small test cylinder with a radius specified in Table IV for the size of hose tested.

(b) Bind the hose around the cylinder and condition it in an air oven for 70 hours at 212 degrees Fahrenheit (100 degrees Celsius) and then cool in ASTM IRM 903 oil at room temperature for 30 to 60 minutes.

(c) Dip the specimen quickly in acetone and blot it lightly with filter paper.

(d) Weigh each specimen in a tared weighing bottle (W3) and in distilled water (W4) within five minutes of removal from the cooling liquid.

(e) Calculate the percentage increase in volume follows:

\[
\text{Percent of increase}=\frac{[W_4 - W_d] - (W_1 - W_2)}{(W_1 - W_2)}\times100
\]
§ 571.106

S8.4 Ozone resistance test. Conduct the test specified in S6.8, using air brake hose, except use the large test cylinder specified in Table IV for the size of hose tested.

S8.5 Length change test. (a) Position a test hose in a straight, horizontal position, and apply air pressure of 10 psi thereto.

(b) Measure the hose to determine original free length.

(c) Without releasing the 10 psi, raise the air pressure to the test hose to 200 psi.

(d) Measure the hose under 200 psi to determine final free length. An elongation or contraction is an increase or decrease, respectively, in the final free length from the original free length of the hose.

S8.6 Adhesion test for air brake hose not reinforced by wire.

S8.6.1 Apparatus. A tension testing machine that is power-driven and that applies a constant rate of extension is used for measuring the force required to separate the layers of the test specimen. The apparatus is constructed so that:

(a) The recording head includes a freely rotating form with an outside diameter substantially the same as the inside diameter of the hose specimen to be placed on it.

(b) The freely rotating form is mounted so that its axis of rotation is in the plane of the ply being separated from the specimen and so that the applied force is perpendicular to the tangent of the specimen circumference at the line of separation.

(c) The rate of travel of the power-actuated grip is a uniform one inch per minute and the capacity of the machine is such that maximum applied tension during the test is not more than 85 percent nor less than 15 percent of the machine’s rated capacity.

(d) The machine produces a chart with separation as one coordinate and applied tension as the other.

S8.6.2 Preparation. (a) Cut a test specimen of 1 inch or more in length from the hose to be tested and cut the layer to be tested of that test specimen longitudinally along its entire length to the level of contact with the adjacent layer.

(b) Peel the layer to be tested from the adjacent layer to create a flap large enough to permit attachment of the power-actuated clamp of the apparatus.

(c) Mount the test specimen on the freely rotating form with the separated layer attached to the power-actuated clamp.

S8.6.3 [Reserved]

S8.6.4 Calculations. (a) The adhesion value shall be the minimum force recorded on the chart excluding that portion of the chart which corresponds to the initial and final 20 percent portion along the displacement axis.

(b) Express the force in pounds per inch of length.

S8.7 Flex strength and air pressure test.

S8.7.1 Apparatus. A flex testing machine with a fixed hose assembly attachment point and a movable hose assembly attachment point, which meets the dimensional requirements of Figure 5 for the size of hose being tested. The attachment points connect to the end fittings on the hose assembly without leakage and, after the hose assembly has been installed for the flex test, are restrained from rotation. The movable end has a linear travel of 6 inches and a cycle rate of 100 cycles per minute. The machine is capable of increasing the air pressure in the hose assembly from zero to 150 psi within 2 seconds, and decreasing the air pressure in the hose assembly from 150 to zero psi within 2 seconds.
S8.7.2 Preparation. (a) Lay the hose material on a flat surface in an unstressed condition. Apply a permanent marking line along the centerline of the hose on the uppermost surface.

(b) Prepare the hose assembly with a free length as shown in the table accompanying Figure 5. The end fittings shall be attached according to the end fitting manufacturer’s instructions.

(c) Plug the ends of the hose assembly and conduct the salt spray test in S6.11 using an air brake hose assembly. Remove the plugs from the end fittings.

(d) Within 168 hours of completion of the salt spray test, expose the hose assembly to an air temperature of 212 degrees Fahrenheit (100 degrees Celsius) for 70 hours, with the hose in a straight position. Remove the hose and cool it at room temperature for 2 hours. Within 166 hours, subject the hose to the flexure test in S8.7.2(e).

(e) Install the hose assembly on the flex testing machine as follows. With the movable hose attachment point at the mid point of its travel, attach one end of the hose to the movable attachment point with the marked line on the hose in the uppermost position. Attach the other end of the hose to the fixed attachment point allowing the hose to follow its natural curvature.
(f) Cycle the air pressure in the hose by increasing the pressure in the hose from zero psi to 150 psi and holding constant for one minute, then decreasing the pressure from 150 psi to zero psi and holding constant for one minute. Continue the pressure cycling for the duration of the flex testing. Begin the flex testing by cycling the movable attachment point through 6 inches of travel at a rate of 100 cycles per minute. Stop the flex testing and pressure cycling after one million flex cycles have been completed.

(g) Install an orifice with a hole diameter of 0.0625 inches and a thickness of 0.032 inches in the air pressure supply line to the hose assembly. Provide a gauge or other means to measure air pressure in the hose assembly. Regulate the supply air pressure to the orifice to 150 psi.

(h) Apply 150 psi air pressure to the orifice. After 2 minutes have elapsed, measure the air pressure in the brake hose assembly, while pressurized air continues to be supplied through the orifice.

S8.8 Corrosion resistance and burst strength test. (a) Conduct the test specified in S6.11 using an air brake hose assembly. Remove the plugs from the ends of the hose assembly.

(b) Fill the hose assembly with water, allowing all gases to escape. Apply water pressure at a uniform rate of increase of approximately 1,000 psi per minute until the hose ruptures.

S8.9 Tensile strength test. Utilize a tension testing machine conforming to the requirements of American Society for Testing and Materials (ASTM) E4-03 "Standard Practices for Force Verification of Testing Machines," and provided with a recording device to measure the force applied.

(a) Attach an air brake hose assembly to the testing machine to permit straight, even, machine pull on the hose. Use adapters to mount hose assemblies equipped with angled end fittings so that the hose is in a straight position when installed on the machine.

(b) Apply tension at a rate of 1 inch per minute travel of the moving head until separation occurs.

S8.10 Water Absorption and tensile strength test. Immerse an air brake hose assembly in distilled water at room temperature for 70 hours. Thirty minutes after removal from the water, conduct the test specified in S8.9.

S8.11 Zinc chloride resistance test. Immerse an air brake hose in a 50 percent zinc chloride aqueous solution at room temperature for 200 hours. Remove it from the solution and examine it under 7-power magnification for cracks.

S8.12 End fitting corrosion resistance test. Conduct the test specified in S6.11 using an air brake hose assembly.

S8.13 Adhesion test for air brake hose reinforced by wire. (a) Place a steel ball with a diameter equal to 73 percent of the nominal inside diameter of the hose being tested inside of the hose. Plug one end of the hose. Attach the other end of the hose to a source of vacuum.

(b) Subject the hose to a vacuum of 26 inches of Hg for five minutes. With the vacuum still applied to the hose, bend the hose 180 degrees around a large test cylinder with a radius specified in Table IV for the size of hose tested. At the location of this bend, bend the hose 180 degrees around the test cylinder in the opposite direction.

(c) With the vacuum still applied to the hose, return the hose to a straight position. Attempt to roll the ball inside the hose using gravity from one end of the hose to the other end.

S8.14 Constriction test. Perform the constriction test in S6.12 using an air brake hose, except that the spherical diameter “A” of the plug gauge in Figure 4, or the diameter of the rigid spherical ball in S6.12.3(a), shall be 66 percent of the nominal inside diameter of the air brake hose being tested.

S9. Requirements—vacuum brake hose, brake hose assemblies, and brake hose end fittings.

S9.1 Labeling.

S9.1.1 Hose. Each vacuum brake hose shall be labeled, or cut from bulk hose that is labeled, at intervals of not more than 6 inches, measured from the end of one legend to the beginning of the next, in block capital letters and numerals at least one-eighth of an inch high, with the information listed in paragraphs (a) through (e) of this section. The information need not be present on hose that is sold as part of
§571.106  49 CFR Ch. V (10–1–08 Edition)

a brake hose assembly or a motor vehicle. (a) The symbol DOT, constituting a certification by the hose manufacturer that the hose conforms to all applicable motor vehicle safety standards.

(b) A designation that identifies the manufacturer of the hose, which shall be filed in writing with: Office of Crash Avoidance Standards, Vehicle Dynamics Division, National Highway Traffic Safety Administration, 400 Seventh Street, SW., Washington, DC 20590. The designation may consist of block capital letters, numerals or a symbol.

(c) The month, day, and year, or the month and year, of manufacture, expressed in numerals. For example, 10/1/96 means October 1, 1996.

(d) The nominal inside diameter of the hose expressed in inches or fractions of inches or in millimeters, or the nominal outside diameter of plastic tubing expressed in inches or fractions of inches or in millimeters followed by the letters OD. The abbreviation “mm” shall follow hose sizes that are expressed in millimeters. (Example of inside diameter: 5/32, 1/4, 4 mm. Example of outside diameter: 1/4 OD, 12 mm OD.)

(e) The letters “VL” or “VH” shall indicate that the component is a light-duty vacuum brake hose or heavy-duty vacuum brake hose, respectively.

S9.1.2 End fittings. Except for an end fitting that is attached by heat shrinking or by interference fit with plastic vacuum hose or that is attached by deformation of the fitting about a hose by crimping or swaging, at least one component of each vacuum brake hose fitting shall be etched, embossed, or stamped in block capital letters and numerals at least one-eighth of an inch high with the following information:

(a) The symbol DOT, constituting certification by the manufacturer of that component that the component conforms to all applicable motor vehicle safety standards.

(b) A designation that identifies the manufacturer of that component of the fitting, which shall be filed in writing with: Office of Crash Avoidance Standards, Vehicle Dynamics Division, National Highway Traffic Safety Administration, 400 Seventh Street, SW., Washington, DC 20590. The designation may consist of block capital letters, numerals or a symbol.

(c) The letters “VL” or “VH” shall indicate that the end fitting is intended for use in a light-duty or heavy-duty vacuum brake system, respectively.

(d) The nominal inside diameter of the hose to which the fitting is properly attached expressed in inches or fractions of inches or in millimeters, or the outside diameter of the plastic tubing to which the fitting is properly attached expressed in inches or fraction of inches or in millimeters followed by the letter OD (See examples in S9.1.1(d)). The abbreviation “mm” shall follow hose sizes that are expressed in millimeters.

S9.1.3 Assemblies. Each vacuum brake hose assembly made with end fittings that are attached by crimping or swaging and each plastic tube assembly made with end fittings that are attached by heat shrinking or dimensional interference fit, except those sold as part of a motor vehicle, shall be labeled by means of a band around the brake hose assembly as specified in this paragraph or, at the option of the manufacturer, by means of labeling as specified in S9.1.3.1. The band may at the manufacturer’s option be attached so as to move freely along the length of the assembly, as long as it is retained by the end fittings. The band shall be etched, embossed, or stamped in block capital letters, numerals or symbols at least one-eighth of an inch high, with the following information:

(a) The symbol DOT, constituting certification by the hose assembler that the hose assembly conforms to all applicable motor vehicle safety standards.

(b) A designation that identifies the manufacturer of the hose assembly, which shall be filed in writing with: Office of Crash Avoidance Standards, Vehicle Dynamics Division, National Highway Traffic Safety Administration, 400 Seventh Street, SW., Washington, DC 20590. The designation may consist of block capital letters, numerals or a symbol.

S9.1.3.1 At least one end fitting of a vacuum brake hose assembly made with end fittings that are attached by crimping or swaging, or of a plastic
tubing assembly made with end fittings that are attached by heat shrinking or dimensional interference fit shall be etched, stamped or embossed with a designation at least one-sixteenth of an inch high that identifies the manufacturer of the hose assembly and is filed in accordance with S9.1.3(b).

S9.2 Test requirements. Each vacuum brake hose assembly or appropriate part thereof shall be capable of meeting any of the requirements set forth under this heading, when tested under the conditions of S13 and the applicable procedures of S10. However, a particular hose assembly or appropriate part thereof need not meet further requirements after having met the constriction requirement (S9.2.1) and then having been subjected to any one of the requirements specified in S9.2.2 through S9.2.10.

S9.2.1 Constriction. Except for that part of an end fitting which does not contain hose, every inside diameter of any section of a vacuum brake hose assembly shall not be less than 75 percent of the nominal inside diameter of the hose if for heavy duty, or 70 percent of the nominal inside diameter of the hose if for light duty (S10.11).

S9.2.2 High temperature resistance. A vacuum brake hose tested under the conditions specified in S10.1 shall:

(a) Not show cracks visible under 7-power magnification after conditioning at minus 40 degrees Fahrenheit (minus 40 degrees Celsius) for 70 hours when bent around a cylinder having the radius specified in Table V for the size hose tested; and

(b) Not leak when subjected to a hydrostatic pressure test (S10.4).

S9.2.3 Low temperature resistance. A vacuum brake hose tested under the conditions specified in S10.2 shall:

(a) Not show cracks visible under 7-power magnification after conditioning at minus 40 degrees Fahrenheit (minus 40 degrees Celsius) for 70 hours when bent around a cylinder having the radius specified in Table V for the size hose tested; and

(b) Not leak when subjected to a hydrostatic pressure test (S10.4).

S9.2.4 Ozone resistance. A vacuum brake hose shall not show cracks visible under 7-power magnification after exposure to ozone for 70 hours (S10.3).

S9.2.5 Burst strength. A vacuum brake hose shall not rupture under hydrostatic pressure of 350 psi (S10.5).

S9.2.6 Vacuum. The collapse of the outside diameter of a vacuum brake hose under internal vacuum of 26 inches of Hg for five minutes shall not exceed one-sixteenth of an inch (S10.6).

S9.2.7 Bend. The collapse of the outside diameter of a vacuum brake hose, other than a preformed vacuum brake hose, at the middle point of the test length when bent until the ends touch shall not exceed the values given in Table V for the size of hose tested (S10.6).

*These sizes are listed to provide test values for brake hoses manufactured in these sizes. They do not represent conversions.
§ 571.106  49 CFR Ch. V (10–1–08 Edition)

S9.2.8 Swell and adhesion. Following exposure to Reference Fuel B, every inside diameter of any section of a vacuum brake hose shall not be less than 75 percent of the nominal inside diameter of the hose if for heavy duty, or 70 percent of the nominal inside diameter of the hose if for light duty. The vacuum brake hose shall show no leakage in a vacuum test of 26 inches of Hg for 10 minutes. A vacuum hose that is constructed of two or more layers shall withstand a force of 6 pounds per inch of length before separation of adjacent layers. (S10.7).

S9.2.9 Deformation. A vacuum brake hose shall return to 90 percent of its original outside diameter within 60 seconds after five applications of force as specified in S10.8, except that a wire-reinforced hose need only return to 85 percent of its original outside diameter. In the case of a heavy duty hose, the first application of force shall not exceed a peak value of 70 pounds, and the fifth application of force shall reach a peak value of at least 40 pounds. In the case of light duty hose the first application of force shall not exceed a peak value of 50 pounds, and the fifth application of force shall reach a peak value of at least 20 pounds (S10.9).

S9.2.10 End fitting corrosion resistance. After 24 hours of exposure to salt spray, vacuum brake hose end fittings shall show no base metal corrosion of the end fitting surface except where crimping or the application of labeling information has caused displacement of the protective coating. (S10.10).

S10. Test procedures—Vacuum brake hose, brake hose assemblies, and brake hose end fittings.

S10.1 High temperature resistance test. (a) Measure the initial outside diameter of the hose.

(b) Subject the hose to an internal vacuum of 26 inches of Hg at an ambient temperature of 257 degrees Fahrenheit (125 degrees Celsius) for a period of 96 hours. Remove the hose to room temperature and atmospheric pressure.

(c) Within 5 minutes of completion of the conditioning in S10.1(b), measure the outside diameter at the point of greatest collapse and calculate the percentage collapse based on the initial outside diameter.

(d) Cool the hose at room temperature for 5 hours. Bend the hose around a mandrel with a diameter equal to five times the initial outside diameter of the hose. Examine the exterior of the hose for cracks, charring, or disintegration visible without magnification. Remove the hose from the mandrel.

(e) Fill the hose assembly with water, allowing all gases to escape. Apply water pressure in the hose of 175 psi within 10 seconds. Maintain an internal hydrostatic pressure of 175 psi for one minute and examine the hose for visible leakage.

S10.2 Low temperature resistance test. (a) Conduct the test specified in S8.2(a) through (c) using vacuum brake hose with the cylinder radius specified in Table V for the size of hose tested.

(b) Remove the hose from the test cylinder, warm the hose at room temperature for 5 hours, and conduct the hydrostatic pressure test in S10.1(e).

S10.3 Ozone resistance test. Conduct the test specified in S6.8 using vacuum brake hose.

S10.4 Burst strength test. Conduct the test specified in S8.8 using vacuum brake hose.

S10.5 Vacuum test. Utilize a 12-inch vacuum brake hose assembly sealed at one end. (a) Measure the hose outside diameter.

(b) Attach the hose to a source of vacuum and subject it to a vacuum of 26 inches of Hg for 5 minutes.

(c) Measure the hose to determine the minimum outside diameter while the hose is still subject to vacuum.

S10.6 Bend test. (a) Bend a vacuum brake hose, of the length prescribed in Table V, in the direction of its normal curvature until the ends just touch as shown in Figure 6.

(b) Measure the outside diameter of the specimen at point A before and after bending.

(c) The difference between the two measurements is the collapse of the hose outside diameter on bending.
FIG. 6—BEND TEST OF VACUUM BRAKE HOSE.

S10.7 Swell and adhesion test. (a) Fill a specimen of vacuum brake hose 12 inches long with ASTM Reference Fuel B as described in ASTM D471–98 Standard Test Method for Rubber Property—Effect of Liquids. This incorporation by reference was approved by the Director of the Federal Register in accordance with 5 U.S.C. 552(a) and 1 CFR part 51. Copies may be obtained from the American Society for Testing and Materials (ASTM) International, 100 Barr Harbor Drive, P.O. Box C700, West Conshohocken, PA 19428-2959. Copies may be inspected at the National Highway Traffic Safety Administration, Technical Information Services, 400 Seventh St., SW., Plaza Level, Room 403, Washington, DC 20590, or at the National Archives and Records Administration (NARA). For information on the availability of this material at NARA, call 202-741-6030, or go to: http://www.archives.gov/federal_register/code_of_federal_regulations/ibr_locations.html.

(b) Maintain reference fuel in the hose under atmospheric pressure at room temperature for 48 hours.

(c) Remove fuel and conduct the constriction test in S10.11.

(d) Attach the hose to a source of vacuum and subject it to a vacuum of 26 inches of Hg for 10 minutes. Remove the hose from the vacuum source.

(e) For a vacuum brake hose constructed of two or more layers, conduct the test specified in S8.6 using the vacuum brake hose.

S10.8 [Reserved]

S10.9 Deformation test. Table VI specifies the test specimen dimensions.

S10.9.1 Apparatus. Utilize a compression device, equipped to measure force of at least 100 pounds, and feeler gages of sufficient length to be passed completely through the test specimen.

S10.9.2 Operation. (a) Position the test specimen longitudinally in the compression device with the fabric laps not in the line of the applied pressure.

*These sizes are listed to provide test values for brake hoses manufactured in these sizes. They do not represent conversions.

(b) Apply gradually increasing force to the test specimen to compress its inside diameter to that specified in Table VI (dimension D of Figure 7) for the size of hose tested.

(c) After 5 seconds release the force and record the peak load applied.

(d) Repeat the procedure four times permitting a 10-second recovery period between load applications.

S10.10 End fitting corrosion resistance test. Conduct the test specified in S6.11 using a vacuum brake hose assembly.

S10.11 Constriction test. Perform the constriction test in S6.12 using a vacuum brake hose, except that the spherical diameter “A” of the plug gauge in Figure 4, or the diameter of the rigid

FIG. 7—DEFORMED SPECIMEN OF VACUUM BRAKE HOSE

Load
§ 571.106  49 CFR Ch. V (10–1–08 Edition)

spherical ball in S6.12.3(a), shall be 75 percent of the nominal inside diameter of the vacuum brake hose if it is heavy duty, or 70 percent of the nominal inside diameter of the vacuum brake hose if it is light duty.

S11. Requirements—Plastic air brake tubing, plastic air brake tubing assemblies, and plastic air brake tubing end fittings.

11.1 Construction. Each plastic air brake tubing assembly shall be equipped with permanently attached end fittings or reusable end fittings. Plastic air brake tubing shall conform to the dimensional requirements specified in Table VII. (S12.1)

S11.2 Labeling.

11.2.1 Plastic air brake tubing. Plastic air brake tubing shall be labeled, or cut from bulk tubing that is labeled, at intervals of not more than 6 inches, measured from the end of one legend to the beginning of the next, in block capital letters and numerals at least one-eighth of an inch high, with the information listed in paragraphs (a) through (e) of this section. The information need not be present on tubing that is sold as part of a motor vehicle.

(a) The symbol DOT, constituting a certification by the hose manufacturer that the hose conforms to all applicable motor vehicle safety standards.

(b) A designation that identifies the manufacturer of the tubing, which shall be filed in writing with: Office of Vehicle Safety Compliance, Equipment Division NVS–222, National Highway Traffic Safety Administration, 400 Seventh St. SW., Washington, DC 20590. The designation may consist of block capital letters, numerals, or a symbol.

(c) The month, day, and year, or the month and year, of manufacture, expressed in numerals. For example, 10/1/96 means October 1, 1996.

(d) The nominal outside diameter expressed in inches or fractions of inches or in millimeters followed by the letters OD. The abbreviation “mm” shall follow tubing sizes that are expressed in millimeters. (Examples: ¼ OD, 6 mm OD.)

(e) The letter “A” shall indicate intended use in air brake systems.

11.2.2 End fittings. Except for an end fitting that is attached by deformation of the fitting about the tubing by crimping or swaging, at least one component of each plastic air brake tubing end fitting shall be etched, embossed, or stamped in block capital letters and numerals at least one-sixteenth of an inch high with the following information:

(a) The symbol DOT, constituting a certification by the manufacturer that the end fitting conforms to all applicable motor vehicle safety standards.

(b) A designation that identifies the manufacturer of the end fitting, which shall be filed in writing with: Office of Vehicle Safety Compliance, Equipment Division NVS–222, National Highway Traffic Safety Administration, 400 Seventh St. SW., Washington, DC 20590.
The designation may consist of block capital letters, numerals, or a symbol.

c) The letter ‘‘A’’ shall indicate intended use in air brake systems.

d) The nominal outside diameter of the plastic tubing to which the fitting is properly attached expressed in inches or fractions of inches or in millimeters followed by the letters OD. The abbreviation ‘‘mm’’ shall follow tubing sizes that are expressed in millimeters. (Examples: 3/8 OD, 6 mm OD)

S11.2.3. Assemblies. Each plastic air brake tubing assembly made with end fittings that are attached by crimping or swaging, except those sold as part of a motor vehicle, shall be labeled by means of a band around the brake tubing assembly as specified in this paragraph or, at the option of the manufacturer, by means of labeling as specified in S11.2.3.1. The band may at the manufacturer’s option be attached so as to move freely along the length of the assembly, as long as it is retained by the end fittings. The band shall be etched, embossed, or stamped in block capital letters, numerals or symbols at least one-eighth of an inch high, with the following information:

(a) The symbol DOT, constituting certification by the tubing assembler that the tubing assembly conforms to all applicable motor vehicle safety standards.

(b) A designation that identifies the manufacturer of the hose assembly, which shall be filed in writing with: Office of Vehicle Safety Compliance, Equipment Division NVS–222, National Highway Traffic Safety Administration, 400 Seventh St. SW., Washington, DC 20590. The designation may consist of block capital letters, numerals, or a symbol.

S11.2.3.1 At least one end fitting of a plastic air brake tubing assembly made with end fittings that are attached by crimping or swaging shall be etched, stamped, or embossed with a designation at least one-sixteenth of an inch high that identifies the manufacturer of the tubing assembly and is filed in accordance with S11.2.3(b).

S11.3 Test requirements. Each plastic air brake tubing assembly or appropriate part thereof shall be capable of meeting any of the requirements set forth under this heading, when tested under the conditions of S13 and the applicable procedures of S12. However, a particular tubing assembly or appropriate part thereof need not meet further requirements after having met the constriction requirement (S11.3.1) and then having been subjected to any one of the requirements specified in S11.3.2 through S11.3.24. Unless otherwise specified, testing is conducted on a sample of tubing 12 inches in length.

S11.3.1 Constriction. Every inside diameter of any section of a plastic air brake tubing assembly shall not be less than 66 percent of the nominal inside diameter of the brake tubing. (S12.2)

S11.3.2 High temperature conditioning and dimensional stability. Plastic air brake tubing shall conform to the dimensions in Table VII after conditioning in air at 230 degrees Fahrenheit (110 degrees Celsius) for four hours. (S12.3)

S11.3.3 Boiling water conditioning and dimensional stability. Plastic air brake tubing shall conform to the dimensions in Table VII after conditioning in boiling water for two hours. (S12.4)

S11.3.4 Burst Strength. Plastic air brake tubing shall not rupture when subjected to the burst strength pressure in Table VIII for the size of tubing being tested. (S12.5)

S11.3.5 Moisture absorption and burst strength. Plastic air brake tubing shall not rupture when subjected to 80 percent of the burst strength pressure in Table VIII, after the tubing has been dried in an oven and then conditioned in a 100 percent relative humidity atmosphere at 75 degrees Fahrenheit (24 degrees Celsius) for 100 hours. (S12.6)

NOTES: (1) Supported bend radius for tests specifying cylinders around which the tubing is bent. (2) Unsupported bend radius for the collapse resistance test in which the tubing is not supported by a cylinder during bending.

S11.3.6 Ultraviolet light resistance. Plastic air brake tubing shall not rupture when subjected to 80 percent of the burst strength pressure in Table VIII for the size of tubing being tested, after being exposed to ultraviolet light for 300 hours and then impacted with a one pound weight dropped from a height of 12 inches. (S12.7)

S11.3.7 Low temperature flexibility. The outer surface of plastic air brake tubing shall not show cracks visible without magnification as a result of conditioning in air at 230 degrees Fahrenheit (110 degrees Celsius) for 24 hours, and then conditioning in air at minus 40 degrees Fahrenheit (minus 40 degrees Celsius) for four hours, and then bending the tubing 180 degrees around a test cylinder having a radius equal to six times the nominal outside diameter of the tubing. (S12.8)

S11.3.8 High temperature flexibility. Plastic air brake tubing shall not rupture or burst when subjected to 80 percent of the burst strength pressure in Table VIII for the size of tubing being tested, after the tubing has been:

(a) Conditioned in air at 230 degrees Fahrenheit (110 degrees Celsius) for 72 hours while bent 180 degrees around a cylinder having a radius equal to the supported bend radius in Table VIII for the size of tubing being tested; and

(b) Cooled to room temperature while remaining on the cylinder, then straightened; and

(c) Bent 180 degrees around the cylinder in the opposite direction of the first bending. (S12.9)

S11.3.9 High temperature resistance. Plastic air brake tubing shall not rupture or burst when subjected to 80 percent of the burst strength pressure in Table VIII for the size of tubing being tested, after the tubing has been conditioned in air at 230 degrees Fahrenheit (110 degrees Celsius) for 72 hours. (S12.10)

S11.3.10 High temperature conditioning, low temperature impact resistance. Plastic air brake tubing shall not rupture or burst when subjected to 80 percent of the burst strength pressure in Table VIII for the size of tubing being tested, after the tubing has been conditioned in air at 230 degrees Fahrenheit (110 degrees Celsius) for 24 hours, then conditioned in air at minus 40 degrees Fahrenheit (minus 40 degrees Celsius) for 4 hours, and then impacted with a one pound weight dropped from a height of 12 inches. (S12.11)

S11.3.11 Boiling water conditioning, low temperature impact resistance. Plastic air brake tubing shall not rupture when subjected to 80 percent of the burst strength pressure in Table VIII for the size of tubing being tested, after the tubing has been conditioned in boiling water for two hours, then conditioned in air at minus 40 degrees Fahrenheit (minus 40 degrees Celsius) for 4 hours, and then impacted with a one pound weight dropped from a height of 12 inches. (S12.12)

S11.3.12 Zinc chloride resistance. The outer surface of plastic air brake tubing shall not show cracks visible under 7-power magnification after immersion in a 50 percent zinc chloride aqueous...
solution for 200 hours while bent around a cylinder having a radius equal to the supported bend radius in Table VIII for the size of tubing tested. (S12.13)

S11.3.13 Methyl alcohol resistance. The outer surface of plastic air brake tubing shall not show cracks visible under 7-power magnification after immersion in a 95 percent methyl alcohol aqueous solution for 200 hours while bent around a cylinder having a radius equal to the supported bend radius in Table VIII for the size of tubing tested. (S12.13)

S11.3.14 High temperature conditioning and collapse resistance. The collapse of the outside diameter of plastic air brake tubing shall not exceed twenty percent of the original outside diameter when bent 180 degrees on a holding fixture to the unsupported bend radius specified in Table VIII and conditioned in air at 200 degrees Fahrenheit (93 degrees Celsius) for 24 hours. (S12.14)

S11.3.15 Ozone resistance. The outer surface of plastic air brake tubing shall not show cracks visible under 7-power magnification after exposure to ozone for 70 hours at 104 degrees Fahrenheit (40 degrees Celsius). (S12.15)

S11.3.16 Oil resistance. Plastic air brake tubing shall not rupture when subjected to 80 percent of the burst strength pressure in Table VIII for the size of tubing being tested, after the tubing has been conditioned in ASTM IRM 903 oil at 212 degrees Fahrenheit (100 degrees Celsius) for 70 hours. (S12.16)

S11.3.17 Tensile strength. A plastic air brake tubing assembly designed for use between frame and axle or between a towed and a towing vehicle shall withstand, without separation of the tubing from its end fittings, a pull of 250 pounds if it is ⅜ inch, 10 mm, or less in nominal outside diameter, or a pull of 325 pounds if it is larger than ⅜ inch or 10 mm in nominal outside diameter. A plastic air brake tubing assembly designed for use in any other application shall withstand, without separation of the hose from its end fittings, a pull of 50 pounds if it is ⅜ to ⅞ inch or 5 mm to 10 mm in nominal outside diameter, 150 pounds if it is ¼ to ⅜ inch or 11 mm to 16 mm in nominal outside diameter, or 325 pounds if it is larger than ⅜ inch or 16 mm in nominal outside diameter. (S12.17)

S11.3.18 Boiling water conditioning and tensile strength. A plastic air brake tubing assembly when subjected to a tensile pull test shall either elongate 50 percent or withstand the conditioned tensile load in Table VIII without separation from its end fittings, with one end of the assembly conditioned in boiling water for 5 minutes. (S12.18)

S11.3.19 Thermal conditioning and tensile strength. A plastic air brake tubing assembly when subjected to a tensile pull test shall either elongate 50 percent or withstand the conditioned tensile load in Table VIII without separation from its end fittings after the assembly has been subjected to four cycles of conditioning in air at minus 40 degrees Fahrenheit (minus 40 degrees Celsius) for thirty minutes, normalizing at room temperature, conditioning in boiling water for 15 minutes, and normalizing at room temperature. (S12.19)

S11.3.20 Vibration resistance. A plastic air brake tubing assembly with an internal air pressure of 120 psig shall not rupture or leak more than 50 cm³ per minute at a temperature of minus 40 degrees Fahrenheit (minus 40 degrees Celsius) and 25 cm³ per minute at a temperature of 75 degrees Fahrenheit (24 degrees Celsius), after the assembly has been subjected to 1,000,000 cycles of vibration testing with one end of the assembly fixed and the other end stroked ½-inch at 600 cycles per minute. In addition, end fittings that use a threaded retention nut shall retain at least 20 percent of the original retention nut tightening torque upon completion of the vibration testing. The vibration test shall be conducted in an environmental chamber and the air temperature shall be cycled between minus 40 degrees Fahrenheit (minus 40 degrees Celsius) and 220 degrees Fahrenheit (104 degrees Celsius) during the test. (S12.20)
§ 571.106

S11.3.21  End fitting retention. The end fittings of a plastic air brake tubing assembly shall not rupture when the assembly is filled with water and pressurized to the burst strength pressure in Table VIII. (S12.22)

S11.3.22  Thermal conditioning and end fitting retention. The end fittings of a plastic air brake tubing assembly shall not rupture when the tubing assembly is filled with ASTM IRM 903 oil and:

(a) Conditioning in air at 200 degrees Fahrenheit (93 degrees Celsius) for 24 hours with atmospheric pressure inside the tubing assembly; and

(b) Increasing the pressure inside the tubing assembly to 450 psi, and holding this pressure for five minutes while maintaining an air temperature of 200 degrees Fahrenheit (93 degrees Celsius); and

(c) Reducing the pressure inside the tubing assembly to atmospheric and permitting the tubing assembly to cool at 75 degrees Fahrenheit (24 degrees Celsius) for 1 hour; and

(d) Conditioning the tubing assembly in air at minus 40 degrees Fahrenheit (minus 40 degrees Celsius) for 24 hours with atmospheric pressure inside the tubing assembly; and

(e) Increasing the pressure inside the tubing assembly to 450 psi, and holding this pressure for five minutes while maintaining an air temperature of minus 40 degrees Fahrenheit (minus 40 degrees Celsius). (S12.23)

S11.3.23  End fitting serviceability. A plastic air brake end fitting that uses a threaded retention nut shall not rupture or leak more than 25 cm³ per minute when pressurized to 120 psi after five assembly cycles. (S12.24)

S11.3.24  End fitting corrosion resistance. After 24 hours of exposure to salt spray, air brake hose end fittings shall show no base metal corrosion on the end fitting surface except where crimping or the application of labeling information causes a displacement of the protective coating. (S12.25)

S12.  Test procedures—Plastic air brake tubing, plastic air brake tubing assemblies, plastic air brake tubing end fittings.

S12.1  Air brake tubing dimensions. Measure the tubing dimensions including wall thickness, inside diameter, and outside diameter, using appropriate metrology apparatus such as micrometers, dial indicators and gauges, or optical comparators. To account for slight out-of-round conditions, diameter measurements may be calculated using the average of the major and minor diameters.

S12.2  Constriction test. Perform the constriction test in S6.12 using an air brake tubing assembly, except that the spherical diameter “A” of the plug gauge in Figure 4, or the diameter of the rigid spherical ball in S6.12.3(a), shall be 66 percent of the nominal inside diameter of the tubing as specified in Table VII.

S12.3  High temperature conditioning and dimensional stability test. (a) Condition the tubing at 230 degrees Fahrenheit (110 degrees Celsius) for 4 hours in an air oven.

(b) Remove the tubing from the oven and allow to cool at room temperature for 30 minutes.

(c) Measure the dimensions of the tubing using the procedure in S12.1.

S12.4  Boiling water conditioning and dimensional stability test. (a) Utilize a container constructed of a non-reactive material large enough so that the tubing to be tested does not touch any surface of the container. Fill container with distilled water.

(b) Slip the tubing over a stainless steel wire for positioning it in the pot.

(c) Bring the water to a boil. Place the tubing in the water and position it so that it does not touch the container. Boil the tubing for two hours. Replenish the water as necessary, adding it slowly so that the water in the pot boils continuously.

(d) Remove the tubing from the water and allow to cool at room temperature for 30 minutes. Wipe off any water that remains on the tubing.

(e) Measure the dimensions of the tubing using the procedure in S12.1.

S12.5  Burst strength test. (a) Utilize an air brake tubing assembly or prepare a 12 inch length of tubing and install end fittings according to the end fitting manufacturer’s instructions.

(b) Plug one end of the assembly, fill it with water, and connect the other end to a source of water pressure. Bleed any air from the assembly and water pressure system.

(c) Increase the water pressure inside the tubing assembly at a rate of 3,000
psi per minute to the burst strength pressure for the size of tubing being tested as specified in Table VIII.

S12.6 Moisture absorption and burst strength. (a) Prepare a sample of tubing twelve inches in length.

(b) Condition the tubing at 230 degrees Fahrenheit (110 degrees Celsius) for 24 hours in an air oven. Remove the tubing from the oven and within 30 seconds, and weigh it to establish the initial weight. The weight shall be measured with a resolution of 0.01 gram; if the scale has a higher resolution, then values of 0.005 gram and above shall be rounded to the nearest 0.01 gram and values below 0.005 gram shall be truncated.

(c) Place the tubing in an environmental chamber and condition it for 100 hours at 100 percent relative humidity and a temperature of 75 degrees Fahrenheit (24 degrees Celsius).

(d) Remove the tubing from the chamber and within a period of 5 minutes, remove all surface moisture from the tubing using cloth and weigh the tubing to establish the conditioned weight. Weight shall be measured to the nearest 0.01 gram as in S12.6(b).

(e) Calculate percentage of moisture absorption as follows:

\[
\frac{\text{Conditioned Weight} - \text{Initial Weight}}{\text{Initial Weight}} \times 100
\]

(f) Install end fittings according to the end fitting manufacturers instructions.

(g) Conduct the burst strength test in S12.5 except use 80 percent of the burst strength pressure for the size of tubing being tested as specified in Table VIII.

S12.7 Ultraviolet light resistance test.

(a) Apparatus. An accelerated weathering test machine for ultraviolet light conditioning of plastic air brake tubing. The machine shall be equipped with fluorescent UVA-340 light bulbs and automatic irradiance control. Also utilize an impact test apparatus as shown in Figure 8.

(b) Test standards. The testing is in accordance with American Society for Testing and Materials (ASTM) G154-00 “Standard Practice for Operating Fluorescent Light Apparatus for UV Exposure of Nonmetallic Materials;” ASTM G151-97 “Standard Practice for Exposing Nonmetallic Materials in Accelerated Test Devices that Use Laboratory Light Sources;” and ASTM D4329-99 “Standard Practice for Fluorescent UV Exposure of Plastics.” These incorporations by reference were approved by the Director of the Federal Register in accordance with 5 U.S.C. 552(a) and 1 CFR part 51. Copies may be obtained from the American Society for Testing and Materials (ASTM) International, 100 Barr Harbor Drive, P.O. Box C700, West Conshohocken, PA 19428-2959. Copies may be inspected at the National Highway Traffic Safety Administration, Technical Information Services, 400 Seventh St., SW., Plaza Level, Room 403, Washington, DC 20590, or at the National Archives and Records Administration (NARA). For information on the availability of this material at NARA, call (202) 741-6030, or go to: http://www.archives.gov/federal_register/code_of_federal_regulations/ibr_locations.html.

(c) Preparation. (1) Utilize a 12 inch length of plastic air brake tubing. Mask 1 inch of each end of the tubing where end fittings will be attached using opaque tape.

(2) Attach the tubing to the test rack of the machine, securing it at the ends along the masked sections. Wipe the outside surface of the tubing with acetone to remove any surface contaminants. Place the tubing and rack in the accelerated weathering test machine so that the center of the tubing assembly is approximately in the center of the UV light exposure area of the test machine. If multiple plastic brake tubing assemblies are tested, then their position in the machine should be rotated according to ASTM D4329-99 S7.4.1, except the rotation shall be each 96 hours instead of weekly. The distance from the light bulb to the tubing shall be approximately 2 inches. Set the UV irradiance to 0.85 watts per square meter at 340 nm and maintain this level during the testing. Maintain a temperature inside the test chamber of 113 degrees Fahrenheit (45 degrees Celsius), and use only atmospheric humidity. Expose the tubing at this UV irradiance level for 300 hours continuously. Remove the tubing from the test chamber.

(3) Place the tubing inside the impact test apparatus, and drop the impacter
onto the tubing from a height of 12 inches.
(4) Remove the masking material from the ends of the tubing. Install end fittings according to the end fitting manufacturer’s instructions. Conduct the burst strength test in §12.5 except use 80 percent of the burst strength pressure for the size of tubing being tested as specified in Table VIII.

FIGURE 8. IMPACT TEST APPARATUS
The text is a page from a document related to the testing of materials, specifically tubing. It describes various test procedures for high and low temperature flexibility, conditioning, and resistance tests. The text is technical and includes experimental procedures and conditions for testing the tubing. The table accompanying the figure 8 is also provided, which lists the nominal tubing outside diameter and the corresponding hole diameter in millimeters (mm) and inches. The text is structured in paragraphs detailing each test procedure, including the conditions for each test and the expected outcomes.
§ 571.106  49 CFR Ch. V (10–1–08 Edition)

the tubing inside the apparatus and drop the impactor onto the tubing from a height of 12 inches. Remove the tubing from the chamber and allow to warm at room temperature for one hour.

(e) Conduct the burst strength test in S12.5 except use 80 percent of the burst strength pressure for the size of tubing being tested as specified in Table VIII.

S12.13 Zinc chloride resistance test. (a) Utilize a cylinder having a radius equal to the supported bend radius in Table VIII for the size of tubing being tested. The cylinder is constructed of a non-reactive material or coated to prevent chemical reaction with zinc chloride. The length of the tubing sample is long enough so that its ends will not be submerged during the immersion in zinc chloride, or the ends of the tubing are plugged to keep the zinc chloride from entering the tubing.

(b) Bend the tubing 180 degrees around the cylinder and hold in place with a clamp or other suitable support constructed of non-reactive materials, applying only enough force on the tubing to hold it in position.

(c) Immerse the tubing and cylinder in a 50 percent zinc chloride aqueous solution at room temperature for 200 hours.

(d) Remove the tubing and cylinder from the solution. While still on the test cylinder, inspect the tubing under 7-power magnification for cracks.

S12.15 High temperature conditioning and collapse resistance test. (a) Apparatus. A holding device consisting of two vertical pins affixed to a flat, horizontal plate. Each pin projects 1 inch above the top surface of the plate. The diameter of each pin is approximately equal to the inside diameter of the tubing being tested. Using the unsupported bend radius for the size of tubing being tested from Table VIII, the distance between the pin centerlines is equal to:

\[2 \times \text{unsupported bend radius} + \text{nominal OD of tubing}\]

(b) Preparation. (1) Use the unsupported bend radius for the size of tubing being tested from Table VIII and cut the tubing to the following length:

\[3.14 \times [\text{unsupported bend radius}] + 10 \times [\text{nominal tubing OD}] + 2 \text{ inches}\]

or

\[3.14 \times [\text{unsupported bend radius}] + 10 \times [\text{nominal tubing OD}] + 50 \text{ mm}\]

(2) Place a reference mark at the center of the sample. At this mark, measure the initial outside diameter of the tubing. If the tubing is slightly out-of-round, use the elliptical minor diameter as the initial outside diameter.

(3) Install the tubing completely over the pins of the holding device so that the tubing is bent 180 degrees. If the tubing has a natural curvature, the tubing shall be bent in the direction of the natural curvature.

(4) Condition the holding device and tubing in an air oven at 200 degrees Fahrenheit (93 degrees Celsius) for 24 hours. Remove the holding device and tubing and allow to cool at room temperature for thirty minutes.

(5) With the tubing still mounted to the holding device, measure the elliptical minor diameter of the tubing at the reference mark to determine the final outside diameter.

(c) Calculation. Calculate the percentage collapse of the outside diameter of the tubing as follows:

\[\left(\frac{\text{Initial Outside Diameter} - \text{Final Outside Diameter}}{\text{Initial Outside Diameter}}\right) \times 100\]

S12.16 Ozone resistance test. Conduct the test specified in S6.8 using plastic air brake tubing.
S12.17 Oil resistance test. (a) Utilize a plastic air brake tubing assembly or prepare a 12 inch length of tubing and install end fittings according to the end fitting manufacturer’s instructions.

(b) Immerse the tubing in ASTM IRM 903 oil at 212 degrees Fahrenheit (100 degrees Celsius) for 70 hours. Remove and allow to cool at room temperature for 30 minutes. Wipe any excess oil from the tubing assembly.

(c) Conduct the burst strength test in S12.5 except use 80 percent of the burst strength pressure for the size of tubing being tested as specified in Table VIII and, at the manufacturer’s option, oil may be used as the test medium instead of water.

S12.18 Tensile strength test. Conduct the test in S8.9 using a plastic air brake tubing assembly or an assembly prepared from a 12 inch length of air brake tubing with end fittings installed according to the end fitting manufacturer’s instructions.

S12.19 Boiling water conditioning and tensile strength. (a) Apparatus. Use a tension testing machine as specified in S8.9. The lower attachment point of the machine is equipped with a heated, open-top container that is water tight. The inside of the container (lower attachment point) and upper attachment point of the machine have provisions to quickly attach a brake hose assembly for tensile testing.

(b) Preparation. Prepare an air brake tubing assembly with a free length of 6 inches (six inches of exposed tubing between the end fittings), with the end fittings installed in accordance with the end fitting manufacturer’s instructions. If necessary install adapters on the end fittings to permit quick attachment to the machine, to keep water from entering the tubing assembly, and/or to ensure that the tubing assembly is in a straight position when installed on the machine. Subject the tubing assembly to four complete cycles of the following sequence:

1. Condition the tubing assembly in an environmental chamber at minus 40 degrees Fahrenheit (minus 40 degrees Celsius) for 30 minutes. Remove from the chamber and allow to warm at room temperature for 30 minutes.

2. Condition the tubing assembly by submerging it in boiling water for 15 minutes. Remove and allow to cool at room temperature for 30 minutes. Install the tubing assembly on the tension testing machine and apply tension to the tubing assembly at a rate of one inch per minute travel of the moving head until either the conditioned tensile load in Table VIII for the size of tubing being tested is reached or the free length of the tubing assembly reaches 9 inches, whichever occurs first.

S12.20 Thermal conditioning and tensile strength. (a) Apparatus. Use a tension testing machine as specified in S8.9.

(b) Preparation. Prepare an air brake tubing assembly with a free length of 6 inches (six inches of exposed tubing between the end fittings), with the end fittings installed according to the manufacturer’s instructions. If necessary install adapters on the end fittings to permit attachment to the machine, to keep water from entering the tubing assembly, and/or to ensure that the tubing assembly is in a straight position when installed on the machine. Subject the tubing assembly to four complete cycles of the following sequence:

1. Condition the tubing assembly in an environmental chamber at minus 40 degrees Fahrenheit (minus 40 degrees Celsius) for 30 minutes. Remove from the chamber and allow to warm at room temperature for 30 minutes.

2. Condition the tubing assembly by submerging it in boiling water for 15 minutes. Remove and allow to cool at room temperature for 30 minutes. Install the tubing assembly on the tension testing machine and apply tension to the tubing assembly at a rate of one inch per minute travel of the moving head until either the conditioned tensile load in Table VIII for the size of tubing being tested is reached or the free length of the tubing assembly reaches 9 inches, whichever occurs first.

S12.21 Vibration resistance test. (a) Apparatus. A vibration testing machine that supports a brake tubing assembly by its end fittings in approximately a straight line and includes the following features:

1. One tubing assembly attachment point is fixed and the other moves in a plane perpendicular to a line projected between the attachment points. The movable attachment point moves in a
linear direction and travels \(\frac{1}{2}\) inch total and at its midpoint of travel falls on a line projected between the attachment points. The movable attachment point has a cycle rate of 600 cycles per minute.

(2) The distance between the attachment points is adjustable to compensate for varying lengths of brake tubing assemblies.

(3) The actuating mechanism for the movable attachment point is balanced to prevent introduction of machine vibration into the brake tubing assembly.

(4) The machine has a compressed air supply system that pressurizes the air brake tubing assembly through one fitting while the other fitting is plugged. The machine’s compressed air supply system includes a pressure gauge or monitoring system and an air flow meter.

(5) The machine is constructed so that an air brake tubing assembly mounted on it can be conditioned in an environmental test chamber.

(b) Preparation. (1) Prepare an air brake tubing assembly with a free length of 18 inches (18 inches of exposed tubing between the end fittings), with the end fittings installed in accordance with the end fitting manufacturer’s instructions. Record the initial tightening torque for an end fitting that uses a threaded retaining nut.

(2) Install the air brake tubing assembly on the vibration testing machine and, with the movable attachment point at the midpoint of its travel, adjust the distance between the attachment points so that they are \(\frac{1}{2}\) inch closer together than the distance at which the tubing assembly is taut.

(3) With the tubing assembly inside the environmental chamber, apply compressed air to the tubing assembly at a regulated pressure of 120 psi and maintain the supply of air to the tubing assembly for the duration of the test. Set the temperature of the environmental chamber to 220 degrees Fahrenheit (104 degrees Celsius) and initiate cycling of the movable attachment point. After 250,000 cycles, set the temperature of the environmental chamber to 220 degrees Fahrenheit (104 degrees Celsius). After 750,000 cycles, set the temperature of the environmental chamber to minus 40 degrees Fahrenheit (minus 40 degrees Celsius). Measure the air flow rate just prior to 1,000,000 cycles and if the compressed air flow rate supplied to the air brake tubing assembly exceeds 50 cubic centimeters per minute this constitutes failure of the test. Stop the cycling at 1,000,000 cycles and set the environmental chamber temperature to 75 degrees Fahrenheit (24 degrees Celsius), while air pressure is still supplied to the air brake tubing assembly. After one hour, measure the compressed air flow rate supplied to the air brake tubing assembly and if the rate exceeds 25 cubic centimeters per minute this constitutes failure of the test.

(4) For end fittings that use a threaded retaining nut, apply 20 percent of the original tightening torque as recorded in S12.21(b)(1). If the retention nut visibly moves, this constitutes a failure of the test.

S12.22 End fitting retention test. (a) Utilize an air brake tubing assembly or prepare a 12 inch length of tubing and install end fittings according to the end fitting manufacturer’s instructions.

(b) Plug one end of the assembly, fill it with water, and connect the other end to a source of water pressure. Bleed any air from the assembly and water pressure system.

(c) Increase the pressure inside the tubing assembly at a rate of 3,000 psi per minute to 50 percent of the burst strength pressure for the size of tubing being tested as specified in Table VIII. Hold the pressure constant for 30 seconds.

(d) Increase the pressure inside the tubing assembly at a rate of 3,000 psi per minute to the burst strength pressure for the size of tubing being tested as specified in Table VIII.

S12.23 Thermal conditioning and end fitting retention test. (a) Apparatus. A source of hydraulic pressure that includes a pressure gauge or monitoring system, uses ASTM IRM 903 oil, and is constructed so that an air brake tubing
assembly mounted to it can be conditioned in an environmental test chamber.

(b) Preparation. Utilize an air brake tubing assembly or prepare a 12 inch length of tubing and install end fittings according to the end fitting manufacturer’s instructions. Attach one end of the assembly to the hydraulic pressure supply and plug the other end of the assembly, fill the assembly with ASTM IRM 903 oil and bleed any air from the assembly, and place the tubing assembly inside an environmental chamber. Conduct the following tests:

(1) With atmospheric pressure applied to the oil inside the tubing assembly, set the environmental chamber temperature to 200 degrees Fahrenheit (93 degrees Celsius) and condition the tubing assembly for 24 hours.

(2) With the temperature maintained at 200 degrees Fahrenheit (93 degrees Celsius), increase the oil pressure inside the tubing assembly at a rate of 3,000 psi per minute to 450 psi, and hold this pressure for 5 minutes.

(3) Decrease the oil pressure inside the tubing assembly at a rate of 3,000 psi per minute to atmospheric pressure and set the temperature of the environmental chamber to 75 degrees Fahrenheit (24 degrees Celsius). Condition the tubing assembly at this temperature for 1 hour.

(4) Set the temperature of the environmental chamber to minus 40 degrees Fahrenheit (minus 40 degrees Celsius) and condition the tubing assembly for 24 hours.

(5) With the temperature maintained at minus 40 degrees Fahrenheit (minus 40 degrees Celsius), increase the hydraulic pressure inside the tubing assembly at a rate of 3,000 psi per minute to 450 psi, and hold this pressure for 5 minutes.

S12.24 End fitting serviceability. (a) Apparatus. A source of air pressure that includes a pressure gauge or monitoring system and is equipped with a mass air flow meter.

(b) Preparation. Prepare a 12-inch length of tubing and plug one end. Assemble the end fitting with the threaded retention nut on the other end of the tubing according to the end fitting manufacturer’s instructions, then disassemble the fitting. Repeat the assembly and disassembly sequence three more times, and then reassemble the end fitting (five total assembly steps).

(c) Attach the end fitting with the threaded retention nut to the source of air pressure. Pressurize the tubing at a rate of 3,000 psi per minute to a pressure of 120 psi. If the end fitting leaks, measure and record the leakage rate using the mass air flow meter.

S12.25 End fitting corrosion resistance. Utilize an air brake tubing assembly or prepare a 12-inch length of tubing and install end fittings according to the end fitting manufacturer’s instructions. Conduct the test specified in S6.11 using a plastic air brake tubing assembly.

S13. Test Conditions. Each hose assembly or appropriate part thereof shall be able to meet the requirements of S5, S7, S9, and S11, under the following conditions:

S13.1 The temperature of the testing room is 75 degrees Fahrenheit (24 degrees Celsius).

S13.2 The brake hoses and brake hose assemblies are at least 24 hours old, and unused.

S13.3 Specified test pressures are gauge pressures (psig).

EDITORIAL NOTE: For Federal Register citations affecting § 571.106, see the List of CFR Sections Affected, which appears in the Finding Aids section of the printed volume and on GPO Access.

§ 571.107 [Reserved]

§ 571.108 Standard No. 108; Lamps, reflective devices, and associated equipment.

S1. Scope. This standard specifies requirements for original and replacement lamps, reflective devices, and associated equipment.

S2. Purpose. The purpose of this standard is to reduce traffic accidents and deaths and injuries resulting from traffic accidents, by providing adequate illumination of the roadway, and by enhancing the conspicuity of motor vehicles on the public roads so that their presence is perceived and their signals understood, both in daylight and in darkness or other conditions of reduced visibility.
§ 571.108

Application. This standard applies to:

(a) Passenger cars, multipurpose passenger vehicles, trucks, buses, trailers (except pole trailers and trailer converter dollies), and motorcycles;

(b) Retroreflective sheeting and reflex reflectors manufactured to conform to S5.7 of this standard; and

(c) Lamps, reflective devices, and associated equipment for replacement of like equipment on vehicles to which this standard applies.

Definitions.

Aiming Reference Plane means a plane which is perpendicular to the longitudinal axis of the vehicle and tangent to the forwardmost aiming pad on the headlamp.

Axis of reference means the characteristic axis of the lamp for use as the direction of reference (H = 0°, V = 0°) for angles of field for photometric measurements and for installing the lamp on the vehicle.

Beam contributor means an indivisible optical assembly including a lens, reflector, and light source, that is part of an integral beam headlights system and contributes only a portion of a headlamp beam.

Cargo lamp is a lamp that is mounted on a multipurpose passenger vehicle, truck, or bus for the purpose of providing illumination to load or unload cargo.

Cutoff means a generally horizontal, visual/optical aiming cue in the lower beam that marks a separation between areas of higher and lower luminance.

Direct reading indicator means a device that is mounted in its entirety on a headlamp or headlamp aiming or headlamp mounting equipment, is part of a VHAAD, and provides information about headlamp aim in an analog or digital format.

Effective light-emitting surface means that portion of a lamp that directs light to the photometric test pattern, and does not include transparent lenses, mounting hole bosses, reflex reflector area, beads or rims that may glow or produce small areas of increased intensity as a result of uncontrolled light from an area of 1/2 degree radius around a test point.

Effective projected luminous lens area means the area of the orthogonal projection of the effective light-emitting surface of a lamp on a plane perpendicular to a defined direction relative to the axis of reference. Unless otherwise specified, the direction is coincident with the axis of reference.

Filament means that part of the light source or light emitting element(s), such as a resistive element, the excited portion of a specific mixture of gases under pressure, or any part of other energy conversion sources, that generates radiant energy which can be seen.

Flash means a cycle of activation and deactivation of a lamp by automatic means continuing until stopped either automatically or manually.

Fully opened means the position of the headlamp concealment device in which the headlamp is in the design open operating position.

Headlamp concealment device means a device, with its operating system and components, that provides concealment of the headlamp when it is not in use, including a movable headlamp cover and a headlamp that displaces for concealment purposes.

Headlamp test fixture means a device designed to support a headlamp or headlamp assembly in the test position specified in the laboratory tests and whose mounting hardware and components are those necessary to operate the headlamp as installed in a motor vehicle.

Integral beam headlamp means a headlamp (other than a standardized sealed beam headlamp designed to conform to paragraph S7.3 or a replaceable bulb headlamp designed to conform to paragraph S7.5) comprising an integral and indivisible optical assembly including lens, reflector, and light source, except that a headlamp conforming to paragraph S7.8.5.2 or paragraph S7.8.5.3 may have a lens designed to be replaceable.

Multiple compartment lamp means a device which gives its indication by two or more separately lighted areas which are joined by one or more common parts, such as a housing or lens.

Multiple lamp arrangement means an array of two or more separate lamps on each side of the vehicle which operate together to give a signal.

Remote reading indicator means a device that is not mounted in its entirety
on a headlamp or headlamp aiming or headlamp mounting equipment, but otherwise meets the definition of a direct reading indicator.

Replaceable bulb headlamp means a headlamp comprising a bonded lens and reflector assembly and one or two replaceable headlamp light sources, except that a headlamp conforming to paragraph S7.8.5.2 or paragraph S7.8.5.3 may have a lens designed to be replaceable.

Replaceable light source means an assembly of a capsule, base, and terminals that is designed to conform to the requirements of Appendix A or Appendix B of part 564 Replaceable Light Source Information of this Chapter.

Vehicle headlamp aiming device or VHAD means motor vehicle equipment, installed either on a vehicle or headlamp, which is used for determining the horizontal or vertical aim, or both the vertical and horizontal aim of the headlamp.

Visually/optically aimable headlamp means a headlamp which is designed to be visually/optically aimable in accordance with the requirements of paragraph S7.8.5.3 of this standard.

S5. Requirements.

S5.1 Required motor vehicle lighting equipment.

S5.1.1 Except as provided in succeeding paragraphs of this S5.1.1, each vehicle shall be equipped with at least the number of lamps, reflective devices, and associated equipment specified in Tables I and III and S7, as applicable. Required equipment shall be designed to conform to the SAE Standards or Recommended Practices referenced in those tables. Table I applies to multipurpose passenger vehicles, trucks, trailers, and buses, 80 or more inches in overall width. Table III applies to passenger cars and motorcycles and to multipurpose passenger vehicles, trucks, trailers, and buses, less than 80 inches in overall width.

S5.1.1.1 A truck tractor need not be equipped with turn signal lamps mounted on the rear if the turn signal lamps at or near the front are so constructed (double-faced) and so located that they meet the requirements for double-faced turn signals specified in SAE Standard J588e, Turn Signal Lamps, September 1970.

S5.1.1.2 A truck tractor need not be equipped with any rear side marker devices, rear clearance lamps, and rear identification lamps.

S5.1.1.3 Intermediate side marker devices are not required on vehicles less than 30 feet in overall length.

S5.1.1.4 Reflective material conforming to Federal Specification L-S-300, Sheeting and Tape, Reflective; Non-exposed Lens, Adhesive Backing, September 7, 1965, may be used for side reflex reflectors if this material as used on the vehicle, meets the performance standards in either Table I or Table IA of SAE Standard J594f, Reflex Reflectors, January 1977.

S5.1.1.5 The turn signal operating unit on each passenger car, and multipurpose passenger vehicle, truck, and bus less than 80 inches in overall width shall be self-canceling by steering wheel rotation and capable of cancellation by a manually operated control.

S5.1.1.6 Instead of the photometric values specified in Table 1 of SAE Standards J222 December 1970, or J585e September 1977, a parking lamp or tail lamp, respectively, shall meet the minimum percentage specified in Figure 1a of the corresponding minimum allowable value specified in Figure 1b. The maximum candlepower output of a parking lamp shall not exceed that prescribed in Figure 1b, or of a taillamp, that prescribed in Figure 1b at H or above. If the sum of the percentages of the minimum candlepower measured at the test points is not less than that specified for each group listed in Figure 1c, a parking lamp or taillamp is not required to meet the minimum photometric value at each test point specified in SAE Standards J222 or J585e respectively.

S5.1.1.7 A motorcycle turn signal lamp need meet only one-half of the minimum photometric values specified in Table 1 and Table 3 of SAE J588 NOV84 Turn Signal Lamps.

S5.1.1.8 For each motor vehicle less than 30 feet in overall length, the photometric minimum candlepower requirements for side marker lamps specified in SAE Standard J592e Clearance, Side Marker, and Identification Lamps, July 1972, may be met for all inboard test points at a distance of 15 feet from the vehicle and on a vertical plane that
§ 571.108

is perpendicular to the longitudinal axis of the vehicle and located midway between the front and rear side marker lamps.

S5.1.1.9 A boat trailer whose overall width is 80 inches or more need not be equipped with both front and rear clearance lamps provided an amber (to front) and red (to rear) clearance lamp is located at or near the midpoint on each side so as to indicate its extreme width.

S5.1.1.10 Multiple license plate lamps and backup lamps may be used to fulfill the requirements of the SAE Standards applicable to such lamps referenced in Tables I and III.

S5.1.1.11 A stop lamp that is not optically combined, as defined by SAE Information Report J387 Terminology—Motor Vehicle Lighting NOV87, with a turn signal lamp, shall remain activated when the turn signal lamp is flashing.

S5.1.1.12 On a motor vehicle, except a passenger car, whose overall width is 2032 mm. (80 inches) or more, measurements of the effective projected luminous lens area, and of the photometrics of a multiple compartment stop lamp and a multiple compartment turn signal lamp, shall be made for the entire lamp and not for the individual compartments.

S5.1.1.13 Each passenger car, and each multipurpose passenger vehicle, truck, and bus of less than 80 inches overall width, shall be equipped with a turn signal operating unit designed to complete a durability test of 100,000 cycles.

S5.1.1.14 A trailer that is less than 30 inches in overall width may be equipped with only one taillamp, stop lamp, and rear reflex reflector, which shall be located at or near its vertical centerline.

S5.1.1.15 A trailer that is less than 6 feet in overall length, including the trailer tongue, need not be equipped with front side marker lamps and front side reflex reflectors.

S5.1.1.16 A lamp designed to use a type of bulb that has not been assigned a mean spherical candlepower rating by its manufacturer and is not listed in SAE Standard J573d, Lamp Bulbs and Sealed Units, December 1968, shall meet the applicable requirements of this standard when used with any bulb of the type specified by the lamp manufacturer, operated at the bulb’s design voltage. A lamp that contains a sealed-in bulb shall meet these requirements with the bulb operated at the bulb’s design voltage.

S5.1.1.17 Except for a lamp having a sealed-in bulb, a lamp shall meet the applicable requirements of this standard when tested with a bulb whose filament is positioned within ±0.10 inch of the nominal design position specified in SAE Standard J573d, Lamp Bulbs and Sealed Units, December 1968, or specified by the bulb manufacturer.

S5.1.1.18 A backup lamp is not required to meet the minimum photometric values at each test point specified in Table I of SAE Standard J593c, Backup Lamps, February 1968, if the sum of the candlepower measured at the test points within each group listed in Figure 2 is not less than the group totals specified in that figure.

S5.1.1.19 Each variable load turn signal flasher shall comply with voltage drop and durability requirements of SAE Standard J590b, Turn Signal Flashers, October 1965 with the maximum design load connected, and shall comply with starting time, flash rate, and percent current “on” time requirements of J590b both with the minimum and with the maximum design load connected.

S5.1.1.20 The lowest voltage drop for turn signal flashers and hazard warning signal flashers measured between the input and load terminals shall not exceed 0.8 volt.

S5.1.1.21 A motor-driven cycle whose speed attainable in 1 mile is 30 mph or less need not be equipped with turn signal lamps.

S5.1.1.22 A motor-driven cycle whose speed attainable in 1 mile is 30 mph or less may be equipped with a stop lamp whose effective projected luminous lens area is not less than 3½ square inches and whose photometric output for the groups of test points specified in Figure 1 is at least one-half of the minimum values set forth in that figure.

S5.1.1.23-24 [Reserved]

S5.1.1.25 Each turn signal lamp on a motorcycle shall have an effective projected luminous lens area of not less
than 2258 square mm. (3½ square inches).

S5.1.1.26 On a motor vehicle whose overall width is less than 80 inches:

(a) The effective projected luminous lens area of a single compartment stop lamp, and a single compartment rear turn signal lamp, shall be not less than 50 square centimeters (7¼ square inches).

(b) If a multiple compartment lamp or multiple lamps are used to meet the photometric requirements for stop lamps and rear turn signal lamps, the effective projected luminous lens area of each compartment or lamp shall be at least 22 square centimeters, provided the combined area is at least 50 square centimeters (7¼ square inches).

S5.1.1.27 (a) Except as provided in paragraph (b) of this section, each passenger car manufactured on or after September 1, 1985, and each multipurpose passenger vehicle, truck, and bus, whose overall width is less than 80 inches, whose GVWR is 10,000 pounds or less, manufactured on or after September 1, 1993, shall be equipped with a high-mounted stop lamp which:

(1) Shall have an effective projected luminous lens area not less than 2903 square mm. (4½ square inches).

(2) Shall meet the visibility requirements specified in S5.3.2(c).

(3) Shall have the minimum photometric values in the amount and location listed in Figure 10.

(4) Need not meet the requirements of paragraphs 3.1.6 Moisture Test, 3.1.7 Dust Test, and 3.1.8 Corrosion Test of SAE Recommended Practice J186a, Supplemental High-Mounted Stop and Rear Turn Signal Lamps, September 1977, if it is mounted inside the vehicle.

(5) Shall provide access for convenient replacement of the bulb without the use of special tools.

(b) Each multipurpose passenger vehicle, truck and bus whose overall width is less than 80 inches, whose GVWR is 10,000 pounds or less, whose vertical centerline, when the vehicle is viewed from the rear, is not located on a fixed body panel but separates one or two movable body sections, such as doors, which lacks sufficient space to install a single high-mounted stop lamp on the centerline above such body sections, and which is manufactured on or after September 1, 1993, shall have two high-mounted stop lamps which:

(1) Are identical in size and shape and have an effective projected luminous lens area not less than 1452 square mm. (2¼ square inches) each.

(2) Shall meet the visibility requirements specified in S5.3.2(d).

(3) Together have the minimum photometric values specified in paragraph (a)(3) of this S5.1.1.27.

(4) Shall provide access for convenient replacement of the bulbs without special tools.

S5.1.1.28 [Reserved]

S5.1.1.29 A trailer equipped with a conspicuity treatment in conformance with paragraph S5.7 of this standard need not be equipped with the reflex reflectors required by Table I of this standard if the conspicuity material is placed at the locations of the reflex reflectors required by Table I.

S5.1.2 Plastic materials used for optical parts such as lenses and reflectors shall conform to SAE Recommended Practice J576 JUL91, except that:

(a) Plastic lenses (other than those incorporating reflex reflectors) used for inner lenses or those covered by another material and not exposed directly to sunlight shall meet the requirements of paragraphs 3.3 and 4.2 of SAE J576 JUL91 when covered by the outer lens or other material;

(b) The thickness of the test specimens specified in paragraph 3.2.2 of SAE J576 JUL91 may vary by as much as ±0.25 mm.

(c) After the outdoor exposure test, plastic materials used for reflex reflectors and for lenses used in front of reflex reflectors shall not show surface deterioration, crazing, dimensional changes, color bleeding, delamination, loss of surface luster, or haze that exceeds 7 percent as measured under ASTM D 1003-92.

(d) The thickness of the test specimens specified in paragraph 3.2.2 of SAE J576 JUL91 may vary by as much as ±0.25 mm.

(e) After exposure to the heat test as specified in subparagraph (f) of this paragraph, and after cooling to room
ambient temperature, a test specimen shall show no change in shape and general appearance discernable to the naked eye when compared with an unexposed specimen. The trichromatic coefficients of the samples shall conform to the requirements of SAE J578c, Color Specification for Electric Signal Lighting Devices, February 1977.

(f) Two samples of each thickness of each plastic material are used in the heat test. Each sample is supported at the bottom, with at least 51 mm. of the sample above the support, in the vertical position in such a manner that, on each side, the minimum uninterrupted area of exposed surface is not less than 3225 sq. mm. The samples are placed for two hours in a circulating air oven at 79 ± 3 degrees C.

(g) All outdoor exposure tests shall be 3 years in duration, whether the material is exposed or protected. Accelerated weathering procedures are not permitted.

S5.1.3 No additional lamp, reflective device or other motor vehicle equipment shall be installed that impairs the effectiveness of lighting equipment required by this standard.

5.1.4 Except for multifunction school activity buses, each school bus shall be equipped with a system of either:

(a) Four red signal lamps designed to conform to SAE Standard J887, School Bus Red Signal Lamps, July 1964, and installed in accordance with that standard; or

(b) Four red signal lamps designed to conform to SAE Standard J887, School Bus Red Signal Lamps, July 1964, and four amber signal lamps designed to conform to that standard, except for their color, and except that their candlepower shall be at least 2 1/2 times that specified for red signal lamps. Both red and amber lamps shall be installed in accordance with SAE Standard J887, except that:

(i) Each amber signal lamp shall be located near each red signal lamp, at the same level, but closer to the vertical centerline of the bus; and

(ii) The system shall be wired so that the amber signal lamps are activated only by manual or foot operation, and if activated, are automatically deactivated and the red signal lamps automatically activated when the bus entrance door is opened.

S5.1.5 The color in all lamps, reflective devices, and associated equipment to which this standard applies shall comply with SAE Standard J578c, Color Specification for Electric Signal Lighting Devices, February 1977.

S5.2 Other requirements.

S5.2.1 The words “it is recommended that,” “recommendations,” or “should be” appearing in any SAE Standard or Recommended Practice referenced or subreferenced in this standard shall be read as setting forth mandatory requirements, except that the aiming pads on the lens face and the black area surrounding the signal lamp recommended in SAE Standard J887, School Bus Red Signal Lamps, July 1964, are not required.

S5.2.2 The words “Type 1 (5 3/4””), “Type 2 (5 3/4”),” “Type 2 (7”),” “Type 1A,” “Type 2A,” and “Type 2B” appearing in any SAE Standard or Recommended Practice referenced or subreferenced in this standard shall also be read as setting forth requirements respectively for the following types of headlamps: 1C1, 2C1, 2D1, 1A1, 2A1, and 2B1.

S5.3 Location of required equipment.

Exempt as provided in paragraphs S5.3.2, S5.7, and S7, each lamp, reflective device, and item of associated equipment shall be securely mounted on a rigid part of the vehicle other than glazing that is not designed to be removed except for repair, in accordance with the requirements of Table I and Table III, as applicable, and in the location specified in Table II (multipurpose passenger vehicles, trucks, trailers, and buses 80 or more inches in overall width) or Table IV (all passenger cars, and motorcycles, and multipurpose passenger vehicles, truck, trailers and buses less than 80 inches in overall width), as applicable.

S5.3.1 [Reserved]

S5.3.1.1 [Reserved]

S5.3.1.2 [Reserved]

S5.3.1.3 On a truck tractor, the red rear reflex reflectors may be mounted on the back of the cab, at a minimum height not less than 4 inches above the height of the rear tires.

S5.3.1.4 On a trailer, the amber front side reflex reflectors and amber front
side marker lamps may be located as far forward as practicable exclusive of the trailer tongue.

S5.3.1.4 When the rear identification lamps are mounted at the extreme height of a vehicle, rear clearance lamps need not meet the requirement of Table II that they be located as close as practicable to the top of the vehicle.

S5.3.1.5 [Reserved]

S5.3.1.6 On a truck tractor, clearance lamps mounted on the cab may be located to indicate the width of the cab, rather than the overall width of the vehicle.

S5.3.1.7 On a motor vehicle on which the front turn signal lamp is less than 100 mm from the lighted edge of a lower beam headlamp, as measured from the optical center of the turn signal lamp, the multiplier applied to obtain the required minimum luminous intensities shall be 2.5.

S5.3.1.8 (a) Each high-mounted stop lamp installed in or on a vehicle subject to S5.1.1.27(a) shall be located as follows:

(1) With its center at any place on the vertical centerline of the vehicle, including the glazing, as the vehicle is viewed from the rear.

(2) If the lamp is mounted below the rear window, no portion of the lens shall be lower than 6 inches below the rear window on convertibles, or 3 inches on other passenger cars.

(3) If the lamp is mounted inside the vehicle, means shall be provided to minimize reflections from the light of the lamp upon the rear window glazing that might be visible to the driver when viewed directly, or indirectly in the rearview mirror.

(b) The high-mounted stop lamps installed in or on a vehicle subject to S5.1.1.27(b) shall be located at the same height, with one vertical edge of each lamp on the vertical edge of the body section nearest the vertical centerline.

S5.3.2 Except as provided in S5.3.2.1 through S5.3.2.4 and in paragraphs S5.7 and S7, each vehicle must conform to the following requirements:

(a) Each lamp and reflective device must be installed in a location where it complies with all applicable photometric requirements and visibility requirements, with all obstructions (e.g., mirrors, snow plows, wrecker booms, backhoes, and winches) installed on the vehicle.

(b) A manufacturer must certify compliance of each lamp to one of the following visibility requirement options, and it may not thereafter choose a different option for that vehicle:

(1) When a vehicle is equipped with any lamp listed in Figure 19 of this standard, each such lamp must provide not less than 12.5 square centimeters of unobstructed effective projected luminous lens area in any direction throughout the pattern defined by the corner points specified in Figure 19 for each such lamp; or

(2) When a vehicle is equipped with any lamp listed in Figure 20 of this standard, each such lamp must provide a luminous intensity not less than that specified in Figure 20 in any direction throughout the pattern defined by the corner points specified in Figure 20 for each such lamp. The luminous intensity must be measured in accordance with the photometry test requirements of the applicable SAE Standards and Recommended Practices incorporated by reference or subreference in this standard.

(c) A high mounted stop lamp must have a signal visible to the rear through a horizontal angle from 45 degrees to the left to 45 degrees to the right of the longitudinal axis of the vehicle.

(d) High mounted stop lamps required to comply with S5.1.1.27(b) must together have a signal to the rear as specified in S5.3.2(c).

(e) Backup lamps must be mounted on the rear so that the optical center of at least one lamp is visible from any eye point elevation from at least 1828 mm (6 ft) to 610 mm (2 ft) above the horizontal plane on which the vehicle is standing; and from any position in the area, rearward of a vertical plane perpendicular to the longitudinal axis of the vehicle, 914 mm (3 ft) to the rear of the vehicle and extending 914 mm (3 ft) beyond each side of the vehicle.

S5.3.2.1 Clearance lamps may be located at a location other than on the front and rear if necessary to indicate the overall width of a vehicle, or for protection from damage during normal operation of the vehicle, and at such a
§ 571.108

49 CFR Ch. V (10–1–08 Edition)

location they need not meet the photometric output at any test point that is 45 degrees inboard.

S.5.3.2.2 If any required lamp or reflective device is obstructed by motor vehicle equipment (e.g., mirrors, snow plows, wrecker booms, backhoes, winches, etc.), and cannot meet requirements of S.5.3.2, the vehicle must be equipped with an additional lamp or device of the same type which meet all applicable requirements of this standard, including S.5.3.2.

S.5.3.2.3 For signal lamps and reflective devices mounted less than 750 mm above the road surface as measured to the lamp axis of reference, the vertical test point angles located below the horizontal plane subject to photometric and visibility requirements of this standard may be reduced to 5 degrees.

S.5.3.2.4 As an alternative to S.5.3.2(b), each passenger car and motorcycle, and each multipurpose passenger vehicle, truck, trailer and bus that is of less than 2032 mm overall width, that are manufactured on or before September 1, 2011, and each multipurpose passenger vehicle, truck, trailer and bus that is of less than 2032 mm overall width that is manufactured on or before September 1, 2014, must have each lamp located so that it meets the visibility requirements specified in any applicable SAE Standard or Recommended Practice.

S.5.4 Equipment combinations. Two or more lamps, reflective devices, or items of associated equipment may be combined if the requirements for each lamp, reflective device, and item of associated equipment are met, with the following exceptions:

(a) No high-mounted stop lamp shall be combined with any other lamp or reflective device, other than with a cargo lamp.

(b) No high-mounted stop lamp shall be combined optically, as defined by SAE Information Report J387 Terminology—Motor Vehicle Lighting NOV87, with any cargo lamp.

(c) No clearance lamp shall be combined optically, as defined by SAE Information Report J387 Terminology—Motor Vehicle Lighting NOV87, with any taillamp.

S.5.5 Special wiring requirements.

S.5.5.1 Each vehicle shall have a means of switching between lower and upper beams that conforms to SAE Recommended Practice J564a Headlamp Beam Switching, April 1964 or to SAE Recommended Practice J565b, Semi-Automatic Headlamp Beam Switching Devices, February 1969. Except as provided in S.5.5.8, the lower and upper beams shall not be energized simultaneously except momentarily for temporary signalling purposes or during switching between beams.

S.5.5.2 Each vehicle shall have a means for indicating to the driver when the upper beams of the headlamps are on that conforms to SAE Recommended Practice J564a, April 1964, except that the signal color need not be red.

S.5.5.3 The taillamps on each vehicle shall be activated when the headlamps are activated in a steady-burning state, but need not be activated if the headlamps are activated at less than full intensity as permitted by paragraph S.5.5.11(a).

S.5.5.4 The stop lamps on each vehicle shall be activated upon application of the service brakes. The high-mounted stop lamp on each vehicle shall be activated only upon application of the service brakes.

S.5.5.5 The vehicular hazard warning signal operating unit on each vehicle shall operate independently of the ignition or equivalent switch, and when activated, shall cause to flash simultaneously sufficient turn signal lamps to meet, as a minimum, the turn signal lamp photometric requirements of this standard.

S.5.5.6 Each vehicle equipped with a turn signal operating unit shall also have an illuminated pilot indicator. Failure of one or more turn signal lamps to operate shall be indicated in accordance with SAE Standard J588e, Turn Signal Lamps, September 1970, except when a variable-load turn signal flasher is used on a truck, bus, or multipurpose passenger vehicle 80 or more inches in overall width, on a truck that is capable of accommodating a slide-in camper, or on any vehicle equipped to tow trailers.

S.5.5.7 On each passenger car and motorcycle, and on each multipurpose
passenger vehicle, truck, and bus of less than 80 inches overall width:

(a) When the parking lamps are activated, the taillamps, license plate lamps, and side marker lamps shall also be activated; and

(b) When the headlamps are activated in a steady-burning state, the tail lamps, parking lamps, license plate lamps and side marker lamps shall also be activated.

§5.5.8 On a motor vehicle equipped with a headlighting system designed to conform to the photometric requirements of Figure 15–1 or Figure 15–2, the lamps marked “L” or “LF” may be wired to remain permanently activated when the lamps marked “U” or “UF” are activated. On a motor vehicle equipped with an Integral Beam headlighting system meeting the photometric requirements of paragraph S7.4(a)(1)(i), the lower beam headlamps shall be wired to remain permanently activated when the upper beam headlamps are activated. On a motor vehicle equipped with a headlighting system designed to conform to the requirements of Figure 17–1 or Figure 17–2, a lower beam light source may be wired to remain activated when an upper beam light source is activated if the lower beam light source contributes to compliance of the headlighting system with the upper beam requirements of Figure 17–1 or Figure 17–2.

§5.5.9 Except as provided in section S5.5.8, the wiring harness or connector assembly of each headlamp system shall be designed so that only those light sources intended for meeting lower beam photometrics are energized when the beam selector switch is in the lower beam position, and that only those light sources intended for meeting upper beam photometrics are energized when the beam selector switch is in the upper beam position.

§5.5.10 The wiring requirements for lighting equipment in use are:

(a) Turn signal lamps, hazard warning signal lamps, and school bus warning lamps shall be wired to flash;

(b) Headlamps and side marker lamps may be wired to flash for signaling purposes;

(c) A motorcycle headlamp may be wired to allow either its upper beam or its lower beam, but not both, to modulate from a higher intensity to a lower intensity in accordance with section S5.6;

(d) All other lamps shall be wired to be steady-burning.

§5.5.11(a) Any pair of lamps on the front of a passenger car, multipurpose passenger vehicle, truck, or bus, whether or not required by this standard, other than parking lamps or fog lamps, may be wired to be automatically activated, as determined by the manufacturer of the vehicle, in a steady burning state as daytime running lamps (DRLs) and to be automatically deactivated when the headlamp control is in any “on” position, and as otherwise determined by the manufacturer of the vehicle, provided that each such lamp:

(1) Has a luminous intensity not less than 500 candela at test point H-V, nor more than 3,000 candela at any location in the beam, when tested in accordance with Section S11 of this standard, unless it is:

(i) A lower beam headlamp intended to operate as a DRL at full voltage, or at a voltage lower than used to operate it as a lower beam headlamp; or

(ii) An upper beam headlamp intended to operate as a DRL, whose luminous intensity at test point H-V is not more than 7,000 candela, and which is mounted not higher than 864 mm above the road surface as measured from the center of the lamp with the vehicle at curb weight;

(2) Is permanently marked “DRL” on its lens in letters not less than 3 mm high, unless it is optically combined with a headlamp;

(3) Is designed to provide the same color as the other lamp in the pair, and that is one of the following colors as defined in SAE Standard J578 MAY88: White, white to yellow, white to selective yellow, selective yellow, or yellow;

(4) If not optically combined with a turn signal lamp, is located so that the distance from its lighted edge to the optical center of the nearest turn signal lamp is not less than 100 mm, unless:

(i) The luminous intensity of the DRL is not more than 2,600 candela at any location in the beam and the turn
§ 571.108

49 CFR Ch. V (10–1–08 Edition)

signal meets the requirements of S5.3.1.7; or

(ii) (For a passenger car, multipurpose passenger vehicle, truck, or bus that is manufactured before October 1, 1995, and which uses an upper beam headlamp as a DRL as specified in paragraph S5.5.11(a)(1)(ii) the luminous intensity of the DRL is greater than 2,600 candela at any location in the beam and the turn signal lamp meets the requirements of S5.3.1.7; or

(iii) The DRL is optically combined with a lower beam headlamp and the turn signal lamp meets the requirements of S5.3.1.7; or

(iv) The DRL is deactivated when the turn signal or hazard warning signal lamp is activated.

(5) If optically combined with a turn signal lamp, is automatically deactivated as a DRL when the turn signal lamp or hazard warning lamp is activated, and automatically reactivated as a DRL when the turn signal lamp or hazard warning lamp is deactivated.

(b) Any pair of lamps that are not required by this standard and are not optically combined with any lamps that are required by this standard, and which are used as DRLs to fulfill the specifications of S5.5.11(a), shall be mounted at the same height, which shall be not more than 1.067 m above the road surface measured from the center of the lamp on the vehicle at curb weight, and shall be symmetrically disposed about the vertical centerline of the vehicle.

S5.7 Conspicuity Systems. Each trailer of 80 or more inches overall width, and with a GVWR over 10,000 lbs., manufactured on or after December 1, 1993, except a trailer designed exclusively for living or office use, and each truck tractor manufactured on or after July 1, 1997, shall be equipped with either retroreflective sheeting that meets the requirements of S5.7.1, reflex reflectors that meet the requirements of S5.7.2, or a combination of retroreflective sheeting and reflex reflectors that meet the requirements of S5.7.3.

S5.7.1 Retroreflective sheeting. Each trailer or truck tractor to which S5.7 applies that does not conform to S5.7.2 or S5.7.3 shall be equipped with retroreflective sheeting that conforms to the requirements specified in S5.7.1.1 through S5.7.1.5.

S5.7.1.1 Construction. Retroreflective sheeting shall consist of a smooth, flat, transparent exterior film with retroreflective elements embedded or suspended beneath the film so as to form a non-exposed retroreflective optical system.

S5.7.1.2 Performance requirements. Retroreflective sheeting shall meet the requirements of ASTM D 4956–90, Standard Specification for Retroreflective Sheeting for Traffic Control, for Type V Sheeting, except for the photometric requirements, and shall meet the minimum photometric performance requirements specified in Figure 29.

S5.7.1.3 Sheetting pattern, dimensions, and relative coefficients of retroreflection.

(a) Retroreflective sheeting shall be applied in a pattern of alternating white and red color segments to the sides and rear of each trailer, and to the rear of each truck tractor, and in white to the upper rear corners of each trailer and truck tractor, in the locations specified in S5.7.1.4, and Figures 30–1 through 30–4, or Figure 31, as appropriate.

(b) Except for a segment that is trimmed to clear obstructions, or lengthened to provide red sheeting near red lamps, each white or red segment shall have a length of 300 mm ±150 mm.

(c) Neither white nor red sheeting shall represent more than two thirds of the aggregate of any continuous strip marking the width of a trailer, or any continuous or broken strip marking its length.

(d) Retroreflective sheeting shall have a width of not less than 50 mm (Grade DOT-C2), 75 mm (Grade DOT-C3), or 100 mm (Grade DOT-C4).

(e) The coefficients for retroreflection of each segment of red or white sheeting shall be not less than the minimum values specified in Figure 29 of this standard for grades DOT-C2, DOT-C3, and DOT-C4.

S5.7.1.4 Location. (a) Retroreflective sheeting shall be applied to each trailer and truck tractor as specified below, but need not be applied to discontinuous surfaces such as outside ribs, stake post pickets on platform trailers, and external protruding beams, or to items of equipment such as door hinges.
and lamp bodies on trailers and body joints, stiffening beads, drip rails and rolled surfaces on truck tractors.

(b) The edge of white sheeting shall not be located closer than 75 mm to the edge of the luminous lens area of any red or amber lamp that is required by this standard.

(c) The edge of red sheeting shall not be located closer than 75 mm to the edge of the luminous lens area of any amber lamp that is required by this standard.

§ 571.108

Rear of trailers. Retroreflective sheeting shall be applied to the rear of each trailer as follows, except that Element 2 is not required for container chassis or for platform trailers without bulkheads, and Element 3 is not required for trailers without underride protection devices:

(a) Element 1: A strip of sheeting, as horizontal as practicable, in alternating colors across the full width of the trailer, as close to the extreme edges as practicable, and as close as practicable to not less than 375 mm and not more than 1525 mm above the road surface at the stripe centerline with the trailer at curb weight.

(b) Element 2: Two pairs of white strips of sheeting, each pair consisting of strips 300 mm long of grade DOT-C2, DOT-C3, or DOT-C4, applied horizontally and vertically to the right and left upper contours of the body, as viewed from the rear, as close to the top of the trailer and as far apart as practicable. If the perimeter of the body, as viewed from the rear, is other than rectangular, the strips may be applied along the perimeter, as close as practicable to the uppermost and outermost areas of the rear of the body on the left and right sides.

(c) Element 3: A strip of sheeting in alternating colors across the full width of the horizontal member of the rear underride protection device. Grade DOT-C2 material not less than 38 mm wide may be used.

Side of trailers. Retroreflective sheeting shall be applied to each side of a trailer as follows:

(a) A strip of sheeting, as horizontal as practicable, in alternating colors, originating and terminating as close to the front and rear as practicable, as close as practicable to not less than 375 mm and not more than 1525 mm above the road surface at the stripe centerline with the trailer at curb weight, except that at the location chosen the strip shall not be obscured in whole or in part by other motor vehicle equipment or trailer cargo. The strip need not be continuous as long as not less than half of the length of the trailer is covered and the spaces are distributed as evenly as practicable.

(b) If necessary to clear rivet heads or other similar obstructions, grade DOT-C2 retroreflective sheeting may be separated into two 25 mm wide strips of the same length and color, separated by a space of not more than 25 mm, and used in place of the retroreflective sheeting that would otherwise be applied.

Rear of truck tractors. Retroreflective sheeting shall be applied to the rear of each truck tractor as follows:

(a) Element 1: Two strips of sheeting in alternating colors, each not less than 600 mm long, located as close as practicable to the edges of the rear fenders, mudflaps, or the mudflap support brackets, to mark the width of the truck tractor. The strips shall be mounted as horizontal as practicable, in a vertical plane facing the rear, on the rear fenders, on the mudflap support brackets, on plates attached to the mudflap support brackets, or on the mudflaps. Strips on mudflaps shall be mounted not lower than 300 mm below the upper horizontal edge of the mudflap. If the vehicle is certified with temporary mudflap support brackets, the strips shall be mounted not lower than 300 mm below the upper horizontal edge of the mudflap. For a truck tractor without mudflaps, the strips may be mounted outboard of the frame on brackets behind the rear axle or on brackets ahead of the rear axle and above the top of the tires at unladen vehicle height, or they may be mounted directly or indirectly to the back of the cab as close to the outer edges as practicable, above the top of the tires, and not more than 1525 mm above the road surface at unladen vehicle height. If the strips are mounted on the back of the cab, no more than 25 percent of their cumulative area may...
be obscured by vehicle equipment as determined in a rear orthogonal view.

(b) Element 2: Two pairs of white strips of sheeting, each pair consisting of strips 300 mm long, applied as horizontally and vertically as practicable, to the right and left upper contours of the cab, as close to the top of the cab and as far apart as practicable. No more than 25 percent of their cumulative area may be obscured by vehicle equipment as determined in a rear orthogonal view. If one pair must be relocated to avoid obscuration by vehicle equipment, the other pair may be relocated in order to be mounted symmetrically. If the rear window is so large as to occupy all the practicable space, the material may be attached to the edge of the window itself.

S5.7.1.5 Certification. The letters DOT-C2, DOT-C3, or DOT-C4, as appropriate, constituting a certification that the retroreflective sheeting conforms to the requirements of S5.7.1.2, shall appear at least once on the exposed surface of each white or red segment of retroreflective sheeting, and at least once every 300 mm on retroreflective sheeting that is white only. The characters shall be not less than 3 mm high, and shall be permanently stamped, etched, molded, or printed in indelible ink.

S5.7.2 Reflex Reflectors. Each trailer or truck tractor to which S5.7 applies that does not conform to S5.7.1 or S5.7.3 shall be equipped with reflex reflectors in accordance with this section.

S5.7.2.1 (a) Each reflex reflector shall conform to SAE Standard J594f, Reflex Reflectors, January 1977.

(b) Each red reflex reflector shall also provide, at an observation angle of 0.2 degree, not less than 300 millimicandelas/lux at any light entrance angle between 30 degrees left and 30 degrees right, including an entrance angle of 0 degree, and not less than 75 millimicandelas/lux at any light entrance angle between 20 degrees right to 20 degrees left.

(c) Each white reflex reflector shall also provide at an observation angle of 0.2 degree, not less than 1250 millimicandelas/lux at any light entrance angle between 30 degrees left and 30 degrees right, including an entrance angle of 0 degree, and not less than 300 millimicandelas/lux at any light entrance angle between 45 degrees left and 45 degrees right.

(d) A white reflex reflector complying with S5.7.2.1(a) and (c) when tested in a horizontal orientation may be installed in all orientations specified for rear upper locations in S5.7.1.4.1(b) or S5.7.1.4.3(b) if, when tested in a vertical orientation, it provides an observation angle of 0.2 degree not less than 1680 millimicandelas/lux at a light entrance angle of 0 degree, not less than 1120 millimicandelas/lux at any light entrance angle from 10 degrees down to 10 degrees up, and not less than 560 millimicandelas/lux at any light entrance angle from 20 degrees right to 20 degrees left.

S5.7.2.2 Reflex reflectors shall be installed and located as specified below:

(a) In the same locations and in the same length in which retroreflective sheeting is required by S5.7.1.4 to be applied in alternating colors, reflex reflectors shall be installed in a repetitive pattern of two or three white reflex reflectors alternating with two or three red reflex reflectors, with the center of each reflector not more than 100 mm from the center of each adjacent reflector.

(b) In the same locations and in the same length in which white retroreflective sheeting is required by S5.7.1.4 to be installed, white reflex reflectors shall be installed, with the center of each white reflex reflector not more than 100 mm from the center of each adjacent reflector.

S5.7.2.3 Certification. The exposed surface of each reflex reflector shall be marked with the letters DOT-C which constitutes a certification that the reflector conforms to all applicable requirements of §571.108 of this part. The certification shall be not less than 3 mm high, and permanently stamped, etched, molded or printed in indelible ink.

S5.7.3 Combination of sheeting and reflectors. Each trailer or truck tractor to which S5.7 applies that does not conform to S5.7.1 or S5.7.2, shall be equipped with retroreflective materials that meet the requirements of S5.7.1 except that reflex reflectors that meet the requirements of S5.7.2.1, and that
are installed in accordance with §5.7.2.2. may be used instead of any corresponding element of retroreflective sheeting located as required by §5.7.1.4.

§5.8 Replacement Equipment.

§5.8.1 Except as provided below, each lamp, reflective device, or item of associated equipment manufactured to replace any lamp, reflective device, or item of associated equipment on any vehicle to which this standard applies, shall be designed to conform to this standard.

§5.8.2 A Type C replacement headlamp designed to conform to the requirements of paragraph S7.3.2(a) through (d) of this standard may be marked “1” and “2” rather than “1C1” and “2C1” respectively. A Type D replacement headlamp designed to conform to S7.3.2(a) through (c) and S7.3.5(b) of this standard may be marked “TOP” or “2” rather than “2D1”.

§5.8.3 (a) Each stop lamp manufactured to replace a stop lamp that was designed to conform to SAE Standard J586b, Stop Lamps, June 1966, may also be designed to conform to J586c. It shall meet the photometric minimum candlepower requirements for Class A red turn signal lamps specified in SAE Standard J575d, Tests for Motor Vehicle Lighting Devices and Components, August 1967. Each such lamp manufactured for use on a passenger car and on a multipurpose passenger vehicle, truck, trailer or bus less than 80 inches in overall width shall have an effective projected luminous area not less than 3 1/2 square inches. If multiple compartment lamps or multiple lamps are used, the effective projected luminous area of each compartment or lamp shall be not less than 3 1/2 square inches; however, the photometric requirements may be met by a combination of compartments or lamps. Each such lamp manufactured for use on a multipurpose passenger vehicle, truck, trailer or bus 80 inches or more in overall width shall have an effective projected luminous area not less than 12 square inches.

(b) Each turn signal lamp manufactured to replace a turn signal lamp that was designed to conform to SAE Standard J588c, Turn Signal Lamps, September 1970, may also be designed to conform to SAE Standard J588d. Instead of the photometric values specified in SAE Standards J586c and J588e, a stop lamp manufactured to replace a stop lamp designed to conform to SAE Standard J586c, or a turn signal lamp manufactured to replace a turn signal lamp designed to conform to SAE Standard J588c, shall meet the minimum percent of the minimum allowable value specified in Figure 1a of the corresponding minimum photometric value specified in Figure 1b. The maximum candlepower output of each such stop lamp or turn signal lamp shall not exceed that prescribed in Figure 1b. If the sum of the percentages of the minimum candlepower measured at the test points is not less than that specified for each group listed in Figure 1c, a stop lamp or turn signal lamp is not required to meet the minimum photometric value at each test point specified in SAE Standards J586c and J588e, respectively.
S5.8.7 Note 6 of Table 1 in SAE Standard J588e, Turn Signal Lamps, September 1970, does not apply.

S5.8.8 Each taillamp manufactured to replace a taillamp designed to conform to SAE Standard J585d, Tail Lamps, August 1970, may also be designed to conform to J585d.

S5.8.9 Each turn signal lamp manufactured to replace a turn signal lamp (on a motorcycle) that was designed to conform to SAE Standard J588d, Turn Signal Lamps, June 1966, may also be designed to conform to J588d.

S5.8.10 Unless otherwise specified in this standard, each lamp, reflective device, or item of associated equipment to which paragraph S5.8.1 applies may be labeled with the symbol DOT, which shall constitute a certification that it conforms to applicable Federal motor vehicle safety standards.

S5.8.11 A replacement lens for a replaceable bulb headlamp or an integral beam headlamp that is not required to have a bonded lens shall be provided with a replacement seal in a package that includes instructions for the removal and replacement of the lens, the cleaning of the reflector, and the sealing of the replacement lens to the reflector assembly.

S6. Subreferenced SAE Standards and Recommended Practices

S6.1 SAE Standards and Recommended Practices subreferenced by the SAE Standards and Recommended Practices included in Tables I and III and paragraphs S5.1.4 and S5.5.1 are those published in the 1970 edition of the SAE Handbook, except that the SAE standard referred to as “J575” is J575e, Tests for Motor Vehicle Lighting Devices and Components, August 1970, for stoplamps designed to conform to SAE Standards J586c, J586 FEB84, and J1398 MAY85; for taillamps designed to conform to SAE Standards J585d and J585e; for turn signal lamps designed to conform to SAE Standards J588e, J588 NOV84, and J1395 APR85; and for high-mounted stoplamps designed to conform to SAE Recommended Practice J186a. The reference in J585e to J256 does not apply. For headlamps other than motorcycle headlamps, unless otherwise specified in this standard, the version of SAE Standard J575 is DEC88, and the version of SAE Standard J602 is OCT80.

The definition of “optically combined” in SAE Information Report J387 Terminology—Motor Vehicle Lighting NOV87, applies to that term as used in J586c and J588e.

S6.2 Requirements of SAE Standards incorporated by reference in this standard, other than J570b and J576c, do not include test for warpage of devices with plastic lenses.

S6.3 The term “functional lighted lens area” in any SAE Standard or Recommended Practice incorporated by reference or by subreference in this standard, has the same meaning as the term “effective projected luminous lens area.”

S7. Headlighting requirements.

S7.1 Each passenger car, multipurpose passenger vehicle, truck, and bus manufactured on or after September 1, 1994, shall be equipped with a headlighting system designed to conform to the requirements of S7.3, S7.4, S7.5, or S7.6.

S7.2(a) The lens of each original and replacement equipment headlamp, and of each original equipment and replacement equipment beam contributor shall be marked with the symbol “DOT” either horizontally or vertically which shall constitute the certification required by 49 U.S.C. 30115.

(b) The lens of each headlamp and of each beam contributor manufactured on or after December 1, 1989, to which paragraph (a) of this section applies shall be marked with the name and/or trademark registered with the U.S. Patent and Trademark Office of the manufacturer of such headlamp or beam contributor, or its importer, or any manufacturer of a vehicle equipped with such headlamp or beam contributor. Nothing in this paragraph shall be construed to authorize the marking of any such name and/or trademark by one who is not the owner, unless the owner has consented to it.

(c) Each headlamp and beam contributor to which paragraph (a) of this section applies shall be marked with its voltage and with its part or trade number.

(d) Unless stated otherwise, a tolerance of ±1⁄4 degree is permitted during photometric performance tests for any headlamp or beam contributor, and the...
(e) Each replacement headlamp lens with seal, provided in accordance with S5.8.11, when installed according to the lens manufacturer’s instructions on an integral beam or replaceable bulb headlamp, shall not cause the headlamp to fail to comply with any of the requirements of this standard. Each replacement headlamp lens shall be marked with the symbol “DOT”, either horizontally or vertically, to constitute certification. Each replacement headlamp lens shall also be marked with the manufacturer and the part or trade number of the headlamp for which it is intended, and with the name and/or trademark of the lens manufacturer or importer that is registered with the U.S. Patent and Trademark Office. Nothing in this paragraph shall be construed to authorize the marking of any such name and/or trademark by one who is not the owner, unless the owner has consented to it.

S7.3 Sealed beam headlighting system. A sealed beam headlighting system shall be designed to meet the requirements of one of the following subparagraphs of S7.3.2 through S7.3.9. In references to Figures in SAE J1383 APR85 for headlamp dimensional requirements, only those dimensions marked “1” for interchangeability are applicable.

S7.3.1 The lens of each sealed beam headlamp designed to conform to S7.3.2 through S7.3.6 shall be marked according to paragraph 5.4.3 through 5.4.5 of SAE Standard J1383 APR85 Performance Requirements for Motor Vehicle Headlamps.

S7.3.2 Type A headlighting system. A Type A headlighting system consists of two Type 1A1 and two Type 2A1 headlamps and associated hardware, which are designed to conform to the following requirements:

(a) SAE Standard J1383 APR85 Performance Requirements for Motor Vehicle Headlamps, with the following exceptions:

(1) Paragraphs 1, 2.1.2, 2.8.2, 3, 4.1.1, 4.1.2, 4.1.3, 4.4, 4.6, 4.8 through 4.18, 5.1.1, 5.1.3, 5.1.5, 5.1.7 through 5.1.16, 5.2.2, 5.3.5, 5.4.1, 5.4.2, and 6 through 6.4 do not apply.

(2) In paragraph 5.3.2, the words “and retaining rings” are omitted.

(3) In paragraphs 4.5.2 and 5.1.6, the words “Figure 28–1 or 28–2 of Motor Vehicle Safety Standard No. 108” are substituted for “Table 3.”

(b) SAE Standard J580 DEC86 Sealed Beam Headlamp Assembly (except paragraphs 3, 4.1.1, 5.1.1.1, 5.1.2.3, and the second sentence of 5.1.6); in 5.2.1, delete the words “and retaining rings;” the correct reference is SAE J1383 Figures 6, 9, 12 and 14.

(c) After a vibration test conducted in accordance with paragraph S8.8, there shall be no evidence of loose or broken parts, other than filaments, visible without magnification.

(d) The maximum wattage at 12.8 volts (design voltage): Single filament headlamp, 55 watts on the upper beam; dual filament headlamp, 43 watts on the upper beam and 65 watts on the lower beam.

S7.3.3 Type B headlighting system. A Type B headlighting system consists of two Type 2B1 headlamps and associated hardware, which are designed to conform to the following requirements:

(a) The requirements of paragraph S7.3.2 (a) through (c), except that the words “Figure 27–1 or Figure 27–2” are substituted for “Table 3’’ in paragraph S7.3.2(a)(3).

(b) The maximum wattage at 12.8 volts (design voltage): 70 watts on the upper beam and 60 watts on the lower beam.

S7.3.4 Type C headlighting system. A Type C headlighting system consists of two Type 1C1 and two Type 2C1 headlamps and associated hardware, which are designed to conform to the requirements of paragraph S7.3.2 (a) through (d), except that the words “Figure 28–1 or Figure 28–2” are substituted for “Table 3’’ in paragraph S7.3.2(a)(3).

S7.3.5 Type D headlighting system. (a) A Type D headlighting system consists of two Type 2D1 headlamps and associated hardware, which are designed to conform to the requirements of paragraph S7.3.2 (a) through (c), except that
the words “Figure 27–1 or Figure 27–1” are substituted for “Table 3” in paragraph S7.3.2(a)(3).

(b) The maximum wattage at 12.8 volts (design voltage): 65 watts on upper beam, and 55 watts on lower beam.

S7.3.6 Type E headlighting system. (a) A Type E headlighting system consists of two Type 2E1 headlamps and associated hardware, which are designed to conform to the requirements of paragraph S7.3.2 (a) through (c), except that the words “Figure 27–1 or Figure 27–1” are substituted for “Table 3” in paragraph S7.3.2(a)(3).

(b) The maximum wattage at 12.8 volts (design voltage): 70 watts on upper beam, and 60 watts on lower beam.

S7.3.7 Type F headlighting system. A Type F headlighting system consists of two Type UF and two Type LF headlamps and associated hardware, which are designed to conform to the following requirements:

(a) Figures 11, 12, 13, and 14 as appropriate.

(b) The photometric requirements of Figure 15–1 or Figure 15–2 of this standard. A reaim tolerance of ±¼ degree is allowed for any test point on the Type LF lamp when tested alone, but is not allowed on the Type UF lamp when tested alone. For the test point 10U–90U, measurement shall be from the normally exposed surface of the lens face.

(c) SAE Standard J1383 APR85 Performance Requirements for Motor Vehicle Headlamps, Sections 2.4, 2.5, 2.6, 4.1, 4.1.4, and 5.1.4.

(d) When tested in accordance with section (c), the mounted assembly (either Type UF or Type LF headlamps, respective mounting ring, aiming ring, and aim adjustment mechanism) shall be designed to conform to the requirements of Figure 15–1 or Figure 15–2 for upper or lower beams respectively without reaim when any conforming Type UF or LF headlamp is tested and replaced by another conforming headlamp of the same Type.

(e) SAE J580 DEC86 Sealed Beam Headlamp Assembly with the following exceptions:

(1) Section 2.2 Mounting Ring reads: “the adjustable ring upon which the sealed beam unit is mounted and which forces the sealed beam unit to seat against the aiming ring when assembled into a sealed beam assembly.”

(2) The definition “2.3 Aiming Ring” reads: “The clamping ring that retains the sealed beam unit against the mounting ring, and that provides an interface between the unit’s aiming/seating pads and the headlamp aimer adapter (locating plate).”

(3) Section 4.1.1 Vibration Test does not apply.

(4) Sections 5.1.1.1 and 5.1.2.3 do not apply.

(5) Section 5.1.2.1 reads: “When the headlamp assembly is tested in the laboratory, a minimum aiming adjustment of ±2.5 degrees shall be provided in the horizontal plane and ±4 degrees in the vertical plane.”

(6) Section 5.1.2.2 concludes: “* * * through an angle of ±2.5 degrees and ±4 degrees respectively.”

(7) Section 5.1.6 is retitled “Retaining Ring/Aiming Ring Tests”. The phrase “92×150 mm * * 0.340 in (8.6 mm)” is added at the end of the table for flange thickness. The sentence beginning “The fastening means” is deleted.

(8) Figures 2, 3, and 4 do not apply, and the reference to them in section 4.5 is replaced by “Figure 16, Deflectometer, of Federal Motor Vehicle Safety Standard No. 108.”

(f) A lens for a Type F headlamp incorporating an upper beam shall be labeled “UF.” A lens for a Type F headlamp incorporating a lower beam shall be labeled “LF”. The face of letters, numbers, or other symbols molded on the surface of the lens shall not be raised more than 0.020 in (0.5 mm), and shall be placed no closer to the geometric center of the lens than 1.375 in. (35 mm). The marking shall be molded in the lens and shall be not less than 1⁄4 in. (6.35 mm) in size.

(g) The maximum wattage at 12.8 volts (design voltage): 70 watts on the upper beam and 60 watts on the lower beam.

(h) Type F headlamps may be mounted on common or parallel seating and aiming planes to permit simultaneous aiming of both headlamps provided that when tested with any conforming Type UF and LF headlamps according to Section S10:
(1) The assembly (consisting of the Type UF and LF headlamps, mounting rings, the aiming/seating rings, and aim adjustment mechanism) shall be designed to conform to the test points of Figure 15–1 or Figure 15–2.

(2) There shall be no provision for adjustment between the common or parallel aiming and seating planes of the two lamps.

(i) After a vibration test conducted in accordance with paragraph S8.8, the Type F system shall show no evidence of loose or broken parts, other than filaments, visible without magnification.

S7.3.8 Type G headlighting system. A Type G headlamp system consists of two Type 1G1 headlamps and two Type 2G1 headlamps each of which is designed to conform to the following requirements:

(a) Figures 18 and 21.

(b) SAE Standard J1383 APR85 Performance Requirements for Motor Vehicle Headlamps (except paragraphs 1, 2.1.2, 2.8.2, 3.4.1.1, 4.1.2, 4.1.3, 4.4, 4.6, 4.8 through 4.18, 5.1.1, 5.1.3, 5.1.5 through 5.1.16, 5.2.2, 5.3.5 through 6.4). In paragraph 5.3.2 the words “and retaining rings” are omitted. In paragraph 4.5.2, the words “either Figure 28–1, or Figure 28–2” are substituted for “Table 3”.

(c) SAE Standard J580 DEC86 Sealed Beam Headlamp Assembly, with the following exceptions:

(1) Sections 2.2, 2.3, 4.1.1, 5.1.1.1, 5.1.2.3, 5.1.6, and 5.2.1.

(2) Section 4.5 reads: “Torque Deflection Test. The headlamp assembly to be tested shall be mounted in the designed vehicle position and set at nominal aim (0.0). A special adapter (Figure 22) for the deflectometer (Figure 16) shall be clamped onto the headlamp assembly. A torque of 20 in.-lbs (2.25 N-m) shall be applied to the headlamp assembly through the deflectometer, and a reading on the thumb wheel shall be taken. The torque shall be removed and a second reading on the thumb wheel shall be taken.”

(d) After a vibration test conducted in accordance with paragraph S8.8, there shall be no evidence of loose or broken parts, other than filaments, visible without magnification.

(e) The maximum wattage at 12.8 volts (design voltage) for the 1G1 and 2G1 upper beam is 55 watts and 43 watts respectively; for the 2G1 lower beam, 65 watts.

(f) A lens for a Type G headlamp incorporating only part of an upper beam shall be labeled “1G1.” A lens for a Type G headlamp incorporating both part of an upper beam and a lower beam shall be labeled “2G1.” The face of letters, numbers, or other symbols molded on the surface of the lens shall not be raised more than 0.020 in. (0.5 mm.), and shall be placed no closer to the geometric center of the lens than 1.375 in. (35 mm). The marking shall be molded in the lens and shall be not less than ¼ in. (6.35 mm) in size.

S7.3.9 Type H headlighting system. A Type H headlamp system consisting of two Type 2H1 headlamps and associated hardware, which are designed to conform to the following requirements:

(a) Paragraphs S7.3.8 (a) through (d) except that in paragraph S7.3.8(b), the words “Figure 27–1 or Figure 27–2” are substituted for “Table 3”.

(b) The maximum wattage at 12.8 volts (design voltage): 70 watts on the upper beam and 60 watts on the lower beam.

(c) A lens for a Type H headlamp incorporating both an upper beam and a lower beam shall be labeled “2H1.” The face of letters, numbers, or other symbols molded on the surface of the lens shall not be raised more than 0.020 in. (0.5 mm), and shall be placed no closer to the geometric center of the lens than 1.375 in. (35 mm). The marking shall be molded in the lens and shall be not less than ¼ in. (6.35 mm) in size.

S7.4 Integral Beam Headlighting System. An integral beam headlighting system shall be designed to conform to the following requirements:

(a) The system shall provide in total not more than two upper beams and two lower beams of the performance described in one of the following:

(1) In a four-headlamp system, each upper beam headlamp and each lower beam headlamp shall be designed to conform to the photometrics of one of the following:

(i) Figure 15–1 or Figure 15–2; or

(ii) Figure 15–1 or Figure 15–2, except that the upper beam test value at 2.5 D-V and 2.5D–12R and 12L shall apply to the lower beam headlamp and not to
the upper beam headlamp, and the upper beam test point value at 1.5D–9R and 9L shall be 1000; or
(iii) Figure 28–1 or Figure 28–2.
(2) In a two-headlamp system, each headlamp shall be designed to conform to the photometrics of one of the following:
(i) Figure 17–1 or Figure 17–2; or
(ii) Figure 27–1 or Figure 27–2.
(3) In a system in which there is more than one beam contributor providing a lower beam, and/or more than one beam contributor providing an upper beam, each beam contributor in the system shall be designed to meet only the photometric performance requirements of Figure 15–1 or Figure 15–2 based upon the following mathematical expression: conforming test point value = 2 (Figure 15–1 or Figure 15–2 test point value)/total number of lower or upper beam contributors for the vehicle, as appropriate. The system shall be designed to use the Vehicle Headlamp Aiming Device (VHAD) as specified in paragraph S7.8.5.2.
(b) The lower and upper beams shall be provided only as follows where each headlamp contains two light sources:
(1) The lower beam shall be provided either by the most outboard light source (or the uppermost if arranged vertically), or by all light sources.
(2) The upper beam shall be provided either by the most inboard light source (or the lowermost if arranged vertically), or by all light sources.
(c) The lower and upper beams shall be provided only as follows where each headlamp contains a single light source:
(1) The lower beam shall be provided by the most outboard headlamps (or the uppermost if arranged vertically), and the lens of each such headlamp shall be permanently marked with the letter “L.”
(2) The upper beam shall be provided by the most inboard headlamps (or lowermost if arranged vertically), and the lens of each such headlamp shall be permanently marked with the letter “U.”
(d) A headlamp or beam contributor designed to meet paragraphs (a)(1) or (a)(3) of this section and S7.8.5.1 may be mounted in an assembly to permit simultaneous aiming of the beam(s) contributors, provided that with any complying contributor the assembly complete with all lamps meets the appropriate photometric requirements when tested in accordance with S10.
(e) Each integral beam headlamp system shall be designed to conform to the applicable photometric performance requirements in paragraph (a) of this section when tested in accordance with sections 4.1 and 4.1.4 of SAE Standard J1383 APR85 with any headlamps intended for use in such system. The term “aiming plane” means “aiming reference plane,” or an appropriate vertical plane defined by the manufacturer as required in paragraph S7.8.1.
(f) The system shall be aimable in accordance with the requirements of paragraph S7.8. A system that incorporates any headlamp or beam contributor that does not have a VHAD as an integral and indivisible part of the headlamp or beam contributor shall be designed so that the appropriate photometrics are met when any correctly aimed and photometrically conforming headlamp or beam contributor is removed from its mounting and aiming mechanism, and is replaced without realignment by any conforming headlamp or beam contributor of the same type.
(g) A headlamp with a glass lens need not meet the abrasion resistance test (S8.2). A headlamp with a nonreplaceable glass lens need not meet the chemical resistance test (S8.3). A headlamp with a glass lens and a non-plastic reflector need not meet the internal heat test of paragraph S8.6.2. A headlamp of sealed design as verified in paragraph S8.9 (sealing) need not meet the corrosion (S8.4), dust (S8.5), or humidity (S8.7) tests; however, the headlamp shall meet the requirements of paragraphs 4.1, 4.1.2, 4.4 and 5.1.4 for corrosion and connector of SAE Standard J580 DEC86 Sealed Beam Headlamp Assembly. An integral beam headlamp may incorporate light sources that are replaceable and are used for purposes other than headlighting.
(h) When tested according to any of the procedures indicated in subparagraphs (1) through (7) each headlamp or beam contributor shall meet the appropriate requirement:
(1) After an abrasion test conducted in accordance with paragraph S8.2, the
headlamp shall meet the photometric requirements applicable to the headlamp system under test.

(2) After the chemical resistance tests of paragraphs S8.3 and S8.10.1, the headlamp shall have no surface deterioration, coating delamination, fractures, deterioration of bonding or sealing materials, color bleeding or color pickup visible without magnification, and the headlamp shall meet the photometric requirements applicable to the headlamp system under test.

(3) After a corrosion test conducted in accordance with paragraph S8.4, there shall be no evidence of external or internal corrosion or rust visible without magnification. After a corrosion test conducted in accordance with paragraph S8.10.2, there shall be no evidence of corrosion or rust visible without magnification on any part of the headlamp reflector that receives light from a headlamp light source, on any metal light or heat shield assembly, or on a metal reflector of any other lamp not sealed from the headlamp reflector. Loss of adhesion of any applied coating shall not occur more than 0.125 in. (3.2 mm) from any sharp edge on the inside or outside. Corrosion may occur on terminals only if the current produced during the test of paragraph S8.4(c) is not less than 9.7 amperes.

(4) After a dust test conducted in accordance with paragraph S8.5, the headlamp shall meet the photometric requirements applicable to the headlamp system under test.

(5) The headlamp shall first meet the requirements of subparagraph (i) and then those of subparagraph (ii).

(i) After a temperature cycle test conducted in accordance with paragraph S8.6.1, the headlamp shall show no evidence of delamination, fractures, entry of moisture or deterioration of bonding material, color bleeding, warpage or deformation visible without magnification or lens warpage greater than .118 in. (3 mm) when measured parallel to the optical axis at the point of intersection of the axis of each light source with the exterior surface of the lens, and it shall meet the photometric requirements applicable to the headlamp system under test.

(ii) After an external heat test conducted in accordance with paragraph S8.6.2, there shall be no lens warpage greater than .118 in. (3 mm) when measured parallel to the optical axis at the point of intersection of the axis of each light source with the exterior surface of the lens, and it shall meet the photometric requirements applicable to the headlamp system under test.

(6) After a humidity test conducted in accordance with paragraph S8.7, the inside of the headlamp shall show no evidence of delamination or moisture, fogging or condensation visible without magnification.

(7) After a vibration test conducted in accordance with paragraph S8.8, there shall be no evidence of loose or broken parts, other than filaments, visible without magnification.

(i) An integral beam headlamp may incorporate replaceable light sources that are used for purposes other than headlighting.

S7.5 Replaceable bulb headlamp system. Each replaceable bulb headlamp system shall be designed to conform to the following requirements:

(a) The system shall provide only two lower beams and two upper beams and shall incorporate not more than two replaceable light sources in each headlamp.

(b) The photometrics as specified in subparagraphs (c) through (e) of this paragraph (depicted in Figure 26), using any light source of the Type intended for use in such system.

(c) The test requirements of sections 4.1, 4.1.4, and performance requirements of section 5.1.4 of SAE J1383 APR85, using the photometric requirements specified in subparagraphs (d) and (e) of this paragraph.

(d) For a headlamp equipped with dual filament replaceable light sources, the following requirements apply:

(1) Headlamps designed to conform to the external aiming requirements of S7.8.5.1 shall have no mechanism that allows adjustment of an individual light source, or, if there are two light sources, independent adjustments of each reflector.

(2) The lower and upper beams of a headlamp system consisting of two lamps, each containing either one or two replaceable light sources, shall be provided as follows:
(i) The lower beam shall be provided in one of the following ways:
   (A) By the outboard light source (or upper one if arranged vertically) designed to conform to:
      (1) The lower beam requirements of Figure 27–1 or Figure 27–2, or Figure 17–1 or Figure 17–2, if the light sources in the headlamp system are any combination of dual filament replaceable light sources other than Type HB2; or
      (2) The lower beam requirements of Figure 17–1 or Figure 17–2 if the light sources are Type HB2, or any dual filament replaceable light sources that include Type HB2; or
   (B) By both light sources in the headlamp, designed to conform to the lower beam requirements specified above.
   (ii) The upper beam shall be provided in one of the following ways:
      (A) By the inboard light source (or the lower one if arranged vertically) designed to conform to:
         (1) The upper beam requirements of Figure 27–1 or Figure 27–2, or Figure 17–1 or Figure 17–2 if the light sources in the headlamp system are any combination of dual filament replaceable light sources other than Type HB2; or
         (2) The upper beam requirements of Figure 17–1 or Figure 17–2 if the light sources are Type HB2, or dual filament light sources other than Type HB1 and Type HB5. The lens of each such headlamp shall be marked with the letter "L".
   (B) By both light sources in the headlamp, designed to conform to the upper beam requirements specified above.

(3) The lower and upper beams of a headlamp system consisting of four lamps, each containing a single replaceable light source, shall be provided as follows:
   (i) The lower beam shall be provided by the outboard lamp (or the upper one if arranged vertically), designed to conform to:
      (A) The lower beam requirements of Figure 27–1 or Figure 27–2, or Figure 15–1 or Figure 15–2 if the light sources in the headlamp system are any combination of dual filament light sources other than Type HB2; or
      (B) The lower beam requirements of Figure 15–1 or Figure 15–2 if the light sources are Type HB2, or dual filament light sources other than Type HB1 and HB5. The lens of each such headlamp shall be marked with the letter "L".
   (ii) The upper beam shall be provided by the inboard lamp (or the lower one if arranged vertically), designed to conform to:
      (A) The upper beam requirements of Figure 27–1 or Figure 27–2, if the light sources in the headlamp system are any combination of dual filament light sources other than Type HB2; or
      (B) The upper beam requirements of Figure 15–1 or Figure 15–2 if the light sources are Type HB1 and Type HB5. The lens of each such headlamp shall be marked with the letter "u".

(e) The following requirements apply to a headlamp system equipped with any combination of replaceable light sources except those specified in paragraph (d) of this section:
   (1) Headlamps designed to conform to the external aim requirements of S7.8.5.1 shall have no mechanism that allows adjustment of an individual light source, or, if there are two replaceable light sources, independent adjustment of each reflector.
   (2) The lower and upper beams of a headlamp system consisting of two lamps, each containing a combination of two replaceable light sources (other than those combinations specified in subparagraph (d) of this paragraph) shall be provided only as follows:
      (i) The lower beam shall be provided in one of the following ways:
         (A) By the outboard light source (or the uppermost if arranged vertically) designed to conform to the lower beam requirements of Figure 17–1 or Figure 17–2; or
         (B) By both light sources, designed to conform to the lower beam requirements of Figure 17–1 or Figure 17–2.
      (ii) The upper beam shall be provided in one of the following ways:
         (A) By the inboard light source (or the lower one if arranged vertically) designed to conform to the upper beam requirements of Figure 17–1 or Figure 17–2; or
         (B) By both light sources, designed to conform to the upper beam requirements of Figure 17–1 or Figure 17–2.
(3) The lower and upper beams of a headlamp system consisting of four lamps, using any combination of replaceable light sources except those specified in subparagraph (d) of this paragraph, each lamp containing only a single replaceable light source, shall be provided only as follows:
   (i) The lower beam shall be produced by the outboard lamp (or upper one if arranged vertically), designed to conform to the lower beam requirements of Figure 15–1 or Figure 15–2. The lens of each headlamp shall be permanently marked with the letter “L”.
   (ii) The upper beam shall be produced by the inboard lamp (or lower one of arranged vertically), designed to conform to the upper beam requirements of Figure 15–1 or Figure 15–2. The lens of each headlamp shall be permanently marked with the letter “U”.
   (f) Each lens reflector unit manufactured as replacement equipment shall be designed to conform to the requirements of subparagraphs (d) and (e) of this paragraph when any replaceable light source appropriate for such unit is inserted in it.
   (g) The lens of each replaceable bulb headlamp shall bear permanent marking in front of each replaceable light source with which it is equipped that states the HB Type, if the light source is designed to conform to subparas. (a) through (e) of paragraph S7.4 (c) through (h) of this standard.
   (h) The system shall be aimable in accordance with paragraph S7.8.
   (j) A replaceable bulb headlighting system may incorporate replaceable light sources that are used for purposes other than headlighting.

S7.6 Combination Headlighting System. A combination headlighting system shall be comprised of either two headlamps designed to conform to the requirements of S7.6.2, or any combination of four headlamps designed to conform to the requirements of S7.3.7, S7.4, or S7.5 of this standard.

S7.6.1 A combination headlighting system shall provide in total not more than two upper beams and two lower beams. When installed on a motor vehicle, the headlamps (or parts thereof) that provide the lower beam shall be of the same type, and provide a symmetrical effective projected luminous lens area when illuminated.

S7.6.2 In a combination headlighting system consisting of two headlamps, each headlamp shall be designed to conform to Figure 17–1 or Figure 17–2 and shall be a combination of two different headlamps chosen from the following types: a Type F headlamp, an integral beam headlamp, and a replaceable bulb headlamp.

S7.6.2.1 That part of the headlamp which contains an integral beam headlamp, or beam contributors used in place of a single headlamp, shall be designed to conform to the requirements of S7.4 (c) through (h) of this standard.

S7.6.2.2 That part of the headlamp which contains a replaceable bulb headlamp shall be designed to conform to the requirements of S7.5 of this standard.

S7.6.3 In a combination headlighting system consisting of four headlamps, each headlamp shall be designed to conform to Figure 15–1 or Figure 15–2, or if an integral beam headlamp in which there is more than one beam contributor, designed to conform to Figure 15–1 or Figure 15–2 in the manner required by S7.4(a)(3) of this standard.

S7.7 Replaceable light sources. Each replaceable light source shall be designed to conform to the dimensions and electrical specifications furnished with respect to it pursuant to part 564 of this chapter, and shall conform to the following requirements:
   (a) If other than an HB Type, the light source shall be marked with the bulb marking designation specified for it in compliance with Appendix A or Appendix B of part 564 of this chapter. The base of each HB Type shall be marked with its HB Type designation. Each replaceable light source shall also
be marked with the symbol DOT and with a name or trademark in accordance with paragraph S7.2.

(b) The measurement of maximum power and luminous flux that is submitted in compliance with Appendix A or Appendix B of part 564 of this chapter shall be made in accordance with this paragraph. The filament or discharge arc shall be seasoned before measurement of either. Measurement shall be made with the direct current test voltage regulated within one quarter of one percent. The test voltage shall be 12.8v. The measurement of luminous flux shall be in accordance with the Illuminating Engineering Society of North America, LM 45; IES Approved Method for Electrical and Photometric Measurements of General Service Incandescent Filament Lamps (April 1980). The filament of a replaceable light source shall be seasoned before such measurement. The white covers are used to eliminate the likelihood of incorrect lumen measurement that will occur should the reflectance of the light source base and electrical connector be low.

(1) For a light source with a resistive element type filament, seasoning of the light source shall be made in accordance with section 2.9 of SAE Standard J1383 APR85 Performance Requirements for Motor Vehicle Headlamps. The measurement of luminous flux shall be made with the black cap installed on Type HB1, Type HB2, Type HB4, and Type HB5 and on any other replaceable light source so designed; and shall be made with the electrical conductor and light source base shrouded with an opaque white colored cover, except for the portion normally located within the interior of the lamp housing. The measurement of luminous flux for Type HB3 and HB4 shall be made with the base covered with a white cover as shown in the drawings for Types HB3 and HB4 filed in Docket No. NHTSA 98–3397. (The white cover is used to eliminate the likelihood of incorrect lumen measurement that will occur should the reflectance of the light source base and electrical connector be low).

(c) The capsule, lead wires and/or terminals, and seal on each Type HB1, Type HB3, Type HB4, and Type HB5 light source, and on any other replaceable light source which uses a seal, shall be installed in a pressure chamber as shown in Figure 25 so as to provide an airtight seal. The diameter of the aperture in Figure 25 on a replaceable light source (other than an HB Type) shall be that dimension furnished for such light source in compliance with Appendix A or Appendix B of part 564 of this chapter. An airtight seal exists when no air bubbles appear on the low pressure (connector) side after the light source has been immersed in water for one minute while inserted in a cylindrical aperture specified for the light source, and subjected to an air pressure of 70kPa (10 P.S.I.G.) on the glass capsule side.

(d) The measurement of maximum power and luminous flux that is submitted in compliance with section VII of Appendix A of part 564 of this chapter, or section IV of Appendix B of part 564 of this chapter, shall be made with the direct current test voltage regulated within one quarter of one percent. The test voltage shall be 12.8v. The measurement of luminous flux shall be in accordance with the Illuminating Engineering Society of North America, LM 45; IES Approved Method for Electrical and Photometric Measurements of General Service Incandescent Filament Lamps (April 1980). The filament of a replaceable light source shall be seasoned before such measurement. The white covers are used to eliminate the likelihood of incorrect lumen measurement that will occur should the reflectance of the light source base and electrical connector be low.

(1) For a light source with a resistive element type filament, seasoning of the light source shall be made in accordance with section 2.9 of SAE Standard J1383 APR85 Performance Requirements for Motor Vehicle Headlamps. The measurement of luminous flux shall be made with the black cap installed on Type HB1, Type HB2, Type HB4, and Type HB5 light sources, and on any other replaceable light source so designed, and shall be made with the electrical conductor and light source base shrouded with an opaque white colored cover, except for the portion normally located within the interior of the lamp housing. The measurement of luminous flux for Type HB3 and Type HB4 shall be made with the base covered with the white cover shown in the drawings for Types HB3 and HB4 filed in Docket No. NHTSA 98–3397.

(2) For a light source using excited gas mixtures as a filament or discharge arc, seasoning of the light source system, including any ballast required for its operation, shall be made in accordance with section 4.0 of SAE Recommended Practice J2009 FEB93 Discharge Forward Lighting Systems. With the test voltage applied to the ballast input terminals, the measurement of
luminous flux shall be made with the black cap installed, if so designed, and shall be made with an opaque white colored cover, except for the portion normally located within the interior of the lamp housing.

(e) If a ballast is required for operation, each ballast shall bear the following permanent markings:
   (1) Name or logo of ballast manufacturer;
   (2) Ballast part number or unique identification;
   (3) Part number or other unique identification of the light source for which the ballast is designed;
   (4) Rated laboratory life of the light source/ballast combination, if the information for the light source has been filed in Appendix B of part 564 of this chapter;
   (5) A warning that ballast output voltage presents the potential for severe electrical shock that could lead to permanent injury or death;
   (6) Ballast output power in watts and output voltage in rms volts AC or DC; and
   (7) The symbol 'DOT'.

(f) For light sources that use excited gas mixtures as a filament or discharge arc, the “rated laboratory life” shall be determined in accordance with sections 4.3 and 4.9 of SAE Recommended Practice J2009 FEB93 Forward Discharge Lighting Systems.

(g) After the force deflection test conducted in accordance with S9, the permanent deflection of the glass envelope shall not exceed 0.13 mm in the direction of the applied force.

§ 571.108 Aimability Performance Requirements.

S7.8.1 (a) Each headlamp or beam contributor that is not visually/optically aimable in accordance with S7.8.5.3 of this standard shall be equipped with fiducial marks, aiming pads, or similar references of sufficient detail and accuracy, for determination of an appropriate vehicle plane to be used with the photometric procedures of SAE J1383 APR85 for correct alignment with the photometer axis when being tested for photometric compliance, and to serve for the aiming reference when the headlamp or beam contributor is installed on a motor vehicle. The fiducial marks, aiming pads, or similar references are protrusions, bubble vials, holes, indentations, ridges, scribed lines, or other readily identifiable marks established and described by the vehicle or headlamp manufacturer.

(b) Each motor vehicle manufactured on and after September 1, 1998, shall be equipped with headlamps or beam contributors which have a mark or markings that are visible from the front of the headlamp when installed on the vehicle to identify the optical axis of the headlamp to assure proper horizontal and vertical alignment of the aiming screen or optical aiming equipment. The manufacturer is free to choose the design of the mark or markings. The mark or markings may be on the interior or exterior of the lens or indicated by a mark or central structure on the interior or exterior of the headlamp.

(c) Each headlamp that is visually/optically aimable in accordance with S7.8.5.3 of this standard shall be marked in accordance with S7.8.5.3(f).

S7.8.2 Except as provided in this paragraph, each headlamp shall be installed on a motor vehicle with a mounting and aiming mechanism that allows aim inspection and adjustment of both vertical and horizontal aim, and is accessible for those purposes without removal of any vehicle parts, except for protective covers removable without the use of tools.

S7.8.2.1 (a) When installed on the vehicle, adjustment of one aim axis through its full on-vehicle range shall not cause the aim of the other axis to deviate more than ±0.76 degree.

(b) If the performance specified in paragraph (a) of this section is not achievable, the requirements of S7.8.5.2(b)(3) apply, except that if the aiming mechanism is not a VHAD, the requirements specific to VHADs are not applicable, and the instruction shall be specific to the aiming mechanism installed.

(c) A visually/optically aimable headlamp that has a lower beam shall not have a horizontal adjustment mechanism unless such mechanism meets the requirements of paragraph S7.8.5.2 of this standard.

S7.8.2.2 If the headlamp is aimed by moving the reflector relative to the
§ 571.108  49 CFR Ch. V (10–1–08 Edition)

lens and headlamp housing, or vice versa, it shall:

(a) Allow movement of the headlamp system, when tested in the laboratory, to be not less than the full range of pitch on the vehicle on which the headlamp system is installed and for the horizontal aim range limits of S7.8.4,

(b) Conform with the photometrics applicable to it with the lens at any position relative to the reflector within the range limits as specified in S7.8.2.2(a),

(c) Be exempted from the aim range limits for testing in a laboratory in S7.8.3, and

(d) Be exempted from S7.8.4 if it is visually/optically aimable and has fixed horizontal aim.

S7.8.3 When a headlamp system is tested in a laboratory, the range of its vertical aim shall not be less than ±4 degrees from the nominal correct aim position for the intended vehicle application. When installed on a motor vehicle, the range of vertical aim shall be not less than the full range of pitch of the vehicle on which the headlamp system is installed. The installed range of static pitch angle shall as a minimum be determined from unloaded vehicle weight to gross vehicle weight rating, and incorporate pitch angle effects from maximum trailer or trunk loadings, the full range of tire intermix sizes and suspensions recommended and/or installed by the vehicle manufacturer, and the anticipated effects of variable passenger loading. The vertical aim adjustment mechanism shall be continuously adjustable over the full range.

S7.8.4 When a headlamp system is tested in a laboratory, the range of its horizontal aim shall be not less that ±2.5 degrees from the nominal correct aim position for the intended vehicle application.

S7.8.5 When activated in a steady-burning state, headlamps shall not have any styling ornament or other feature, such as a translucent cover or grill, in front of the lens. Headlamp wipers may be used in front of the lens provided that the headlamp system is designed to conform with all applicable photometric requirements with the wiper stopped in any position in front of the lens. When a headlamp system is installed on a motor vehicle, it shall be aimable with at least one of the following: An externally applied aiming device, as specified in S7.8.5.1; an on-vehicle headlamp aiming device installed by the vehicle or lamp manufacturer, as specified in S7.8.5.2; or by visual/optical means, as specified in S7.8.5.3.

S7.8.5.1 External aiming. Each headlamp system that is capable of being mechanically aimed by externally applied headlamp aiming devices shall be mechanically aimable using the equipment specified in SAE Standard J602 OCT80 Headlamp Aiming Device for Mechanically Aimable Sealed Beam Headlamp Units without the removal of any ornamental trim rings, covers, wipers or other vehicle parts.

(a) The aim of the headlamps in each headlamp system, other than a headlamp system designed to conform to section S7.3, that is designed to use such external aiming devices, shall not deviate more than 0.30 degree when a downward torque of 20 lb.-in. (2.25 N-m) is removed from the headlamp in its design operating position. The downward force used to create the torque shall be applied parallel to the aiming reference plane, through the aiming pads, and displaced forward using a lever arm such that the force is applied on an axis that is perpendicular to the aiming reference plane and originates at the center of the aiming pad pattern (see Figures 4–1 and 4–3). For headlamps using the aiming pad locations of Group I, the distance between the point of application of force and the aiming reference plane shall be not less than 6.625 in. (168.3 mm) plus the distance from the aiming reference plane to the secondary plane, if used (see section S7.8.5.1(d)(1)). For headlamps using the nonadjustable Headlamp Aiming Device Locating Plates for the 146 mm diameter, the 176 mm diameter, and the 92 × 150 mm sealed beam units, the distance between the point of application of force and the aiming reference plane shall be not less than 6.609 in. (167.9 mm) plus the distance from the aiming reference plane to the secondary plane, if used. For headlamps using the nonadjustable Headlamp Aiming Device Locating Plates for the 146 mm diameter, the 176 mm diameter, and the 92 × 150 mm sealed beam units, the distance between the point of application of force and the aiming reference plane shall be not less than 6.625 in. (168.3 mm) plus the distance from the aiming reference plane to the secondary plane, if used.
§ 571.108

and the aiming plane shall, respectively, be not less than 6.984 in. (177.4 mm), 6.937 in. (176.2 mm), and 7.625 in. (193.7 mm). Each headlamp system that is designed to conform to paragraph S7.5 and that is designed to use such external aiming devices, and which is manufactured on or after September 1, 1990, shall comply with this paragraph.

(b) When a headlamp is installed on a motor vehicle, its aim in any direction shall not change by more than 0.30 degree nor shall the lamp recede more than 0.1 in. (2.5 mm) after being subjected to an inward force of 50 pounds (222 newtons) applied evenly to the lens parallel to the mechanical axis.

(c) Each headlamp system mounting and aiming mechanism shall be subjected to a salt spray (fog) test in accordance with ASTM B117–73 Method of Salt Spray (Fog) Testing for a period of 50 hours, consisting of two successive 25-hour periods of 24 hours exposure followed by 1 hour of drying. At the end of 50 hours, the headlamp system shall be capable of meeting any of the applicable requirements of paragraph S7.8.

(d) Each headlamp system which is designed to use the Headlamp Aiming Device Locating Plates with adjustable legs for the 100 × 165 mm unit and the 142 × 200 mm unit, and adjustable length legs, shall meet the requirements of subparagraphs (1) and (2) below.

(1) The lens shall have three aiming pads which meet the requirements of Figure 4, Dimensional Specifications for Location of Aiming Pads on Replaceable Bulb Headlamp Units. The aiming pads need not be centered at the geometric center of the lens, or on the optical axis. Except as provided in subparagraph (2), a whole number, which represents the distance in tenths of an inch (i.e. 0.3 inch=3) from the aiming reference plane to the respective aiming pad on the lens. The height of these numbers shall not be less than .157 inch (4 mm). If there is interference between the plane and the area of the lens between the aiming pads, the whole number represents the distance to a secondary plane. The secondary plane shall be located parallel to the aiming reference plane and as close to the lens as possible without causing interference.

(2) If the most forward aiming pad is the lower inboard aiming pad, then the dimensions may be placed anywhere on the lens. The dimension for the outboard aiming pad (Dimension F in Figure 4) shall be followed by the letter ‘‘H’’ and the dimension for the center aiming pad shall be followed by the letter ‘‘V.’’ The dimensions shall be expressed in tenths of an inch.

(e) Each headlamp may be designed to use the nonadjustable Headlamp Aiming Device Locating Plate for the 100×165 mm unit, the 142×200 mm unit, the 146 mm diameter unit, or the 178 mm diameter unit of SAE J602, or the 92×150 mm Type F unit, and incorporate lens-mounted aiming pads as specified for those units in Figures 10, 13, 5, or 7 respectively in SAE J1383 APR85, or Figure 11 of this standard for the Type F unit. If so designed, no additional lens marking is necessary to designate the type of plate or dimensions.

S7.8.5.2 On-vehicle aiming. Each headlamp system that is capable of being aimed by equipment installed on the vehicle shall include a Vehicle Headlamp Aiming Device (VHAD) that conforms to the following requirements:

(a) Aim. The VHAD shall provide for headlamp aim inspection and adjustment in both the vertical and horizontal axes.

(1) Vertical aim. The VHAD shall include the necessary references and scales relative to the horizontal plane to assure correct vertical aim for photometry and aiming purposes. An off-vehicle measurement of the angle of the plane of the ground is permitted. In addition, an equal number of graduations from the “O” position representing angular changes in the axis in the upward and downward directions shall be provided.

(i) Each graduation shall represent a change in the vertical position of the mechanical axis not larger than 0.19 degree (1 in. at 25 ft.) to provide for variations in aim at least 1.2 degrees above and below the horizontal, and have an accuracy relative to the zero mark of less than 0.1 degree.
(ii) The VHAD shall be marked to indicate headlamp aim movement in the upward and downward directions.

(iii) Each graduation shall indicate a linear movement of the scale indicator of not less than 0.05 in. (1.27 mm) if a direct reading analog indicator is used. If a remote reading indicator is provided, it shall represent the actual aim movement in a clear, understandable format.

(iv) The vertical indicator shall perform through a minimum range of ±1.2 degrees.

(v) Means shall be provided in the VHAD for compensating for deviations in floor slope less than 1.2 degrees from the horizontal that would affect the correct positioning of the headlamp for vertical aim.

(vi) The graduations shall be legible under an illumination level not greater than 30 foot candles, measured at the top of the graduation, by an observer having 20/20 vision (Snellen), and shall permit aim adjustment to within 0.19 degree (1 in. at 25 ft.).

(b) Aiming instructions.

(1) The instructions for properly aiming the headlighting system using the VHAD shall be provided on a label permanently affixed to the vehicle adjacent to the VHAD, or in the vehicle operator’s manual. The instructions shall advise that the headlighting system is properly aimed if the appropriate vertical plane (as defined by the vehicle manufacturer) is perpendicular to both the longitudinal axis of the vehicle, and a horizontal plane when the vehicle is on a horizontal surface, and the VHAD is set at “O” vertical and “O” horizontal.

(2) Should a remote indicator or a remote indicator and adjuster be provided, the instructions shall be placed in the operator’s manual, and may also be placed on a label adjacent to the VHAD.

(3) Should the mechanism not meet the requirements of S7.8.2.1, on each motor vehicle manufactured on or after September 1, 1990, a cautionary label shall be placed adjacent to the mechanism stating the caution and including either the reason for the caution or the corrective action necessary. Each such label shall also refer the reader to the vehicle operator’s manual for complete instructions. Each such vehicle shall be equipped with an operator’s manual containing the complete instructions appropriate for the mechanism installed.

(c) Each headlamp equipped with a VHAD that is manufactured for use on motor vehicles manufactured on or after September 1, 1998, shall be manufactured with its calibration permanently fixed by its manufacturer. Calibration in this case means the process of accurately aligning the geometry of the VHAD devices with the beam pattern for the purposes of compliance with the standard.
(d) **Testing the VHAD.** (1) The headlamp assembly (the headlamp(s), and the VHAD(s)) shall be mounted on a level goniometer, aligned to a photometer located not less than 60 ft. (18.3 m) from the VHAD assembly. The assembly shall be mechanically aimed using the VHAD in accordance with the manufacturer’s instructions as provided with the vehicle on which the VHAD is intended to be used. A $\frac{1}{4}$ degree reaim is permitted in any direction at any test point to allow for variations in readings between laboratories. The test shall be conducted in accordance with the procedures of paragraphs 4.1 and 4.1.4 of SAE J1383 APR85. Under these conditions the mounted headlamp assembly shall be designed to conform to the photometric requirements appropriate for the headlamp system under test.

(2) When tested in accordance with subsection (1) of this section, with any replacement headlamp unit(s) or light sources intended for use in the system under test, the VHAD and headlamp system shall be designed to conform to the photometric performance requirements appropriate for the system under test.

(3) The same VHAD and associated headlamp(s) (or headlamp assembly) shall be rigidly mounted in a headlamp test fixture and comply with the following laboratory test procedures:

(i) Each graduation on the horizontal and vertical aim scales shall be checked and any variation from the correct aim shall not exceed $\pm 0.2$ degree, and $\pm 0.1$ degree respectively.

(ii) With the aiming plane horizontal and vertical and with the scale on the device set at 0, the aimer shall be adjusted before each of the following tests to assure that the indicators are centered at 0.

(A) The VHAD and an unlighted headlamp assembly shall be stabilized at $20 \pm 5$ degrees F ($-7 \pm 3$ degrees C) in a circulating air environmental test chamber. After a period of 30 minutes, when measured at that soak temperature, the variation from correct horizontal and vertical aim shall not exceed $\pm 0.2$ degree, and $\pm 0.1$ degree, respectively.

(B) The VHAD and headlamp assembly with its highest wattage filament (or combination of filaments intended to be used simultaneously) energized at its design voltage, shall then be stabilized at $100 \pm 5$ degrees F ($38 \pm 3$ degrees C) in a circulating air environmental test chamber. After a period of 30 minutes, when measured at that soak temperature, the variation from correct horizontal and vertical aim shall not exceed $\pm 0.2$ degree, and $\pm 0.1$ degree, respectively.

(C) The VHAD and an unlighted headlamp assembly shall then be placed in a circulating air environmental test chamber and exposed to a temperature of $140 \pm 5$ degrees F ($60 \pm 3$ degrees C) for 24 hours, followed by a temperature of $-40 \pm 5$ degrees F ($-40 \pm 3$ degrees C) for 24 hours and then permitted to return to room temperature, after which the VHAD and headlamp assembly shall show no damage which would impair its ability to perform as specified herein. The variation from correct horizontal or vertical aim shall not exceed $\pm 0.2$ degree, and $\pm 0.1$ degree, respectively.

(D) The VHAD and headlamp assembly shall then be tested according to the corrosion test procedure of paragraph S7.8.5.1(c).

(E) The VHAD and headlamp assembly shall then be tested for photometric compliance as specified in paragraphs S7.8.5.2(c)(1) and (2).

S7.8.5.3 **Visual/optical aiming.** Each visually/optically aimable headlamp shall be designed to conform to the following requirements:

(a) **Vertical aim, lower beam.** Each lower beam headlamp shall have a cutoff in the beam pattern. It may be either on the left side or the right side of the optical axis, but once chosen for a particular headlamp system’s design, the side chosen for the cutoff shall not be changed for any headlamps intended to be used as replacements for those system’s headlamps.

(1) **Vertical position of cutoff.** The headlamp shall be aimed vertically so that the cutoff is on the left side, at 0.4 degree down from the H-H line, or on the right side, at the H-H line.

(2) **Vertical gradient.** The gradient of the cutoff measured at either 2.5 degrees L or 2.0 degrees R shall be not less than 0.13 based on the procedure of S7.8.5.3, paragraph (a)(5).
§ 571.108

(3) **Horizontal position of the cutoff.** The width shall be not less than two degrees, with not less than two degrees of its actual width centered at either 2.5 degrees L, or 2.0 degrees R.

(4) **Maximum inclination of cutoff.** The vertical location of the highest gradient at the ends of the minimum width shall be within ±0.2 degree of the vertical location of the maximum gradient measured at the appropriate vertical line (at either 2.5 degrees L for a left side cutoff, or 2.0 degrees R for a right side cutoff.)

(5) **Measuring the cutoff parameter.** (i) The headlamp shall be mounted on a fixture which simulates its actual design location on any vehicle for which the headlamp is intended. The fixture, with the headlamp installed shall be attached to the goniometer table in such a way that the fixture alignment axes are coincident with the goniometer axes. The headlamp shall be energized at the specified test voltage.

(ii) The headlamp beam pattern shall be aimed with the cutoff at the H-H axis. There shall be no adjustment, shimming, or modification of the horizontal axis of the headlamp or test fixture, unless the headlamp is equipped with a VHAD. In this case the VHAD shall be adjusted to zero.

(iii) A vertical scan of the beam pattern shall be conducted for a headlamp with a left side gradient by aligning the goniometer on a vertical line at 2.5 degrees L and scanning from 1.5 degrees U to 1.5 degrees D. For a headlamp with a right side gradient, a vertical scan of the beam pattern shall be conducted by aligning the goniometer on a vertical line at 2.0 degrees R and scanning from 1.5 degrees U to 1.5 degrees D.

(iv) Determine the maximum gradient within the range of the scan by using the formula: 

\[ G = \log E(a) - \log E(a + 0.1) \]

where “G” is the gradient, “E” is illumination and “\( a \)” is vertical angular position. The maximum value of the gradient “G” determines the vertical angular location of the cutoff. Perform vertical scans at 1.0 degree L and R of the measurement point of the maximum gradient to determine the inclination.

(b) **Horizontal aim, lower beam.** There shall be no adjustment of horizontal aim unless the headlamp is equipped with a horizontal VHAD. If the headlamp has a VHAD, it shall be set to zero.

(c) **Vertical aim, upper beam.** (1) If the upper beam is combined in a headlamp with a lower beam, the vertical aim of the upper beam shall not be changed from the aim set using the procedures of paragraphs 571.100(a) and (b) used for the lower beam.

(2) If the upper beam is not combined in a headlamp with a lower beam, the vertical aim of the upper beam shall be adjusted so that the maximum beam intensity is located on the H-H axis.

(d) **Horizontal aim, upper beam.** (1) If the upper beam is combined in a headlamp with a lower beam, the horizontal aim of the upper beam shall not be changed from the aim set using the procedures of paragraphs 571.100(a) and (b) used for the lower beam.

(2) If the upper beam is not combined in a headlamp with the lower beam and has fixed horizontal aim or has a horizontal VHAD, then the headlamp shall be mounted on a fixture which simulates its actual design location on any vehicle for which the headlamp is intended. The fixture, with the headlamp installed shall be attached to the goniometer table in such a way that the fixture alignment axes are coincident with the goniometer axes. The headlamp shall be energized at 12.8 ±0.20 mV. There shall be no adjustment, shimming, or modification of the horizontal axis of the headlamp or test fixture, unless the headlamp is equipped with a VHAD. In this case the VHAD shall be adjusted to zero.

(3) If the upper beam is not combined in a headlamp with a lower beam, and it does not have a VHAD, the horizontal aim of the upper beam shall be adjusted so that the maximum beam intensity is located on the V-V axis.

(e) **Photometric Requirements and Measurement.** (1) Instead of being designed to conform to the photometric requirements of Figures 15–1, 17–1, 27–1 or 28–1, a visually/optically aimable headlamp shall be designed to conform to the requirements of Figures 15–2, 17–2, 27–2 or 28–2 when tested in accordance with paragraph (2) and SAE J575.
(2) If the lower beam has a left side cutoff, reaim the headlamp vertically to place the maximum gradient found in paragraph S7.8.5.3 at 0.4 degrees below the H-H line. For an upper beam, the headlamp would already be aimed at the end of the procedure found in paragraph S7.8.5.3. A 0.25 degree reaim is permitted in any direction at any test point.

(f) Marking—(1) Headlamp optical axis mark. There shall be a mark or markings identifying the optical axis of the headlamp visible from the front of the headlamp when installed on the vehicle, to assure proper horizontal and vertical alignment of the aiming screen or optical aiming equipment with the headlamp being aimed. The manufacturer is free to choose the design of the mark or markings. The mark or markings may be on the interior or exterior of the lens or indicated by a mark or central structure on the interior or exterior of the headlamp.

(2) Visual/optical aimability identification marks. (i) The lens of a lower beam headlamp shall be marked “VOL” if the headlamp is intended to be visually/optically aimed using the left side of the lower beam pattern.

(ii) The lens of a lower beam headlamp shall be marked “VOR” if the headlamp is intended to be visually/optically aimed using the right side of the lower beam pattern.

(iii) The lens of each sealed beam or integral beam headlamp shall be marked “VOR” if the headlamp is of a type that was manufactured before May 1, 1997, and if such headlamp type has been redesigned since then to be visually/optically aimable.

(iv) The lens of a headlamp that is solely an upper beam headlamp and intended to be visually/optically aimed using the upper beam shall be marked “VO”.

(v) Each letter used in marking according to this paragraph shall be not less than 3 mm. high.

§571.108 Motorcycles. Each motorcycle shall be equipped with a headlighting system designed to conform to the following requirements.

S7.9.1 A motorcycle manufactured before September 1, 2000, may be equipped with—

(a) A headlighting system designed to conform to SAE Standard J584 Motorcycle Headlamps April 1964, or to SAE Standard J584 April 1964 with the photometric specifications of Figure 32 and the upper beam aimability specifications of paragraph S7.9.3; or

(b) One half of any headlighting system specified in S7.1 through S7.6 which provides both a full upper beam and full lower beam. Where more than one lamp must be used, the lamps shall be mounted vertically, with the lower beam as high as practicable.

S7.9.2 A motorcycle manufactured on or after September 1, 2000, shall be equipped with—

(a) A headlighting system designed to conform to SAE Standard J584 Motorcycle Headlamps April 1964 with the photometric specifications of Figure 32 and the upper beam aimability specifications of paragraph S7.9.3; or

(b) A headlighting system that conforms to S7.9.1(b).

S7.9.3 The upper beam of a multiple beam headlamp designed to conform to the photometric requirements of Figure 32 shall be aimed photoelectrically during the photometric test in the manner prescribed in SAE Standard J584 OCT93 Motorcycle Headlamps.

S7.9.4 Motorcycle headlamp modulation system.

S7.9.4.1 A headlamp on a motorcycle may be wired to modulate either the upper beam or the lower beam from its maximum intensity to a lesser intensity, provided that:

(a) The rate of modulation shall be 240 ± 40 cycles per minute.

(b) The headlamp shall be operated at maximum power for 50 to 70 percent of each cycle.

(c) The lowest intensity at any test point shall be not less than 17 percent of the maximum intensity measured at the same point.

(d) The modulator switch shall be wired in the power lead of the beam filament being modulated and not in the ground side of the circuit.

(e) Means shall be provided so that both the lower beam and upper beam
remain operable in the event of a modulator failure.

(f) The system shall include a sensor mounted with the axis of its sensing element perpendicular to a horizontal plane. Headlamp modulation shall cease whenever the level of light emitted by a tungsten filament light operating at 3000° Kelvin is either less than 270 lux (25 foot-candles) of direct light for upward pointing sensors or less than 60 lux (5.6 foot-candles) of reflected light for downward pointing sensors. The light is measured by a silicon cell type light meter that is located at the sensor and pointing in the same direction as the sensor. A Kodak Gray Card (Kodak R–27) is placed at ground level to simulate the road surface in testing downward pointing sensors.

(g) When tested in accordance with the test profile shown in Figure 9, the voltage drop across the modulator when the lamp is on at all test conditions for 12 volt systems and 6 volt systems shall not be greater than .45 volt. The modulator shall meet all the provisions of the standard after completion of the test profile shown in Figure 9.

(h) Means shall be provided so that both the lower and upper beam functions at design voltage when the headlamp control switch is in either the lower or upper beam position when the modulator is off.

S7.9.4.2(a) Each motorcycle headlamp modulator not intended as original equipment, or its container, shall be labeled with the maximum wattage, and the minimum wattage appropriate for its use. Additionally, each such modulator shall comply with S7.9.4.1 (a) through (g) when connected to a headlamp of the maximum rated power and a headlamp of the minimum rated power, and shall provide means so that the modulated beam functions at design voltage when the modulator is off.

(b) Instructions, with a diagram, shall be provided for mounting the light sensor including location on the motorcycle, distance above the road surface, and orientation with respect to the light.

S7.9.5 Each replaceable bulb headlamp that is designed to meet the photometric requirements of paragraph S7.9.1(a) or paragraph S7.9.2(a) and that is equipped with a light source other than a replaceable light source meeting the requirements of paragraph S7.7, shall have the word “motorcycle” permanently marked on the lens in characters not less than 0.114 in. (3 mm) in height.

S7.9.6 A headlamp system shall be installed on a motorcycle in accordance with the requirements of this paragraph.

S7.9.6.1 The headlamp system shall be located on the front of the motorcycle.

S7.9.6.2 (a) If the system consists of a single headlamp, it shall be mounted on the vertical centerline of the motorcycle. If the headlamp contains more than one light source, each light source shall be mounted on the vertical centerline with the upper beam no higher than the lower beam, or horizontally disposed about the vertical centerline and mounted at the same height. If the light sources are horizontally disposed about the vertical centerline, the distance between the closest edges of the effective projected luminous lens area in front of the light sources shall not be greater than 200 mm (8 in.).

(b) If the system consists of two headlamps, each of which provides both an upper and lower beam, the headlamps shall be mounted either at the same height and symmetrically disposed about the vertical centerline or mounted on the vertical centerline. If the headlamps are horizontally disposed about the vertical centerline, the distance between the closest edges of their effective projected luminous lens areas shall not be greater than 200 mm (8 in.).

(c) If the system consists of two headlamps, one of which provides an upper beam and one of which provides the lower beam, the headlamps shall be located on the vertical centerline with the upper beam no higher than the lower beam, or horizontally disposed about the vertical centerline and mounted at the same height. If the headlamps are horizontally disposed about the vertical centerline, the distance between the closest edges of their effective projected luminous lens areas shall not be greater than 200 mm (8 in.).
§ 571.108

Tests and Procedures for Integral Beam and Replaceable Bulb Headlighting Systems. When tested in accordance with the following procedures, each integral beam headlamp shall meet the requirements of paragraph S7.4, and each replaceable bulb headlamp shall meet the requirements of paragraph S7.5. Ballasts required to operate specific gas mixture light sources shall be included in the tests specified in paragraphs S8.1 and S8.4 through S8.7.

S8.1 Photometry. Each headlamp to which paragraph S8 applies shall be tested according to paragraphs 4.1 and 4.1.4 of SAE Standard J1383 APR85 for meeting the applicable photometric requirements, after each test specified in paragraphs S8.2, S8.3, S8.5, S8.6.1, S8.6.2, S8.7, and S8.10.1 and S8.10.2, if applicable. A ¼ degree reaim is permitted in any direction at any test point.

S8.2 Abrasion. (a) A headlamp shall be mounted in the abrasion test fixture in the manner indicated in Figure 5 with the lens facing upward.

(b) An abrading pad meeting the requirements in paragraphs (c)(1) through (c)(4) of this section shall be cycled back and forth (1 cycle) for 11 cycles at 4 ± 0.8 in. (10 cm ± 2 cm) per second over at least 80 percent of the lens surface, including all the area between the upper and lower aiming pads, but not including lens trim rings and edges.

(c)(1) The abrading pad shall be not less than 1.0 ± 0.04 in. (2.5 cm ± 0.1 cm) wide, constructed of 0000 steel wool, and rubber cemented to a rigid base shaped to the same vertical contour of the lens. The “grain” of the pad shall be perpendicular to the direction of motion.

(2) The abrading pad support shall be equal in size to the pad and the center of the support surface shall be within ±0.08 in. (±2 mm) of parallel to the lens surface.

(3) The density of the abrading pad shall be such that when the pad is mounted to its support and is resting unweighted on the lens, the base of the pad shall be no closer than .125 in. (3.2 mm) to the lens at its closest point.

(4) When mounted on its support and resting on the lens of the test headlamp, the abrading pad shall then be weighted such that a pad pressure of 2.0 ±.15 psi (14 ±1 KPa) exists at the center and perpendicular to the face of the lens.

(d) A pivot shall be used if it is required to follow the contour of the lens.

(e) Unused steel wool shall be used for each test.

S8.3 Chemical resistance. (a) The entire exterior lens surface of the headlamp in the headlamp test fixture and top surface of the lens-reflector joint shall be wiped once to the left and once to the right with a 6-inch square soft cotton cloth (with pressure equally applied) which has been saturated once in a container with 2 ounces of a test fluid as listed in paragraph (b). The lamp shall be wiped within 5 seconds after removal of the cloth from the test fluid.

(b) The test fluids are:

(1) ASTM Reference Fuel C, which is composed of Isooctane 50% volume and Toluene 50% volume. Isooctane must conform to A2.7 in Annex 2 of the Motor Fuels Section of the 1985 Annual Book of ASTM Standards, Vol. 05.04, and Toluene must conform to ASTM specification D362–84, Standard Specification for Industrial Grade Toluene. ASTM Reference Fuel C must be used as specified in:

(i) Paragraph A2.3.2 and A2.3.3 of Annex 2 to Motor Fuels, Section I in the 1985 Annual Book of ASTM Standards; and

(2) Tar remover (consisting by volume of 45% xylene and 55% petroleum base mineral spirits).

(3) Power steering fluid (as specified by the vehicle manufacturer for use in the motor vehicle on which the headlamp is intended to be installed).

(4) Windshield washer fluid consisting of 0.5% monoethanolamine with the remainder 50% concentration of methanol/distilled water by volume.

(5) Antifreeze (50% concentration of ethylene glycol/distilled water by volume).

(c) After the headlamp has been wiped with the test fluid, it shall be stored in its designed operating attitude for 48 hours at a temperature of 73
S8.4 Corrosion. (a) A connector test shall be performed on each filament circuit prior to the test in subparagraph (b) according to Figure 1 and SAE Standard J580 DEC86. The power source shall be set to provide 12.8 volts and the resistance shall be set to produce 10 amperes.

(b) The headlamp with connector attached to the terminals, unfixture and in its designed operating attitude with all drain holes, breathing devices or other designed openings in their normal operating positions, shall be subjected to a salt spray (fog) test in accordance with ASTM B117–73, Method of Salt Spray (Fog) Testing, for 240 hours, consisting of ten successive 24-hour periods. During each period, the headlamp shall be mounted in the middle of the chamber and exposed for 23 hours to the salt spray. The spray shall not be activated during the 24th hour. The bulb shall be removed from the headlamp and from the test chamber during the one hour of salt spray deactivation and reinserted for the start of the next test period, at the end of the first and last three 23-hour periods of salt spray exposure, and at the end of any two of the fourth through seventh 23-hour periods of salt-spray exposure. The test chamber shall be closed at all times except for a maximum of 2 minutes which is allowed for removal or replacement of a bulb during each period. After the ten periods, the lens reflector unit without the bulb shall be immersed in deionized water for 5 minutes, then secured and allowed to dry by natural convection only.

(c) Using the voltage, resistance and pretest set up of paragraph (a) the current in each filament circuit shall be measured after the test conducted in paragraph (b).

S8.5 Dust. The headlamp, mounted on a headlamp test fixture, with all drain holes, breathing devices or other designed openings in their normal operating positions, shall be positioned within a cubical box, with inside measurements of 35.4 in. (900 mm) on each side or larger if required for adequate wall clearance, i.e., a distance of at least 5.9 in. (150 mm) between the headlamp and any wall of the box. The box shall contain 9.9 lb. (4.5 kg) of fine powdered cement which conforms to the ASTM C150–77 specification for Portland Cement. Every 15 minutes, the cement shall be agitated by compressed air or fan blowers(b) by projecting blasts of air for a two-second period in a downward direction so that the cement is diffused as uniformly as possible throughout the entire box. This test shall be continued for five hours after which the exterior surfaces of the headlamp shall be wiped clean.

S8.6 Temperature and internal heat test. A headlamp with one or more replaceable light sources shall be tested according to paragraphs S8.6.1 and S8.6.2. Tests shall be made with all filaments lighted at design voltage that are intended to be used simultaneously in the headlamp and which in combination draw the highest total wattage. These include but are not limited to filaments used for turn signal lamps, fog lamps, parking lamps, and headlamp lower beams lighted with upper beams when the wiring harness is so connected on the vehicle. If a turn signal is included in the headlamp assembly, it shall be operated at 90 flashes a minute with a 75 ±2% current “on time.” If the lamp produces both the upper and lower beam, it shall be tested in both the upper beam mode and the lower beam mode under the conditions above described, except for a headlamp with a single Types HB1 or HB2 light source.

S8.6.1 Temperature cycle. A headlamp, mounted on a headlamp test fixture, shall be subjected to 10 complete consecutive cycles having the thermal cycle profile shown in Figure 6. During the hot cycle, the lamp, shall be energized commencing at point “A” of Figure 6 and de-energized at point “B.” Separate or single test chambers may be used to generate the environment of Figure 6. All drain holes, breathing devices or other openings or vents of the headlamps shall be in their normal operating positions.

S8.6.2 Internal Heat Test. (a) The headlamp lens surface that would normally be exposed to road dirt shall be
uniformly sprayed with any appropriate mixture of dust and water or other materials to reduce the photometric output at the H-V test point of the upper beam (or the \( \frac{3}{2} D-1\frac{1}{2} R \) test point of the lower beam as appropriate) to 25 ±2% of the output originally measured in the photometric test conducted pursuant to paragraphs S7.4(i), or S7.5 (a) through (e), as applicable. A headlamp with a single Types HB1 or HB2 light source shall be tested on the upper beam only. Such reduction shall be determined under the same conditions as that of the original photometric measurement.

(b) After the photometric output of the lamp has been reduced as specified in paragraph (a), the lamp and its mounting hardware shall be mounted in an environmental chamber in a manner similar to that indicated in Figure 7 “Dirt/Ambient Test Setup.” The headlamp shall be soaked for one hour at a temperature of 95 ±7 °F (35 ±4 °C) and then the lamp shall be energized according to paragraph S8.6 for one hour in a still air condition, allowing the temperature to rise from the soak temperature.

(c) The lamp shall be returned to a room ambient temperature of 73 ±7 °F (23 ±4 °C) and a relative humidity of 30 ±10% and allowed to stabilize to the room ambient temperature. The lens shall then be cleaned.

§ 571.108

S8.7 Humidity. (a) The test fixture consists of a horizontal steel plate to which three threaded steel or aluminum rods of \( \frac{1}{2} \) inch diameter are screwed vertically behind the headlamp. The headlamp assembly is clamped to the vertical rods, which are behind the headlamp. All attachments to the headlamp assembly are made behind the lens and vents or openings, and are not within 2 inches laterally of a vent inlet or outlet.

(b) The mounted headlamp assembly is oriented in its design operating position, and is placed in a controlled environment at a temperature of 100±7 °F (38±4 °C) with a relative humidity of not less than 90 percent. All drain holes, breathing devices, and other openings are in their normal operation positions for all phases of the humidity test. The headlamp shall be subjected to 24 consecutive 3-hour test cycles. In each cycle, it shall be energized for 1 hour at design voltage with the highest combination of filament wattages that are intended to be used, and then de-energized for 2 hours. If the headlamp incorporates a turn signal, it shall flash at 90 flashes per minute with a 75±2 percent "on-time."

(c) Within 3 minutes after the completion of the 24th cycle, the air flow test will begin. The following shall occur: the mounted assembly shall be removed, placed in an insulating box and covered with foam material so that there is no visible air space around the assembly; the box shall be closed, taken to the air flow test chamber, and placed within it. Inside the chamber, the assembly with respect to the air flow, shall be oriented in its design operating position. The assembly is positioned in the chamber so that the center of the lens is in the center of the opening of the air flow entry duct during the test. The headlamp has at least 3 inches clearance on all sides, and at least 4 inches to the entry and exit ducts at the closest points. If vent tubes are used which extend below the lamp body, the 3 inches are measured from the bottom of the vent tube or its protection. The temperature of the chamber is 73±7 °F (23±4 °C) with a relative humidity of 30±10 percent. The headlamp is not energized.

(d) Before the test specified in paragraph (e) of this section, the uniformity of the air flow in the empty test chamber at a plane 4 inches downstream of the air entry duct shall have been measured over a 4-inch square grid. The uniformity of air flow at each grid point is ±10 percent of the average air flow specified in paragraph (e) of this section.

(e) The mounted assembly in the chamber shall be exposed, for one hour, to an average air flow of 330±0–30 ft/min, as measured with an air velocity measuring probe having an accuracy of ±3 percent in the 330 ft/min range. The average air flow is the average of the velocity recorded at six points around the perimeter of the lens. The six points are determined as follows: At
§571.108  49 CFR Ch. V (10–1–08 Edition)

the center of the lens, construct a horizontal plane. The first two points are located in the plane, 1 inch outward from the intersection of the plane and each edge of the lens. Then, trisect the distance between these two points and construct longitudinal vertical planes at the two intermediate locations formed by the trisection. The four remaining points are located in the vertical planes, one inch above the top edge of the lens, and one inch below the bottom edge of the lens.

(5) After one hour, the headlamp is removed and inspected for moisture.

S8.8 Vibration. A vibration test shall be conducted in accordance with the procedures of SAE Standard J575e Tests for Motor Vehicle Lighting Devices and Components August 1970, and the following: the table on the adapter plate shall be of sufficient size to completely contain the test fixture base with no overhang. The vibration shall be applied in the vertical axis of the headlamp system as mounted on the vehicle. The filament shall not be energized.

S8.9 Sealing. An unfixture headlamp in its design mounting position shall be placed in water at a temperature of 176 ±5 degrees F (80 ±3 degrees C) for one hour. The headlamp shall be energized in its highest wattage mode, with the test voltage at 12.8 ±0.1 V, during immersion. The lamp shall then be de-energized and immediately submerged in its design mounting position into water at 32 ±5 – 0 degrees F (0 ±3 – 0 degrees C). The water shall be in a pressurized vessel, and the pressure shall be increased to 10 psi (70 kPa), upon placing the lamp in the water. The lamp shall remain in the pressurized vessel for a period of thirty minutes. This entire procedure shall be repeated for four cycles. Then the lamp shall be inspected for any signs of water on its interior. During the high temperature portion of the cycles, the lamp shall be observed for signs of air escaping from its interior. If any water occurs on the interior or air escapes, the lamp is not a sealed lamp.

S8.10 Chemical and corrosion resistance of reflectors of replaceable lens headlamps.

S8.10.1 Chemical resistance. (a) With the headlamp in the headlamp test fixture and the lens removed, the entire surface of the reflector that receives light from a headlamp light source shall be wiped once to the left and once to the right with a 6-inch square soft cotton cloth (with pressure equally applied) which has been saturated once in a container with 2 ounces of one of the test fluids listed in paragraph (b). The lamp shall be wiped within 5 seconds after removal of the cloth from the test fluid.

(b) The test fluids are:

(1) Tar remover (consisting by volume of 45% xylene and 55% petroleum base mineral spirits);

(2) Mineral spirits; or

(3) Fluids other than water contained in the manufacturer’s instructions for cleaning the reflector.

(c) After the headlamp has been wiped with the test fluid, it shall be stored in its designed operating attitude for 48 hours at a temperature of 73 °F ±7° (23 °C ±4°) and a relative humidity of 30 ±10 percent. At the end of the 48-hour period, the headlamp shall be wiped clean with a soft dry cotton cloth and visually inspected.

S8.10.2 Corrosion. (a) The headlamp with the lens removed, unfixture and in its designed operating attitude with all drain holes, breathing devices or other designed openings in their normal operating positions, shall be subjected to a salt spray (fog) test in accordance with ASTM B117–73, Method of Salt Spray (Fog) Testing, for 24 hours, while mounted in the middle of the chamber.

(b) Afterwards, the headlamp shall be stored in its designed operating attitude for 48 hours at a temperature of 73 °F ±7° (23 °C ±4°) and a relative humidity of 30 ±10 percent and allowed to dry by natural convection only. At the end of the 48-hour period, the reflector shall be cleaned according to the instructions supplied with the headlamp manufacturer’s replacement lens, and inspected. The lens and seal shall then be attached according to these instructions and the headlamp tested for photometric performance.

S9. Deflection test for replaceable light sources. With the light source rigidly mounted in a fixture in a manner indicated in Figure 8, a force 4.0 ±0.1
pounds (17.8 ± 0.4N) is applied at a distance “A” from the reference plane perpendicular to the longitudinal axis of the glass capsule and parallel to the smallest dimension of the pressed glass capsule seal. The force shall be applied (using a rod with a hard rubber tip with a minimum spherical radius of .039 in (1 mm)) radially to the surface of the glass capsule in four locations in a plane parallel to the reference plane and spaced at a distance “A” from that plane. These force applications shall be spaced 90 degrees apart starting at the point perpendicular to the smallest dimension of the pressed seal of the glass capsule. The bulb deflection shall be measured at the glass capsule surface at 180 degrees opposite to the force application. Distance “A” for a replaceable light source other than an HB Type shall be the dimension provided in accordance with Appendix A of part 564 of this chapter, section I.A.1 if the light source has a lower beam filament, or as specified in section I.B.1 if the light source has only an upper beam filament.

S10 Simultaneous Aim Photometry Tests—(a) Type F Headlamp Systems. The assembly shall be located on a goniometer placed not less than 60 feet (18.3m) from the photometer. The LF unit shall be aimed mechanically by centering the unit on the photometer axis and by aligning the aiming plane of the lens perpendicular to the photometer axis. Then the assembly shall be moved in a plane parallel to the established aiming plane of the LF headlamp until the UF headlamp is centered on the photometer axis. Photometric compliance of the lower beam shall be determined with all lower beam contributors illuminated and in accordance with sections 4.1 and 4.1.6 of SAE Standard J1383 APR85, and Figure 15-1 or Figure 15-2. The assembly shall then be moved in a plane parallel to the established aiming plane of the lower beam until the assembly is located with the geometric center of the upper lens(es) on the photometer axis. Photometric compliance for upper beam shall now be determined using the figure and procedure specified for the lower beam. During photometric testing, a ½ degree reaim is permitted in any direction at any test point.

S11. Photometric Test. A lamp that is wired in accordance with paragraph S5.5.11 of this standard, shall be tested for compliance with S5.5.11(a)(1) in accordance with the test method specified for photometric testing in SAE Standard J575 DEC88 when a test voltage of 12.8V ±20 mV is applied to the input terminals of the lamp switch module or voltage-reducing equipment, whichever is closer to the electrical source on the vehicle. The test distance from the lamp to the photometer shall be not less than 18.3 m, if the lamp is optically combined with a headlamp, or is a separate lamp, and not less than 3 m, if the lamp is optically combined with a lamp, other than a headlamp, that is required by this standard.

S12.1 While the headlamp is illuminated, its fully opened headlamp concealment device shall remain fully opened should any loss of power to or within the headlamp concealment device occur.

S12.2 Whenever any malfunction occurs in a component that controls or conducts power for the actuation of the concealment device, each closed headlamp concealment device shall be capable of being fully opened by a means not requiring the use of any tools. Thereafter, the headlamp concealment device must remain fully opened until intentionally closed.
§ 571.108

S12.3 Except for malfunctions covered by S12.2, each headlamp concealment device shall be capable of being fully opened and the headlamps illuminated by actuation of a single switch, lever, or similar mechanism, including a mechanism that is automatically actuated by a change in ambient light conditions.

S12.4 Each headlamp concealment device shall be installed so that the headlamp may be mounted, aimed, and adjusted without removing any component of the device, other than components of the headlamp assembly.

S12.5 Except for cases of malfunction covered by S12.2, each headlamp concealment device shall, within an ambient temperature range of $-20 \, ^\circ F.$ to $+120 \, ^\circ F.$, be capable of being fully opened in not more than 3 seconds after the actuation of a driver-operated control.

S12.7 Manufacturers of vehicles with headlamps incorporating VHAD or visual/optical aiming shall elect to certify to S12.1 through S12.5 or to S12.6 prior to, or at the time of certification of the vehicle, pursuant to 49 CFR part 567. The selection is irrevocable.

</tbody>
</table>

1 Maximum at H or above.
The maximum candlepower value of 125 applies to all test points at H or above. The maximum allowable candlepower value below H is 250.

Values apply when the optical axis (filament center) of the front turn signal is at a spacing less than 4 in. (10 cm.) from the lighted edge of the headlamp unit providing the lower beam, or from the lighted edge of any additional lamp installed as original equipment and which supplements the lower beam.

1 When 2 lamps of the same or symmetrically opposite design are used, the reading along the vertical axis and the averages of the readings for the same angles left and right of vertical for 1 lamp shall be used to determine compliance with the requirements. If 2 lamps of differing designs are used, they shall be tested individually and the values added to determine that the combined units meet twice the candela requirements.

When only 1 backup lamp is used on the vehicle, it shall be tested to twice the candela requirements.

NOTE: (1) The term "overall width" refers to the nominal design dimension of the widest part of the vehicle, exclusive of signal lamps, marker lamps, outside rearview mirrors, flexible fender extensions, and mud flaps, determine with doors and windows closed, and the wheels in the straight-ahead position.

(2) Paragraph S3.1 and Tables I and III of §571.108 as amended (32 FR 18033, Dec. 16, 1967), specify that certain lamp assemblies shall conform to applicable SAE Standards. Each of these basically referenced standards subreferences both SAE Standard J575 (tests for motor vehicle lighting devices and components) which in turn references SAE Standard J573 on bulbs, and SAE Standard J567 on bulb sockets.

(3) Paragraph C of SAE Standard J575 states in part: "Where special bulbs are specified, they should be submitted with the devices and the same or similar bulbs used in the tests and operated at their rated mean spherical candlepower." The Administrator has determined that this provision of SAE Standard J575 permits the use of special bulbs, including tubular-type bulbs, which do not conform to the detailed requirements of Table I of SAE Standard J573. It follows that the sockets for special bulbs need not conform to the detailed requirements of Federal Standard No. 108, including those specified in the basically referenced SAE Standards, and in the subreferenced SAE Standard J575.

[41 FR 35522, Aug. 23, 1976]

EDITORIAL NOTE: For Federal Register citations affecting §571.108, see the List of CFR Sections Affected, which appears in the Finding Aids section of the printed volume and on GPO Access.
§ 571.108 Standard No. 108; Lamps, reflective devices, and associated equipment.

EFFECTIVE DATE NOTE: At 72 FR 68269, Dec. 4, 2007, § 571.108 was revised, effective Sept. 1, 2008. At 73 FR 50730, Aug. 28, 2008, the revision of § 571.108 was delayed until Dec. 1, 2009. For the convenience of the user, the revised text is set forth as follows:

§ 571.108 Standard No. 108; Lamps, reflective devices, and associated equipment.

S1 Scope. This standard specifies requirements for original and replacement lamps, reflective devices, and associated equipment.

S2 Purpose. The purpose of this standard is to reduce traffic accidents and deaths and injuries resulting from traffic accidents, by providing adequate illumination of the roadway, and by enhancing the conspicuity of motor vehicles on the public roads so that their presence is perceived and their signals understood, both in daylight and in darkness or other conditions of reduced visibility.

S3 Application. This standard applies to:

S3.1 Passenger cars, multipurpose passenger vehicles, trucks, buses, trailers (except pole trailers and trailer converter dollies), and motorcycles;

S3.2 Retroreflective sheeting and reflex reflectors manufactured to conform to S8.2 of this standard; and

S3.3 Lamps, reflective devices, and associated equipment for replacement of like equipment on vehicles to which this standard applies.

S4 Definitions.

Aiming plane means a plane defined by the surface of the three aiming pads on the lens.

Aiming reference plane means a plane which is perpendicular to the longitudinal axis of the vehicle and tangent to the forwardmost aiming pad on the headlamp.

Aiming screws are the horizontal and vertical adjusting screws with self-locking features used to aim and retain a headlamp unit in the proper position.

Axis of reference means the characteristic axis of the lamp for use as the direction of reference (H = 0°, V = 0°) for angles of field for photometric measurements and for installing the lamp on the vehicle.

Backup lamp means a lamp or lamps which illuminate the road to the rear of a vehicle and provide a warning signal to pedestrians and other drivers when the vehicle is backing up or is about to back up.

Beam contributor means an indivisible optical assembly including a lens, reflector, and light source, that is part of an integral beam headlighting system and contributes only a portion of a headlamp beam.

Cargo lamp is a lamp that is mounted on a multipurpose passenger vehicle, truck, or bus for the purpose of providing illumination to load or unload cargo.

Clearance lamps are lamps which show to the front or rear of the vehicle, mounted on the permanent structure of the vehicle as near as practicable to the upper left and right extreme edges to indicate the overall width and height of the vehicle.

Coated materials means a material which has a coating applied to the surface of the finished sample to impart some protective properties. Coating identification means a mark of the manufacturer’s name, formulation designation number, and recommendations for application.

Color Fundamental definitions of color are expressed by Chromaticity Coordinates according to the International Commission on Illumination (C.I.E.) 1931 Standard Colorimetric System, as described in the CIE 1931 Chromaticity Diagram (incorporated by reference, see § 571.108 § 55.2 of this title).

Color bleeding means the migration of color out of a plastic part onto the surrounding surface.

Combination clearance and side marker lamps are single lamps which simultaneously fulfill the requirements of clearance and side marker lamps.

Crazing means a network of apparent fine cracks on or beneath the surface of materials.

Cracking means a generally horizontal, visual/optical aiming cue in the lower beam that marks a separation between areas of higher and lower luminance.

Daytime running lamps (DRLs) are steady burning lamps that are used to improve the conspicuity of a vehicle from the front and front sides when the regular headlamps are not required for driving.

Delamination means a separation of the layers of a material including coatings.

Design voltage means the voltage used for design purposes.

Direct reading indicator means a device that is mounted in its entirety on a headlamp or headlamp aiming or headlamp mounting equipment, is part of a VHAD, and provides information about headlamp aim in an analog or digital format.

Effective light-emitting surface means that portion of a lamp that directs light to the photometric test pattern, and does not include transparent lenses, mounting hole bosses, reflex reflector area, beads or rims that may glow or produce small areas of increased intensity as a result of uncontrolled light from an area of 15° radius around a test point.

Effective projected luminous lens area means the area of the orthogonal projection of the effective light-emitting surface of a lamp on a plane perpendicular to a defined direction relative to the axis of reference. Unless otherwise specified, the direction is coincident with the axis of reference.

Exposed means material used in lenses or optical devices exposed to direct sunlight as installed on the vehicle.

49 CFR Ch. V (10–1–08 Edition)
Filament means that part of the light source or light-emitting element(s), such as a resistive element, the excited portion of a specific mixture of gases under pressure, or any other energy conversion sources, that generates radiant energy which can be seen.

Flash means a cycle of activation and deactivation of a lamp by automatic means continuing until stopped either automatically or manually.

Fully opened means the position of the headlamp concealment device in which the headlamp is in the design open operating position.

H-V axis means the line from the center of the principal filament of a lamp to the intersection of the horizontal (H) and vertical (V) lines of a photometric test screen.

Haze means the cloudy or turbid appearance of an otherwise transparent specimen caused by light scattered from within the specimen or from its surface.

Headlamp means a lighting device providing an upper and/or a lower beam used for providing illumination forward of the vehicle.

Headlamp concealment device means a device, with its operating system and components, that provides concealment of the headlamp when it is not in use, including a movable headlamp cover and a headlamp that displaces for concealment purposes.

Headlamp mechanical axis means the line formed by the intersection of a horizontal and a vertical plane through the light source parallel to the longitudinal axis of the vehicle. If the mechanical axis of the headlamp is not at the geometric center of the lens, then the location will be indicated by the manufacturer on the headlamp.

Headlamp test fixture means a device designed to support a headlamp or headlamp assembly in the test position specified in the laboratory tests and whose mounting hardware and components are those necessary to operate the headlamp as installed in a motor vehicle.

High-mounted stop lamp means a lamp mounted high and possibly forward of the tail, stop, and rear turn signal lamps intended to give a steady stop warning through intervening vehicles to operators of following vehicles.

Identification lamps are lamps used in groups of three, in a horizontal row, which show to the front or rear or both, having lamp centers spaced not less than (6 in) 15.2 mm nor more than (12 in) 30.4 mm apart, mounted on the permanent structure as near as practicable to the vertical centerline and the top of the vehicle to identify certain types of vehicles.

Integral beam headlamp means a headlamp other than a standardized sealed beam headlamp designed to conform to paragraph S10.15 or a replaceable bulb headlamp designed to conform to paragraph S10.15 comprising an integral and indivisible optical assembly including lens, reflector, and light source, except that a headlamp conforming to paragraph S10.18.8 or paragraph S10.18.9 may have a lens designed to be replaceable.

License plate lamp means a lamp used to illuminate the license plate on the rear of a vehicle.

Lower beam means a beam intended to illuminate the road and its environs ahead of the vehicle when meeting or closely following another vehicle.

Material means the type and grade of plastics, composition, and manufacturer’s designation number and color.

Mechanically adjustable headlamp means a headlamp having three pads on the lens, forming an aiming plane used for laboratory photometric testing and for adjusting and inspecting the aim of the headlamp when installed on the vehicle.

Motor driven cycle means every motorcyle, including every motor scooter, with a motor which produces not more than 5 horsepower, and every bicycle with motor attached.

Motorcycle or motor driven cycle headlamp means a major lighting device used to produce general illumination ahead of the vehicle.

Mounting ring means the adjustable ring upon which a sealed beam unit is mounted.

Mounting ring (type F sealed beam) means the adjustable ring upon which a sealed beam unit is mounted and which forces the sealed beam unit to seat against the aiming ring when assembled into a sealed beam assembly.

Multiple compartment lamp means a device which gives its indication by two or more separately lighted areas which are joined by one or more common parts, such as a housing or lens.

Multiple lamp arrangement means an array of two or more separate lamps on each side of the vehicle which operate together to give a signal.

Optically combined means a lamp having a single or two filament light source or two or more separate light sources that operate in different ways, and has its optically functional lens area wholly or partially common to two or more lamp functions.

Overall width means the nominal design dimension of the widest part of the vehicle, exclusive of signal lamps, marker lamps, outside rearview mirrors, flexible fender extensions, mud flaps, and outside door handles determined with doors and windows closed, and the wheels in the straight-ahead position. Running boards may also be excluded from the determination of overall width if they do not extend beyond the width as determined by the other items excluded by this definition.

Parking lamps are lamps on both the left and right of the vehicle which show to the
front and are intended to mark the vehicle when parked or serve as a reserve front position indicating system in the event of headlamp failure.

Refractive lenses are material used in inner lenses for optical devices where such lenses are protected from exposure to the sun by an outer lens made of materials meeting the requirements for exposed plastics.

Rated voltage means the nominal circuit or vehicle electrical system voltage classification.

Reflex reflectors are devices used on vehicles to give an indication to approaching drivers using reflected light from the lamps of the approaching vehicle.

Remote reading indicator means a device that is not mounted in its entirety on a headlamp or headlamp aiming or headlamp mounting equipment, but otherwise meets the definition of a direct reading indicator.

Replaceable bulb headlamp means a headlamp comprising a bonded lens and reflector assembly and one or two replaceable light sources, except that a headlamp conforming to paragraph S10.18.8 or paragraph S10.18.9 may have a lens designed to be replaceable.

Replaceable light source means an assembly of a capsule, base, and terminals that is designed to conform to the requirements of appendix A or appendix B of 49 CFR part 564 Replaceable Light Source Information of this Chapter.

Retaining ring means the clamping ring that holds a sealed beam unit against a mounting ring.

Retaining ring (type F sealed beam) means the clamping ring that holds a sealed beam unit against a mounting ring, and that provides an interface between the unit’s aiming/seating pads and the headlamp aimer adapter (locating plate).

School bus signal lamps are alternately flashing lamps mounted horizontally both front and rear, intended to identify a vehicle as a school bus and to inform other users of the highway that such vehicle is stopped on the highway to take on or discharge school children.

Sealed beam headlamp means an integral and indivisible optical assembly including the light source with “SEAL BEAM” molded in the lens.

Sealed beam headlamp assembly means a major lighting assembly which includes one or more sealed beam units used to provide general illumination ahead of the vehicle.

Seasoning means the process of energizing the filament of a headlamp at design voltage for a period of time equal to 1% of design life, or other equivalent method.

Semiautomatic headlamp beam switching device is one which provides either automatic or manual control of beam switching at the option of the driver. When the control is automatic the headlamps switch from the upper beam to the lower beam when illuminated by the headlamps on an approaching vehicle and switch back to the upper beam when the road ahead is dark. When the control is manual, the driver may obtain either beam manually regardless of the conditions ahead of the vehicle.

Side marker lamps are lamps which show to the side of the vehicle, mounted on the permanent structure of the vehicle as near as practicable to the front and rear edges to indicate the overall length of the vehicle. Additional lamps may also be mounted at intermediate locations on the sides of the vehicle.

Stop lamps are lamps giving a steady light to the rear of a vehicle to indicate a vehicle is stopping or diminishing speed by braking. Taillamps are steady burning low intensity lamps used to designate the rear of a vehicle.

Test voltage means the specified voltage and tolerance to be used when conducting a test.

Turn signal lamps are the signaling element of a turn signal system which indicates the intention to turn or change direction by giving a flashing light on the side toward which the turn will be made.

Turn signal flasher means a device which causes a turn signal lamp to flash as long as it is turned on.

Turn signal operating unit means an operating unit that is part of a turn signal system by which the operator of a vehicle causes the signal units to function.

Upper beam means a beam intended primarily for distance illumination and for use when not meeting or closely following other vehicles.

Vehicle headlamp aiming device or VHAD means motor vehicle equipment, installed either on a vehicle or headlamp, which is used for determining the horizontal or vertical aim, or both the vertical and horizontal aim of the headlamp.

Vehicular hazard warning signal flasher means a device which, as long as it is turned on, causes all the required turn signal lamps to flash.

Vehicular hazard warning signal operating unit means a driver controlled device which causes all required turn signal lamps to flash simultaneously to indicate to approaching drivers the presence of a vehicular hazard.

Visually/optically aimable headlamp means a headlamp which is designed to be visually/optically aimable in accordance with the requirements of paragraphs S10.18.9 of this standard.

§ 571.108, Nt.

References to SAE publications.

S5.1 Each required lamp, reflective device, and item of associated equipment must be designed to conform to the requirements of applicable SAE publications as referenced and subreferenced in this standard. The words “it is recommended that,” “recommendations,” or “should be” appearing in
§ 571.108, NI.

any SAE publication referenced or subreferenced in this standard must be read as setting forth mandatory requirements.

S6.1.1 Quantity, Except as provided in succeeding paragraphs of this S6.1.1 each vehicle must be equipped with at least the number of lamps, reflective devices, and items of associated equipment specified for that vehicle.
§ 571.108, N1.  

49 CFR Ch. V (10–1–08 Edition)

type and size in Table I and Section 6.6, designed to conform to the requirements of this standard. Multiple license plate lamps and backup lamps may be used to fulfill photometric requirements.

S6.1.1.1 Conspicuity systems. Each trailer of 2322 mm or more in overall width, and with a GVWR over 10,000 lbs., except a trailer designed exclusively for living or office use, and each truck tractor must be equipped with retroreflective sheeting, reflex reflectors, or a combination of retroreflective sheeting and reflex reflectors as specified in S8.2.

S6.1.1.2 High-mounted stop lamps. Each multipurpose passenger vehicle, truck, and bus required by this standard to be equipped with a high-mounted stop lamp, whose vertical centerline, when the vehicle is viewed from the rear, is not located on a fixed body panel but separates one or two moveable body sections, such as doors, which lacks sufficient space to install a single high-mounted stop lamp on the centerline above such body sections, must have two high-mounted stop lamps identical in size and shape.

S6.1.1.3 The two lamps must be located at the same height, with one vertical edge of each lamp on the vertical edge of the body section nearest the vehicle centerline.

S6.1.1.3.1 Truck tractor rear turn signal lamps. A truck tractor need not be equipped with turn signal lamps mounted on the rear if the turn signal lamps installed at or near the front are of double face construction and are located such that they meet the photometric requirements for double face turned signal lamps specified in Footnote 6 of Table VII.

S6.1.1.3.2 When multiple lamp arrangements or multiple compartment rear turn signal lamps, stop lamps, or taillamps are used, with only a portion of the compartments or lamps installed on a rigid part of the vehicle, that portion must meet at least the photometric requirements for the applicable single compartment lamp.

S6.1.1.3.3 License plate lamp. The license plate lamp or lamps installed on vehicles other than motorcycles and motor driven bicycles must be mounted so as to illuminate the license plate without obstruction from any designed feature unless the lamp or lamps is (are) designed to comply with all the photometric requirements with these obstructions considered.

S6.1.1.3.4 High-mounted stop lamps.

S6.1.3.5.1 Vertical headlamp arrangement.

S6.1.3.5.1.1 Where multiple headlamps with single light sources are installed in a vertical orientation the lower beam must be provided by the uppermost headlamp.

S6.1.3.5.1.2 Where headlamps with two vertically oriented light sources are installed the lower beam must be provided by the uppermost light source or by all light sources.

S6.1.3.5.1.3 Where more than one lamp must be used for a motorcycle headlighting system, the lamps must be mounted vertically, with the lower beam as high as practicable.

S6.1.3.5.2 Horizontal headlamp arrangement.

S6.1.3.5.2.1 Where multiple headlamps with single light sources are installed in a horizontal orientation the lower beam must be provided by the most outboard headlamp.

S6.1.3.5.2.2 Where headlamps with two horizontally oriented light sources are installed the lower beam must be provided by the outboard light source or by all light sources.

S6.1.3.6 Auxiliary lamps mounted near identification lamps. Each auxiliary lamp must be located at least twice the distance from any required identification lamp as the distance between two adjacent required identification lamps.

S6.1.4 Mounting height. The mounting height of each lamp and reflective device
must be measured from the center of the item, as mounted on the vehicle at curb weight, to the road surface.

S6.1.4.1 **High-mounted stop lamps.**
The high-mounted stop lamp mounted below the rear window must have no lens portion lower than 153 mm [6 in] below the lower edge of the rear glazing on convertibles, or 77 mm [3 in] on other passenger cars.

S6.1.5 **Activation.** Each lamp must be activated as specified, in the combinations specified, and in response to the inputs specified in Table I and Table II.

S6.1.5.1 **Hazard warning signal.** In all passenger cars, multipurpose passenger vehicles, trucks, and buses, the activation of the vehicular hazard warning signal operating unit must cause to flash simultaneously sufficient turn signal lamps to meet, as a minimum, the turn signal photometric requirements of this standard.

S6.1.5.2 **Simultaneous beam activation.**
S6.1.5.2.1 On any vehicle to which this standard applies where the headlighting system is designed to conform to the photometric requirements of UB1 of Table XVIII and LB3M or LB4V of Table XIX-a, the lamps marked “U” or “UF” may remain permanently activated when the lamps marked “U” or “UF” are activated.

S6.1.5.2.2 On any vehicle to which this standard applies where an integral beam headlighting system is designed to conform to the photometric requirements of UB6 of Table XVIII and LB6M of Table XIX-b or LB4V of Table XIX-c, the lower beam headlamps must remain permanently activated when the upper beam headlamps are activated.

S6.1.5.2.3 On any vehicle to which this section applies where the headlighting system is designed to conform to the photometric requirements of UB2 of Table XVIII and LB2M or LB2V of Table XIX-a, a lower beam light source may remain permanently activated when an upper beam light source is activated if the lower beam light source contributes to the upper beam photometric compliance of the headlighting system.

S6.2 **Impairment.**
S6.2.1 No additional lamp, reflective device, or other motor vehicle equipment is permitted to be installed that impairs the effectiveness of lighting equipment required by this standard.

S6.2.2 If any required lamp or reflective device is obstructed by motor vehicle equipment (e.g., mirrors, snow plows, wrecker booms, backhoes, winches, etc.) including dealer installed equipment, and cannot meet the applicable photometry and visibility requirements, the vehicle must be equipped with an additional lamp or device of the same type which meet all applicable requirements of this standard, including photometry and visibility.
§ 571.108, N.T.

49 CFR Ch. V (10–1–08 Edition)

manufactured on or before September 1, 2011, and each multipurpose passenger vehicle, truck, trailer, and bus that is of 2032 mm or more overall width, that are manufactured on or before September 1, 2014, must have each lamp located so that it meets the visibility requirements specified in Table V-d.

S6.4.5 School bus signal lamp aiming. Each school bus signal lamp must be mounted on the vehicle with their aiming plane vertical and normal to the vehicle longitudinal axis. Aim tolerance must be no more than 3° in vertically and 10° in horizontally at 25 ft from the lamp. If the lamps are aimed or inspected by reference, see 571.108 S5.2 of this title), the graduation settings for aim must be 2° and 0° sideways for aiming and the limits must be 3° U to 7° D and from 10° R to 10° L, for inspection.

S6.5 Marking. A summary of the marking requirements of this standard and their location in the standard is contained in Table III.

S6.5.1 DOT marking. The lens of each original equipment and replacement headlamp, and of each original equipment and replacement beam contributor, and each replacement headlamp lens for an integral beam or replaceable bulb headlamp, must be marked with the symbol “DOT” either horizontally or vertically to indicate certification under 49 U.S.C. 30115.

S6.5.1.1 The DOT marking requirements for conspicuity materials are specified in S8.2 of this standard.

S6.5.1.2 Each original equipment or replacement lamp or reflective device specified in Table I, except for a headlamp, or an item of associated equipment specified in S9 may be marked with the symbol “DOT” which constitutes a certification that it conforms to the requirements of this standard.

S6.5.2 DRL marking. Each original equipment and replacement lamp used as a daytime running lamp (DRL), unless optically combined with a headlamp, must be permanently marked “DRL” on its lens in letters not less than 3 mm high.

S6.5.3 Headlamp markings.

S6.5.3.1 Trademark. The lens of each original and replacement equipment headlamp, and of each original and replacement equipment beam contributor must be marked with the name and/or trademark registered with the U.S. Patent and Trademark Office of the manufacturer of such headlamp or beam contributor, of its importer, or any manufacturer of a vehicle equipped with such headlamp or beam contributor. Nothing in this standard authorizes the marking of any such name and/or trademark by one who is not the owner, unless the owner has consented to it.

S6.5.3.2 Voltage and trade number. Each original and replacement equipment headlamp, and each original and replacement equipment beam contributor must be marked with its voltage and with its part or trade number.

S6.5.3.3 Sealed beam headlamp markings.

S6.5.3.3.1 Each sealed beam headlamp lens must be molded with “SEALED BEAM” and the appropriate designation code as shown in Table II in characters no less than 6.5 mm in size.

S6.5.3.3.2 The face of any character molded on the surface of the lens must not be raised more than 0.5 mm above the lens surface.

S6.5.3.3.3 Type 1C1, 2C1, and 2D1 headlamps must have no raised markings on the outside surface of the lens between the diameters of 49 mm and 90 mm about the lens center.

S6.5.3.3.4 Type 1A1, 2A1, 2B1, and 2E1 headlamps must have no raised markings on the outside surface of the lens within a diameter of 70 mm about the lens center.

S6.5.3.3.5 Type LF, UF, 1G1, 2G1, and 2H1 headlamps must have no raised markings on the outside surface of the lens within a diameter of 35 mm about the lens center.

S6.5.3.3.6 A Type 1C1 replacement headlamp may be marked “1” rather than “1C1”. A Type 2C1 replacement headlamp may be marked “2” rather than “2C1”. A Type 2D1 replacement headlamp may be marked “TOP” or “2” rather than “2D1”.

S6.5.3.4 Replaceable bulb headlamp markings.

S6.5.3.4.1 The lens of each replaceable bulb headlamp must bear permanent marking in front of each replaceable light source with which it is equipped that states either: The HB Type, if the light source conforms to S11 of this standard for filament light sources, or the bulb marking/designation provided in compliance with Section VIII of Appendix A of 49 CFR Part 564 (if the light source conforms to S11 of this standard for discharge light sources).

S6.5.3.4.1.1 No marking need be provided if the only replaceable light source in the headlamp is type HB1.

S6.5.3.5 Additional headlamp markings. Additional marking requirements for headlamps are found in, S10.14.4, S10.15.4, S10.17.2, S10.18.5, S10.18.7, and S10.18.9 of this standard.

S6.6 Associated equipment.

S6.6.1 All vehicles to which this standard applies, except trailers, must be equipped with a turn signal operating unit, a turn signal flasher, a turn signal pilot indicator, a headlamp beam switching device, and an upper beam headlamp indicator meeting the requirements of S9.

S6.6.2 All vehicles to which this standard applies except trailers and motorcycles must be equipped with a vehicular hazard warning
operating unit, a vehicular hazard warning signal flasher, and a vehicular hazard warning signal pilot indicator meeting the requirements of 59.

S6.6.3 License plate holder. Each rear license plate holder must be designed and constructed to provide a substantial plane surface on which to mount the plate. The plane of the license plate mounting surface and the plane on which the vehicle stands must be perpendicular within ±15°.

S6.7 Replacement equipment.

S6.7.1 General.

S6.7.1.1 Each replacement lamp, reflective device, or item of associated equipment, including a combination lamp, must:

(a) Be designed to conform to meet all requirements specified in this standard for that type of lamp, reflective device, or other item of equipment (in the case of a combination lamp, it must meet these requirements for each function); and

(b) Include all of the functions of the lamp, reflective device, or item of associated equipment, including a combination lamp, it is designed to replace or is capable of replacing (other than functions not required by this standard).

S6.7.1.2 Each replacement lamp, reflective device, or item of associated equipment, including a combination lamp, must be designed or recommended for particular vehicle models which must be designed so that it does not take the vehicle out of compliance with this standard when the individual device is installed on the vehicle. Except as provided in S6.7.1.3, the determination of whether a vehicle would be taken out of compliance with this standard when an individual device is installed on the vehicle is made assuming that the other matched paired device would be installed on the other side of the vehicle, whether or not the matched paired devices are sold together. This provision does not limit the responsibilities of manufacturers, distributors, dealers or motor vehicle repair businesses under 49 U.S.C. 30122, Making safety devices and elements inoperative.

S6.7.2 Version of this standard. The requirements of S6.7.1 must be met, at the option of the manufacturer, using either the current version of this standard or the standard in effect at the time of manufacture of the original equipment being replaced.

S7 Signal lamp requirements.

S7.1 Turn signal lamps.

S7.1.1 Front turn signal lamps.

S7.1.1.1 Number. See Tables I–a and I–c.

S7.1.1.2 Color of light. See Tables I–a and I–c.

S7.1.1.3 Mounting location. See Tables I–a and I–c.

S7.1.1.4 Mounting height. See Tables I–a and I–c.

S7.1.1.5 Activation. See Tables I–a and I–c.

S7.1.1.6 Effective projected luminous lens area. See Table IV–a.

S7.1.1.7 Visibility. See S6.4.

S7.1.1.8 Indicator. See S9.3.

S7.1.1.9 Markings. See S6.5.

S7.1.1.10 Spacing to other lamps.

S7.1.10.1 Each front turn signal lamp must also be designed to comply with any additional photometry requirements based on its installed spacing to other lamps as specified by this section. Where more than one spacing relationship exists for a turn signal lamp the requirement must be the one that specifies the highest luminous intensity multiplier of Tables VI–a and VI–b.

S7.1.10.2 Spacing measurement for non-reflector lamps. For any front turn signal lamp that does not employ a reflector to meet photometric requirements, the spacing must be measured from the light source of the turn signal lamp to the lighted edge of any lower beam headlamp, or any lamp such as an auxiliary lower beam headlamp or fog lamp used to supplement the lower beam headlamp.

S7.1.10.3 Spacing measurement for lamps with reflectors. For any front turn signal lamp which employs a reflector, such as a parabolic reflector, to meet photometric requirements, the spacing must be measured from the geometric centroid of the turn signal lamp effective projected luminous lens area to the lighted edge of any lower beam headlamp, or any lamp such as an auxiliary lower beam headlamp or fog lamp used to supplement the lower beam headlamp.

S7.1.10.4 Spacing based photometric multipliers.

(a) where the spacing measurement of S7.1.10.2 or S7.1.10.3 between a turn signal lamp and the lighted edge of any lower beam headlamp is less than 100 mm the photometric multiplier must be 2.5.

(b) where the spacing measurement of S7.1.10.2 or S7.1.10.3 between a turn signal lamp and the lighted edge of any lamp such as an auxiliary lower beam headlamp or fog lamp used to supplement the lower beam headlamp is at least 75 mm but less than 100 mm the photometric multiplier of Table VI must be 1.5.

(c) where the spacing measurement of S7.1.10.2 or S7.1.10.3 between a turn signal lamp and the lighted edge of any lamp such as an auxiliary lower beam headlamp or fog lamp used to supplement the lower beam headlamp is at least 60 mm but less than 75 mm the photometric multiplier must be 2.0.

(d) where the spacing measurement of S7.1.1.10.2 or S7.1.1.10.3 between a turn signal lamp and the lighted edge of any lamp such as an auxiliary lower beam headlamp or fog lamp used to supplement the lower beam headlamp is less than 60 mm the photometric multiplier must be 2.5.

S7.1.1.11 Multiple compartments and multiple lamps.

S7.1.1.11.1 A multiple compartment lamp or multiple lamps may be used to meet the photometric requirements of a front turn signal lamp.

S7.1.1.11.2 If a multiple compartment lamp or multiple lamps are used on a passenger car or on a multipurpose passenger vehicle, truck, trailer, or bus of less than 2032 mm in overall width, and the distance between adjacent light sources does not exceed 560 mm for two compartment or lamp arrangements and does not exceed 410 mm for three compartments or lamp arrangements, then the combination of the compartments or lamps must be used to meet the photometric requirements for the corresponding number of lighted sections specified in Tables VI–a or VI–b.

S7.1.1.11.3 If the distance between adjacent light sources exceeds the previously stated dimensions, each compartment or lamp must comply with the photometric requirements for one lighted section specified in Tables VI–a or VI–b.

S7.1.1.11.4 Lamps installed on vehicles 2032 mm or more in overall width. Multiple compartment front turn signal lamps installed on multipurpose passenger vehicles, trucks, and buses 2032 mm or more in overall width require measurement of the photometrics for the entire lamp and not for individual compartments.

S7.1.1.12 Ratio to parking lamps and clearance lamps.

S7.1.1.12.1 When a parking lamp, or a clearance lamp on a multipurpose passenger vehicle, truck, trailer, or bus of 2032 mm or more in overall width, is combined with a front turn signal lamp, the luminous intensity of the front turn signal lamp at each identified test point must not be less than the luminous intensity of the parking lamp or clearance lamp at that same test point times the multiplier shown for that test point in Tables VI–a or VI–b.

S7.1.1.12.2 If a multiple compartment or multiple lamp arrangement is used on a passenger car or on a multipurpose passenger vehicle, truck, bus, or trailer of less than 2032 mm in overall width, and the distance between the optical axes for both the parking lamp and turn signal lamp is within 560 mm for two compartment or lamp arrangements or 410 mm for three compartment or lamp arrangements, then the ratio must be computed with all compartments or lamps lighted.

S7.1.1.12.3 If a multiple compartment or multiple lamp arrangement is used and the distance between optical axes for one of the functions exceeds 560 mm for two compartment or lamp arrangements or 410 mm for three compartments or lamp arrangements, then the ratio must be computed for only those compartments or lamps where the parking lamp and turn signal lamp are optically combined.

S7.1.1.12.4 Where the clearance lamp is combined with the turn signal lamp, and the maximum luminous intensity of the clearance lamp is located below horizontal and within an area generated by a 1.0 radius around a test point, the ratio for the test point may be computed using the lowest value of the clearance lamp luminous intensity within the generated area.

S7.1.1.13 Photometry.

S7.1.1.13.1 When tested according to the procedure of S14.2.1, each front turn signal lamp must be designed to conform to the base photometry requirements plus any applicable multipliers as shown in Tables VI–a and VI–b for the number of lamp compartments or individual lamps and the type of vehicle it is installed on.

S7.1.1.13.2 As an alternative to S7.1.1.13.1, a front turn signal lamp installed on a motorcycle may be designed to conform to the photometry requirements of Table XIII–a when tested according to the procedure of S14.2.1.

S7.1.1.13.3 Physical tests. Each front turn signal lamp must be designed to conform to the performance requirements of the vibration test, moisture test, dust test, and corrosion test of S14.5, and the color test and optical material test of S14.4.

S7.1.2 Rear turn signal lamps.

S7.1.2.1 Number. See Tables I–a, I–b, and I–c.

S7.1.2.2 Color of light. See Tables I–a, I–b, and I–c.

S7.1.2.3 Mounting location. See Tables I–a, I–b, and I–c and S6.1.3.2.

S7.1.2.4 Mounting height. See Tables I–a, I–b, and I–c.

S7.1.2.5 Activation. See Tables I–a, I–b, and I–c.

S7.1.2.6 Effective projected luminous lens area. See Table IV–a.

S7.1.2.7 Visibility. See S6.4.

S7.1.2.8 Indicator. See S9.3.

S7.1.2.9 Markings. See S6.5.

S7.1.2.10 Spacing to other lamps. No requirement.

S7.1.2.11 Multiple compartments and multiple lamps.

S7.1.2.11.1 A multiple compartment lamp or multiple lamps may be used to meet the photometric requirements of a rear turn signal lamp provided the requirements of S6.1.3.2 are met.
§ 571.108, NI.

Natl’ Highway Traffic Safety Admin., DOT

S7.1.2.11.2 If a multiple compartment lamp or multiple lamps are used on a passenger car or on a multipurpose passenger vehicle, truck, bus, or trailer of less than 2032 mm in overall width, and the distance between adjacent light sources does not exceed 560 mm for two compartment or lamp arrangements and does not exceed 410 mm for three compartment or lamp arrangements, then the combination of the compartments or lamps must be used to meet the photometric requirements for the corresponding number of lighted sections specified in Table VII.

S7.1.2.11.3 If the distance between adjacent light sources exceeds the previously stated dimensions, each compartment or lamp must comply with the photometric requirements for one lighted section specified in Table VII.

S7.1.2.11.4 Lamps installed on vehicles 2032 mm or more in overall width. Multiple compartment rear turn signal lamps installed on multipurpose passenger vehicles, trucks, and buses 2032 mm or more in overall width require measurement of the photometrics for the entire lamp and not for individual compartments.

S7.1.2.12 Ratio to taillamps and clearance lamps.

S7.1.2.12.1 When a taillamp, or a clearance lamp on a multipurpose passenger vehicle, truck, trailer, or bus of 2032 mm or more in overall width, is combined with a rear turn signal lamp, the luminous intensity of the rear turn signal lamp at each identified test point must not be less than the luminous intensity of the taillamp or clearance lamp at that same test point times the multiplier shown for that test point in Table VII.

S7.1.2.12.2 If a multiple compartment or multiple lamp arrangement is used on a passenger car and on a multipurpose vehicle, truck, bus, or trailer of less than 2032 mm in overall width, and the distance between the optical axes for both the taillamp and turn signal lamp is within 560 mm for two compartment or lamp arrangement or 410 mm for three compartments or lamp arrangements, then the ratio must be computed with all compartments or lamps lighted.

S7.1.2.12.3 If a multiple compartment or multiple lamp arrangement is used and the distance between optical axes for one of the functions exceeds 560 mm for two compartment or lamp arrangements or 410 mm for three compartment or lamp arrangements, then the ratio must be computed for only those compartments or lamps where the taillamp and turn signal lamp are optically combined.

S7.1.2.12.4 Where the taillamp or clearance lamp is combined with the turn signal lamp, and the maximum luminous intensity of the taillamp or clearance lamp is located below horizontal and within an area generated by a 0.5° radius around a test point for a taillamp on a passenger car or on a multipurpose passenger vehicle, truck, bus, or trailer of less than 2032 mm in overall width, or by a 1.0° radius around a test point for a taillamp or clearance lamp on a vehicle 2032 mm or more in overall width, the ratio for the test point may be computed using the lowest value of the taillamp or clearance lamp luminous intensity within the generated area.

S7.1.2.13 Photometry.

S7.1.2.13.1 Each rear turn signal lamp must be designed to conform to the photometry requirements of Table VII, when tested according to the procedure of S14.2.1, for the number of lamp compartments or individual lamps, the type of vehicle it is installed on, and the lamp color as specified by this section.

S7.1.2.13.2 As an alternative to S7.1.2.13.1, a rear turn signal lamp installed on a motorcycle may be designed to conform to the photometry requirements of Table XIII-a when tested according to the procedure of S14.2.1.

S7.1.2.14 Physical tests. Each rear turn signal lamp must be designed to conform to the performance requirements of the vibration test, moisture test, dust test, and corrosion test of S14.5, and the color test and plastic optical material test of S14.4.

S7.1.3 Combined lamp bulb indexing.

S7.1.3.1 Each turn signal lamp optically combined with a taillamp or a parking lamp, or clearance lamp where installed on a vehicle 2032 mm or more in overall width, where a two-filament bulb is used must have a bulb with an indexing base and a socket designed so that bulbs with non-indexing bases cannot be used.

S7.1.3.2 Removable sockets must have an indexing feature so that they cannot be reinserted into lamp housings in random positions, unless the lamp will perform its intended function with random light source orientation.

S7.2 Taillamps.

S7.2.1 Number. See Tables I-a, I-b, and I-c.

S7.2.2 Color of light. See Tables I-a, I-b, and I-c.

S7.2.3 Mounting location. See Tables I-a, I-b, and I-c and S6.1.3.2.

S7.2.4 Mounting height. See Tables I-a, I-b, and I-c.

S7.2.5 Activation. See Tables I-a, I-b, and I-c.

S7.2.6 Effective projected luminous lens area. No requirement.

S7.2.7 Visibility. See S6.4.

S7.2.8 Indicator. No requirement.

S7.2.9 Markings. See S6.5.

S7.2.10 Spacing to other lamps. No requirement.

S7.2.11 Multiple compartments and multiple lamps.

S7.2.11.1 A multiple compartment lamp or multiple lamps may be used to meet the photometric requirements of a taillamp provided the requirements of S6.1.3.2 are met.

S7.2.11.2 If a multiple compartment lamp or multiple lamps are used and the distance between the optical axes does not exceed 560 mm for two compartment or lamp arrangements and does not exceed 410 mm for three compartment or lamp arrangements, then the combination of the compartments or lamps must be designed to meet the photometric requirements for the corresponding number of lighted sections specified in Table VIII.

S7.2.11.3 If the distance between optical axes exceeds the previously stated dimensions, each compartment or lamp must comply with the photometric requirements for one lighted section specified in Table VIII.

S7.2.11.4 Taillamps installed on vehicles 2032 mm or more in overall width. A maximum of two taillamps and/or two compartments per side may be mounted closer together than 560 mm providing that each compartment and/or lamp meets the single lighted section photometric requirements specified in Table VIII. Each lamp and/or compartment utilized in this manner must meet the single lighted section requirements for all functions for which it is designed.

S7.2.12 Ratio. See S7.2.12 for rear turn signal lamps and S7.3.12 for stop lamps.

S7.2.13 Photometry. Each taillamp must be designed to conform to the performance requirements of the vibration test, moisture test, dust test, and corrosion test of S14.5, and the color test and plastic optical material test of S14.4.

S7.3 Stop lamps.

S7.3.1 Number. See Tables I-a, I-b, and I-c.

S7.3.2 Color of light. See Tables I-a, I-b, and I-c.

S7.3.3 Mounting location. See Tables I-a, I-b, and I-c and S6.1.3.2.

S7.3.4 Mounting height. See Tables I-a, I-b, and I-c.

S7.3.5 Activation. See Tables I-a, I-b, and I-c.

S7.3.6 Effective projected luminous lens area. See Table IV-a.

S7.3.7 Visibility. See S6.4.

S7.3.8 Indicator. No requirement.

S7.3.9 Markings. See S6.5.

S7.3.10 Spacing to other lamps. No requirement.

S7.3.11 Multiple compartments and multiple lamps.

S7.3.11.1 A multiple compartment lamp or multiple lamps may be used to meet the photometric requirements of a stop lamp provided the requirements of S6.1.3.2 are met.

S7.3.11.2 If a multiple compartment lamp or multiple lamps are used on a passenger car or on a multipurpose passenger vehicle, truck, bus, or trailer of less than 2032 mm in overall width, and the distance between adjacent light sources does not exceed 560 mm for two compartment or lamp arrangements and does not exceed 410 mm for three compartment or lamp arrangements, then the combination of the compartments or lamps must be used to meet the photometric requirements for the corresponding number of lighted sections specified in Table IX.

S7.3.11.3 If the distance between adjacent light sources exceeds the previously stated dimensions, each compartment or lamp must comply with the photometric requirements for one lighted section specified in Table IX.

S7.3.11.4 Lamps installed on vehicles 2032 mm or more in overall width. Multiple compartment stop lamps installed on multipurpose passenger vehicles, trucks, and buses 2032 mm or more in overall width require measurement of the photometrics for the entire lamp and not for individual compartments.

S7.3.12 Ratio to taillamps.

S7.3.12.1 When a taillamp is combined with a stop lamp, the luminous intensity of the stop lamp at each identified test point must be not less than the luminous intensity of the taillamp at that same test point times the multiplier shown for that test point in Table IX.

S7.3.12.2 If a multiple compartment or multiple lamp arrangement is used on a passenger car or on a multipurpose passenger vehicle, truck, bus, or trailer of less than 2032 mm in overall width, and the distance between the optical axes for both the taillamp and stop lamp is within 560 mm for two compartment or lamp arrangements or 410 mm for three compartment or lamp arrangements, then the ratio must be computed for only those compartments or lamps where the taillamp and stop lamp are optically combined.

S7.3.12.3 If a multiple compartment or multiple lamp arrangement is used and the distance between optical axes for one of the functions exceeds 560 mm for two compartment or lamp arrangements or 410 mm for three compartments or lamp arrangements, then the ratio must be computed for only those compartments or lamps where the taillamp and stop lamp are optically combined.

S7.3.12.4 Where the taillamp is combined with the stop lamp, and the maximum luminous intensity of the taillamp is located below horizontal and within an area generated by a 0.5° radius around a test point for a taillamp on a passenger car or on a multipurpose passenger vehicle, truck, bus, or trailer of less than 2032 mm in overall width, or by a 1.0° radius around a test point...
for a taillamp on a vehicle 2032 mm or more in overall width, the ratio for the test point may be computed using the lowest value of the taillamp luminous intensity within the generated area.

S7.3.13 Photometry.
S7.3.13.1 Each stop lamp must be designed to conform to the photometry requirements of Table IX, when tested according to the procedure of S14.2.1, for the number of lamp compartments or individual lamps and the type of vehicle it is installed on.

S7.3.15.2 A lamp installed on a motor driven cycle may be designed to conform to the photometry requirements of Table XIII-b when tested according to the procedure of S14.2.1.

S7.3.14 Physical tests. Each stop lamp must be designed to conform to the performance requirements of the vibration test, moisture test, dust test, and corrosion test of S14.5, and the color test and plastic optical material test of S14.4.

S7.3.15 Combined lamp bulb indexing.
S7.3.15.1 Each stop lamp optically combined with a taillamp where a two-filament bulb is used must have a bulb with an indexing base and a socket designed so that bulbs with non-indexing bases cannot be used.

S7.3.15.2 Removable sockets must have an indexing feature so that they cannot be reinserted into lamp housings in random positions, unless the lamp will perform its intended function with random light source orientation.

S7.4 Side marker lamps.
S7.4.1 Number. See Tables I-a, I-b, and I-c.
S7.4.2 Color of light. See Tables I-a, I-b, and I-c.
S7.4.3 Mounting location. See Tables I-a, I-b, and I-c.
S7.4.4 Mounting height. See Tables I-a, I-b, and I-c.
S7.4.5 Activation. See Tables I-a, I-b, and I-c.
S7.4.6 Effective projected luminous lens area. No requirement.
S7.4.7 Visibility. No requirement.
S7.4.8 Indicator. No requirement.
S7.4.9 Markings. See S6.5.
S7.4.10 Spacing to other lamps. No requirement.
S7.4.11 Multiple compartments and multiple lamps. No requirement.

S7.5 Clearance and identification lamps.
S7.5.1 Number. See Tables I-a and I-b.
S7.5.2 Color of light. See Tables I-a and I-b.
S7.5.3 Mounting location. See Tables I-a and I-b.
S7.5.4 Mounting height. See Tables I-a and I-b.
S7.5.5 Activation. See Tables I-a and I-b.
S7.5.6 Effective projected luminous lens area. No requirement.
S7.5.7 Visibility. No requirement.
S7.5.8 Indicator. No requirement.
S7.5.9 Markings. See S6.5.
S7.5.10 Spacing to other lamps. No requirement.
S7.5.11 Multiple compartments and multiple lamps. No requirement.
S7.5.12 Ratio. See Table I-a.

S7.6 Backup lamps.
S7.6.1 Number. See Table I-a and S6.1.1.
S7.6.2 Color of light.
S7.6.3 Mounting location. See Table I-a.
S7.6.4 Mounting height. No requirement.
S7.6.5 Activation. See Table I-a.
S7.6.6 Effective projected luminous lens area. No requirement.
S7.6.7 Visibility. See Table V-a.
S7.6.8 Indicator. No requirement.
S7.6.9 Markings. See S6.5.
S7.6.10 Spacing to other lamps. No requirement.
S7.6.11 Multiple compartments and multiple lamps. No requirement.
S7.6.12 Ratio. No requirement.
§ 571.108, N.T.

S7.6.13 Photometry. Each backup lamp must be designed to conform to the photometry requirements of Table XII, when tested according to the procedure of S14.2.1, as specified by this section.

S7.6.14 Physical tests. Each backup lamp must be designed to conform to the performance requirements of the vibration test, moisture test, dust test, and corrosion test of S14.5, and the color test and plastic optical material test of S14.4.

S7.7 License plate lamps.

S7.7.1 Number. See Tables I–a, I–b, and I–c and S6.1.1.

S7.7.2 Color of light. See Tables I–a, I–b, and I–c.

S7.7.3 Mounting location. See Tables I–a, I–b, and I–c.

S7.7.4 Mounting height. See Tables I–a, I–b, and I–c.

S7.7.5 Activation. See Tables I–a, I–b, and I–c.

S7.7.6 Effective projected luminous lens area. No requirement.

S7.7.7 Visibility. No requirement.

S7.7.8 Indicator. No requirement.

S7.7.9 Markings. See S6.5.

S7.7.10 Spacing to other lamps. No requirement.

S7.7.11 Multiple compartments and multiple lamps. No requirement.

S7.7.12 Ratio. No requirement.

S7.7.13 Photometry. Each license plate lamp must be designed to conform to the photometry requirements of this section when tested according to the procedure of S14.2.2.

S7.7.13.2 An illumination value of no less than 8 lx (0.75 fc) must be met at each test station target location shown in Figure 19.

S7.7.13.3 The ratio of the average of the two highest illumination values divided by the average of the two lowest illumination values must not exceed 20:1 for vehicles other than motorcycles and motor driven cycles.

S7.7.13.4 The ratio of the highest illumination value divided by the average of the two lowest illumination values must not exceed 20:1 for vehicles other than motorcycles and motor driven cycles.

S7.7.14 Physical tests. Each license plate lamp must be designed to conform to the performance requirements of the vibration test, moisture test, dust test, and corrosion test of S14.5, and the color test and plastic optical material test of S14.4.

S7.7.15 Installation.

S7.7.15.1 Each license plate lamp installed on a vehicle other than a motorcycle or motor driven cycle must be of such size and design as to provide illumination on all parts of a 100 mm by 175 mm test plate.

S7.7.15.2 Each license plate lamp installed on a motorcycle or motor driven cycle must be of such size and design as to provide illumination on all parts of a 150 mm by 300 mm test plate.

S7.7.15.3 The light rays must reach all portions of an imaginary plate of the same size at least 25 mm ahead of the actual plate measured perpendicular to the plane of the plate.

S7.7.15.4 Incident light from single lamp. When a single lamp as shown in Figure 20 is used to illuminate the license plate, the lamp and license plate holder must bear such relation to each other that at no point on the plate must the incident light make an angle of less than 8° to the plane of the plate, this angle being measured from the edge of the light emitting surface of the lamp farthest from the surface of the plate.

S7.7.15.5 Incident light from multiple lamps. When two or more lamps as shown in Figure 20 are used to illuminate the license plate, the minimum 8° incident light angle must apply only to that portion of the plate which the particular lamp is designed to illuminate. The angle must be measured in the same manner as S7.7.15.4.

S7.8 Parking lamps.

S7.8.1 Number. See Table I–a.

S7.8.2 Color of light. See Table I–a.

S7.8.3 Mounting location. See Table I–a.

S7.8.4 Mounting height. See Table I–a.

S7.8.5 Activation. See Table I–a.

S7.8.6 Effective projected luminous lens area. No requirement.

S7.8.7 Visibility. See S6.4.

S7.8.8 Indicator. No requirement.

S7.8.9 Markings. See S6.5.

S7.8.10 Spacing to other lamps. No requirement.

S7.8.11 Multiple compartments and multiple lamps. No requirement.

S7.8.12 Ratio. See S7.1.1.12 for front turn signal lamps.

S7.8.13 Photometry. Each parking lamp must be designed to conform to the photometry requirements of Table XIV, when tested according to the procedure of S14.2.1, as specified by this section.

S7.8.14 Physical tests. Each parking lamp must be designed to conform to the performance requirements of the vibration test, moisture test, dust test, and corrosion test of S14.5, and the color test and plastic optical material test of S14.4.

S7.9 High-mounted stop lamps.

S7.9.1 Number. See Table I–a and S6.1.1.2.

S7.9.2 Color of light. See Table I–a.

S7.9.3 Mounting location. See Table I–a.

S7.9.4 Mounting height. See Table I–a and S6.1.4.1.

S7.9.5 Activation. See Table I–a.

S7.9.6 Effective projected luminous lens area. See Table IV–b.

S7.9.7 Visibility. See Table V–a.

S7.9.8 Indicator. No requirement.

S7.9.9 Markings. See S6.5.

S7.9.10 Spacing to other lamps. No requirement.
§ 571.108  Nl.

S7.9.11  Multiple compartments and multiple lamps. No requirement.
S7.9.12  Ratio. No requirement.
S7.9.13  Photometry. Each high-mounted stop lamp must be designed to conform to the photometry requirements of Table XV, when tested according to the procedure of S14.2.1, as specified by this section.
S7.9.14  Physical tests.
S7.9.14.1  Each high-mounted stop lamp must be designed to conform to the performance requirements of the vibration test of S14.5, and the color test and plastic optical material test of S14.4.
S7.9.14.1.1  Each high-mounted stop lamp that is not mounted inside the vehicle must be designed to conform to the performance requirements of the moisture test, dust test, and corrosion test of S14.5.
S7.10  Daytime running lamps (DRLs).
S7.10.1  Number. See Table I–a.
S7.10.2  Color of light. See Table I–a.
S7.10.3  Mounting location. See Table I–a.
S7.10.4  Mounting height. See Table I–a, and S7.10.13(b).
S7.10.5  Activation. See Table I–a, and S7.10.10(c).
S7.10.6  Effective projected luminous lens area. No requirement.
S7.10.7  Visibility. No requirement.
S7.10.8  Indicator. No requirement.
S7.10.9  Markings. See S6.5.
S7.10.10  Spacing to other lamps.
S7.10.10.1  Spacing to turn signal lamps. Each DRL not optically combined with a turn signal lamp must be located on the vehicle so that the distance from its lighted edge to the optical center of the nearest turn signal lamp is not less than 100 mm unless,
(a) The luminous intensity of the DRL is not more than 2,600 cd at any location in the beam and the turn signal lamp meets 2.5 times the base front turn signal photometric requirements, or
(b) The DRL is optically combined with a lower beam headlamp and the turn signal lamp meets 2.5 times the base front turn signal photometric requirements, or
(c) The DRL is deactivated when the turn signal or hazard warning signal lamp is activated.
S7.10.11  Multiple compartments and multiple lamps. No requirement.
S7.10.12  Ratio. No requirement.
S7.10.13  Photometry. Each DRL must have a luminous intensity not less than 500 cd at test point H–V, nor more than 3,000 cd at any location in the beam when tested according to the procedure of S14.2.4 as specified by this section, unless it is:
(a) A lower beam headlamp intended to operate as a DRL at full voltage, or a voltage lower than used to operate it as a lower beam headlamp, or
(b) An upper beam headlamp intended to operate as a DRL, whose luminous intensity at test point H–V is not more than 7,000 cd, and whose mounting height is not higher than 864 mm.
S7.10.14  Physical tests. Each DRL that is not combined with another required lamp must be designed to conform to the performance requirements of the color test and plastic optical material test of S14.4.
S7.11  School bus signal lamps.
S7.11.1  Number. See Table I–a.
S7.11.2  Color of light. See Table I–a.
S7.11.3  Mounting location. See Table I–a.
S7.11.4  Mounting height. See Table I–a.
S7.11.5  Activation. See Table I–a.
S7.11.6  Effective projected luminous lens area. See Table IV–c.
S7.11.7  Visibility. See Table V–a.
S7.11.8  Indicator. No requirement.
S7.11.9  Markings. See S6.5.
S7.11.10  Spacing to other lamps. No requirement.
S7.11.11  Multiple compartments and multiple lamps. No requirement.
S7.11.12  Ratio. No requirement.
S7.11.13  Photometry. Each school bus signal lamp must be designed to conform to the photometry requirements of Table XVII, when tested according to the procedure of S14.2.1, for the lamp color as specified by this section.
S7.11.14  Physical tests. Each school bus signal lamp must be designed to conform to the performance requirements of the vibration test, moisture test, dust test, and corrosion test of S14.5, and the color test and plastic optical material test of S14.4.
S8  Reflective device requirements.
S8.1  Reflex reflectors.
S8.1.1  Number. See Tables I–a, I–b, and I–c.
S8.1.2  Color. See Tables I–a, I–b, and I–c.
S8.1.3  Mounting location. See Tables I–a, I–b, and I–c.
S8.1.5  Activation. No requirement.
S8.1.6  Effective projected luminous lens area. No requirement.
S8.1.7  Visibility. No requirement.
S8.1.8  Indicator. No requirement.
S8.1.9  Markings. See S6.5.
S8.1.10  Spacing to other lamps or reflective devices. No requirement.
S8.1.11  Photometry. Each reflex reflector must be designed to conform to the photometry requirements of Table XVI–a when tested according to the procedure of S14.2.3 for the reflex reflector color as specified by this section.
S8.1.12  Physical tests. Each reflex reflector must be designed to conform to the performance requirements of the vibration test, moisture test, dust test, and corrosion test of S14.5, and the color test and plastic optical material test of S14.4.
S8.1.13  Alternative side reflex reflector material. Reflective material conforming to Federal Specification L-S-300, Sheeting and
§ 571.108, N.T.

Tape, Reflective; Non-exposed Lens, Adhesive Backing, (September 7, 1965) (incorporated by reference, see 571.108 S5.2 of this title), may be used for side reflex reflectors if this material as used on the vehicle, meets the performance requirements of Table XVI–a.

S8.2 Conspicuity systems. The requirement for conspicuity systems may be met with retroreflective sheeting, conspicuity reflex reflectors, or a combination of retroreflective sheeting and conspicuity reflex reflectors.

S8.2.1 Retroreflective sheeting.

S8.2.1.1 Retroreflective sheeting must consist of a smooth, flat, transparent external film with retroreflective elements embedded or suspended beneath the film so as to form a non-exposed retroreflective optical system.

S8.2.1.2 Retroreflective sheeting material. Retroreflective sheeting must meet the requirements, except photometry, of ASTM D 4956–90, Standard for Retroreflective Sheet for Traffic Control, (incorporated by reference, see 571.108 S5.2 of this title) for Type V Sheetirng. Sheetng of Grade DOT–C2 of no less than 50 mm wide, Grade DOT–C3 of no less than 75 mm wide, or Grade DOT–C4 of no less than 100 mm wide may be used.

S8.2.1.3 Certification marking. The letters DOT–C2, DOT–C3, or DOT–C4, as appropriate, constituting a certification that the retroreflective sheeting conforms to the requirements of this standard, must appear at least once on the exposed surface of each white or red segment of retroreflective sheeting, and at least once every 300 mm on retroreflective sheeting that is white only. The characters must not be less than 3 mm high, and must be permanently stamped, etched, molded, or printed in indelible ink.

S8.2.1.4 Application pattern.

S8.2.1.5 Application location. Need not be installed, as illustrated in Figure 12–2, on discontinuous surfaces such as outside ribs, stake post pickets on platform trailers, and external protruding beams, or to items of equipment such as door hinges and lamp bodies on trailers and body joints, stiffening beads, drip rails, and rolled surfaces on truck tractor.

S8.2.1.6 Application spacing. As illustrated in Figure 12–2, the edge of any white sheeting must not be located closer than 75 mm to the edge of the luminous lens area of any red or amber lamp that is required by this standard. The edge of any red sheeting must not be located closer than 75 mm to the edge of the luminous lens area of any amber lamp that is required by this standard.

S8.2.1.7 Photometry. Each retroreflective sheeting must be designed to conform to the photometry requirements of Table XVI–c when tested according to the procedure of S14.2.3 for the color and grade as specified by this section.

S8.2.2 Conspicuity reflex reflectors.

S8.2.2.1 Certification marking. The exposed surface of each conspicuity reflex reflector must be marked with the letters DOT–C which constitutes a certification that the reflector conforms to the conspicuity reflex reflector requirements of this standard. The certification must be not less than 3 mm high, and must be permanently stamped, etched, molded, or printed in indelible ink.

S8.2.2.2 Application pattern.

S8.2.2.3 Photometry.

S8.2.2.3.1 Each red conspicuity reflex reflector must be designed to conform to the photometry requirements of Table XVI–a for a red reflex reflector and Table XVI–b for a red conspicuity reflex reflector when tested according to the procedure of S14.2.3 as specified by this section.

S8.2.2.3.2 Each white conspicuity reflex reflector installed in only a horizontal orientation must be designed to conform to the photometry requirements of Table XVI–a for a white reflex reflector and Table XVI–b for a white horizontal conspicuity reflex reflector when tested according to the procedure of S14.2.3 as specified by this section.

S8.2.2.3.3 Each white conspicuity reflex reflector installed in a vertical orientation must be designed to conform to the photometry requirements of Table XVI–a for a white reflex reflector, and Table XVI–b for a white horizontal conspicuity reflex reflector and a white vertical conspicuity reflex reflector when tested according to the procedure of S14.2.3 as specified by this section.

S8.2.3 Conspicuity system installation on trailers.

S8.2.3.1 Trailer rear.
§ 571.108, NI.

Natl’l Highway Traffic Safety Admin., DOT

82.3.1.1 Element 1—alternating red and white materials. As shown in Figure 11, a strip of sheeting or conspicuity reflex reflectors, as horizontal as practicable, must be applied across the full width of the trailer, as close to the extreme edges as practicable, and as close as practicable to not less than 375 mm and not more than 1525 mm above the road surface at the strip centerline with the trailer at curb weight.

82.3.1.2 Element 2—white. (not required for container chassis or for platform trailers without bulkheads).

82.3.1.2.1 As shown in Figure 11, two pairs of strips of sheeting or conspicuity reflex reflectors, each pair consisting of strips 300 mm long of Grade DOT-C2, DOT-C3, or DOT-C4, must be applied horizontally and vertically to the right and left upper contours of the body, as viewed from the rear, as close to the top of the trailer and as far apart as practicable.

82.3.1.2.2 If the perimeter of the body, as viewed from the rear, is other than rectangular, the strips may be applied along the perimeter, as close as practicable to the uppermost and outermost areas of the rear of the body on the left and right sides.

82.3.1.3 Element 3—alternating red and white materials. (not required for trailers without underride protection devices).

82.3.1.3.1 As shown in Figure 11, a strip of Grade DOT-C2 sheeting no less than 38 mm wide or reflectors must be applied across the full width of the horizontal member of the rear underride protection device.

82.3.2 Trailer side—alternating red and white materials.

82.3.2.1 As shown in Figure 11, a strip of sheeting or conspicuity reflex reflectors must be applied to each side, as horizontal as practicable, originating and terminating as close to the front and rear as practicable, as close as practicable to not less than 375 mm and not more than 1525 mm above the road surface at the strip centerline at curb weight, except that at the location chosen the strip must not be obscured in whole or in part by other motor vehicle equipment or trailer cargo.

82.3.2.2 The strip need not be continuous as long as not less than half the length of the trailer is covered and the spaces are distributed as evenly as practicable.

82.3.2.3 If necessary to clear rivet heads or other similar obstructions, Grade DOT-C2 sheeting may be separated into two 25 mm wide strips of the same length and color, separated by a space of not more than 25 mm and used in place of the retroreflective sheeting that would otherwise be applied.

82.4 Conspicuity system installation on truck tractors.

82.4.1 Element 1—alternating red and white materials. As shown in Figure 13, two strips of sheeting or conspicuity reflex reflectors, each not less than 600 mm long, located as close as practicable to the edges of the rear fenders, mudflaps, or the mudflap support brackets, must be applied to mark the width of the truck tractor.

82.4.1.1 The strips must be mounted as horizontal as practicable, in a vertical plane facing the rear, on the rear fenders, on the mudflap support brackets, or mounted on the mudflap support brackets, or on the mudflaps.

82.4.1.2 Strips on mudflaps must be mounted not lower than 300 mm below the upper horizontal edge of the mudflap. If the vehicle is certified with temporary mudflap support brackets, the strips must be mounted on the mudflaps or on plates transferable to permanent mudflap support brackets.

82.4.1.3 For a truck tractor without mudflaps, the strips may be mounted on board of the frame or brackets behind the rear axle or on brackets ahead of the rear axle and above the top of the rear tires at unladen vehicle height, or they may be mounted directly or indirectly to the back of the cab as close to the outer edges as practicable, above the top of the tires, and not more than 1525 mm above the road surface at unladen vehicle height.

82.4.1.4 If the strips are mounted on the back of the cab, no more than 25% of their cumulative area may be obscured by vehicle equipment as determined in a rear orthogonal view.

82.4.2 Element 2—white. As shown in Figure 13, two pairs of strips of sheeting or conspicuity reflex reflectors, each pair consisting of strips 300 mm long, must be applied horizontally and vertically as practicable to the right and left upper contours of the cab, as close to the top of the cab and as far apart as practicable.

82.4.2.1 No more than 25% of their cumulative area may be obscured by vehicle equipment as determined in a rear orthogonal view.

82.4.2.2 If one pair must be relocated to avoid obscuration by vehicle equipment, the other pair may be relocated in order to be mounted symmetrically.

82.4.2.3 If the rear window is so large as to occupy all the practicable space, the material may be attached to the edge of the window itself.

89 Associated equipment requirements.

89.1 Turn signal operating unit.

89.1.1 The turn signal operating unit installed on passenger cars, multipurpose passenger vehicles, trucks, and buses less than 2002 mm in overall width must be self-canceling by steering wheel rotation and capable of cancellation by a manually operated control.

89.1.2 Physical tests. Each turn signal operating unit must be designed to conform to all applicable performance requirements of §145.

89.2 Turn signal flasher.
§ 571.108, N.I.

S9.2.1 The means of producing the turn signal pilot indicator signal may be incorporated in the flasher. A means of producing an audible signal may be incorporated in the flasher.

S9.2.2 Physical tests. Each turn signal flasher must be designed to conform to all applicable performance requirements of §14.9.

S9.3 Turn signal pilot indicator.

S9.3.1 Each vehicle equipped with a turn signal operating unit where any turn signal lamp is not visible to the driver must also have an illuminated pilot indicator to provide a clear and unmistakable indication that the turn signal system is activated.

S9.3.2 The indicator must consist of one or more lights flashing at the same frequency as the turn signal lamps.

S9.3.3 The indicator function satisfactorily under all test conditions imposed on the turn signal flasher in §14.9.

S9.3.4 Indicator size and color.

S9.3.4.1 If the indicator is located inside the vehicle it must emit a green colored light and have a minimum area equivalent to a 3⁄16 in diameter circle.

S9.3.4.2 If the indicator is located outside of the vehicle it must emit a yellow light and have a minimum projected illuminated area of 0.1 sq in.

S9.3.5 The minimum required illuminated area of the indicator must be visible to any tangent on the 95th ellipse as defined in SAE J441b, Motor Vehicle Driver’s Eye Range, February 1969, (incorporated by reference, see 571.108 $.2 of this title) with the steering wheel turned to a straight ahead driving position and in the design location for an adjustable wheel or column.

S9.3.6 Turn signal lamp failure. Failure of one or more turn signal lamps such that the minimum photometric performance specified in Tables VI or VII is not being met must be indicated by the turn signal pilot indicator by a “steady on”, “steady off”, or by a significant change in the flashing rate, except when a variable-load turn signal flasher is used on a multipurpose passenger vehicle, truck, or bus 2032 mm or more in overall width, on a truck that is capable of accommodating a slide in camper, or on any vehicle equipped to tow trailers.

S9.4 Headlamp beam switching device. Each vehicle must have a means of switching between lower and upper beams designed and located so that it may be operated conveniently by a simple movement of the driver’s hand or foot. The switch must have no dead point and, except as provided by S6.1.5.2, the lower and upper beams must not be energized simultaneously except for temporary signaling purposes or during switching between beams.

S9.4.1 Semi-automatic headlamp beam switching device. As an alternative to S9.4, a vehicle may be equipped with a semi-automatic means of switching between lower and upper beams.

S9.4.1.1 Operating instructions. Each semi-automatic headlamp switching device must include operating instructions to permit a driver to operate the device correctly including; how to turn the automatic control on and off, how to adjust the provided sensitivity control, and any other specific instructions applicable to the particular device.

S9.4.1.2 Manual override. The device must include a means convenient to the driver for switching to the opposite beam from the one provided.

S9.4.1.3 Fail safe operation. A failure of the automatic control portion of the device must not result in the loss of manual operation of both upper and lower beams.

S9.4.1.4 Automatic dimming indicator. There must be a convenient means of informing the driver when the device is controlling the headlamps automatically. The device shall not affect the function of the upper beam indicator light.

S9.4.1.5 Lens accessibility. The device lens must be accessible for cleaning when the device is installed on a vehicle.

S9.4.1.6 Mounting height. The center of the device lens must be mounted no less than 24 in. above the road surface.

S9.4.1.7 Physical tests. Each semi-automatic headlamp beam switching device must be designed to conform to all applicable performance requirements of §14.9.

S9.5 Upper beam headlamp indicator. Each vehicle must have a means for indicating to the driver when the upper beams of the headlighting system are activated.

S9.5.1 Indicator size and location. The upper beam headlamp indicator must have a minimum area equivalent to that of a 3⁄16 in diameter circle, and be plainly visible to drivers of all heights under normal driving conditions when headlamps are required.

S9.6 Vehicular hazard warning signal operating unit.

S9.6.1 The unit may be an independent device or it may be combined with the turn signal operating unit. If combined with the turn signal operating unit, the actuating motion of the hazard function must differ from the actuating motion of the turn signal function.

S9.6.2 Operating unit switch. The unit must operate independently of the ignition or equivalent switch. If the actuation of the hazard function requires the operation of more than one switch, a means must be provided for actuating all switches simultaneously by a single driver action.

S9.6.3 Physical tests. Each vehicular hazard warning signal operating unit must be designed to conform to all applicable performance requirements of §14.9.

S9.7 Vehicular hazard warning signal flasher.
§ 571.108, NI.

S9.7.1 The means of producing the hazard warning signal pilot indicator signal may be incorporated in the flasher. A means of producing an audible signal may be incorporated in the flasher.

S9.7.2 Physical tests. Each vehicular hazard warning signal flasher must be designed to conform to all applicable performance requirements of S14.9.

S9.8 Vehicular hazard warning signal pilot indicator.

S9.8.1 In vehicles equipped with right hand and left hand turn signal pilot indicators, both pilot indicators and/or a separate pilot indicator must flash simultaneously while the vehicle hazard warning signal operating unit is turned on.

S9.8.2 In vehicles equipped with a single turn signal pilot indicator, a separate vehicular hazard warning signal pilot indicator must flash and the turn signal pilot indicator may flash while the vehicle hazard warning signal operating unit is turned on.

S9.8.3 The indicator must function satisfactorily under all test conditions imposed on the vehicular hazard warning signal flasher in S14.9.

S9.8.4 Indicator size and color. If the vehicular hazard warning signal pilot indicator is not combined with the turn signal pilot indicator, it must emit a red color and have a minimum area equivalent to 0.5 in diameter circle.

S10 Headlighting system requirements.

S10.1 Vehicle headlighting systems.

S10.1.1 Each passenger car, multipurpose passenger vehicle, truck and bus must be equipped with a headlighting system conforming to the requirements of Table II and this standard.

S10.1.2 Each motorcycle must be equipped with a headlighting system conforming to S10.17 of this standard or one half of any headlighting system of Table II which provides both a full upper beam and full lower beam.

S10.2 Aiming. Each headlamp system installed on a motor vehicle must be aimable in accordance with the requirements of S10.18.

S10.3 Number. See Tables I-a and I-c.

S10.4 Color of light. See Tables I-a and I-c.

S10.5 Mounting location. See Tables I-a and I-c and S6.1.3.5.

S10.6 Mounting height. See Tables I-a and I-c.

S10.7 Activation. See Tables I-a and I-c, Table II, and S6.1.5.

S10.8 Effective projected luminous lens area. No requirement.

S10.9 Visibility. No requirement.

S10.10 Indicator. See S9.5.

S10.11 Markings. See S6.5.

S10.12 Spacing to other lamps. See S6.1.3.5.

S10.13 Sealed beam headlighting systems. All sealed beam headlighting systems must be of a type designated in Table II-a. Each sealed beam headlamp must be designed to conform to the specifications furnished with respect to it pursuant to Appendix C of Part 564 of this chapter and Table II-a of this standard. The dimensions applicable to the design of a specific type are those identified with an “I” for interchangeability specified on the applicable drawing(s) filed in Docket No. NHTSA 96-397.

S10.13.1 Installation. A sealed beam headlighting system must consist of the correct number of designated headlamp units as specified for the applicable system in Table II-a. The units must have their beams activated as specified in Table II-a. A system must provide in total not more than two upper beams and two lower beams.

S10.13.2 Simultaneous aim. Type F sealed beam headlamps may be mounted on common or parallel seating and aiming planes to permit simultaneous aiming of both headlamps provided that there is no provision for adjustment between the common or parallel aiming and seating planes of the two lamps. When tested with any conforming Type UF and LF headlamps in accordance with S14.2.5, the assembly (consisting of the Type UF and LF headlamps, mounting rings, the aiming/seating rings, and aim adjustment mechanism) must be designed to conform to the applicable photometric requirements.

S10.13.3 Photometry. Each sealed beam headlamp must be designed to conform to the photometry requirements of Table XVIII for upper beam and Table XIX for lower beam as specified in Table II-a for the specific headlamp unit and aiming method, when tested according to the procedure of S14.2.5.

S10.14 Physical tests.

S10.14.1 Each sealed beam headlamp must be designed to conform to the performance requirements of the corrosion test, vibration test, inward force test, torque deflection test, headlamp connector test, headlamp wattage test, and aiming adjustment tests of S14.6.

S10.14.2 Each sealed beam headlamp except a Type G or Type H must be designed to conform to the performance requirements of the retaining ring test of S14.6.

S10.14.3 Each sealed beam headlamp must be designed to conform to the performance requirements of the color test of S14.4. Each sealed beam headlamp that does not incorporate a glass lens must be designed to conform to the plastic optical materials test of S14.4.

S10.14 Integral beam headlighting systems.

S10.14.1 Installation. An integral beam headlighting system must consist of the correct number of designated headlamp units as specified for the applicable system in Table
§ 571.108, N1.

II-c. The units must have their beams activated as specified in Table II-c. A system must provide in total not more than two upper beams and two lower beams.

S10.14.2 A system that incorporates any headlamp or beam contributor that does not have a VHAD as an integral and indivisible part of the system must be designed so that the applicable photometric requirements are met when any component is aimed and photometrically conforming headlamp or beam contributor is removed from its mounting and aiming mechanism, and is replaced without realignment by any conforming headlamp or beam contributor of the same type.

S10.14.2.2 A system that incorporates more than one beam contributor providing a lower beam, and/or more than one beam contributor providing an upper beam, shall be designed to conform to the on-vehicle aiming requirements specified in S10.18.8.

S10.14.3 Simultaneous aim. An integral beam headlighting system consisting of four individual headlamps or beam contributors may have the headlamp units mounted in an assembly to permit simultaneous aiming of the beam(s) contributors, providing that with any contributing contributor the assembly completely with all lamps meets the applicable photometric requirements when tested in accordance with S14.2.5.

S10.14.4 Markings. An integral beam headlamp with a single light source providing the lower beam must have its lens permanently marked with "L". An integral beam headlamp with a single light source providing the upper beam must have its lens permanently marked with "U".

S10.14.5 Additional light sources. An integral beam headlamp may incorporate light sources that are used for purposes other than headlighting and are capable of being replaced.

S10.14.6 Photometry. Each integral beam headlamp must be designed to conform to the photometry requirements of Table XVIII for upper beam and Table XIX for lower beam as specified in Table II-c for the specific headlamp unit and aiming method, when tested according to the procedure of S14.2.5.

S10.14.7 Physical tests.

S10.14.7.1 Each integral beam headlamp must be designed to conform to the performance requirements of the corrosion test, temperature cycle test, vibration test, inward force test, headlamp connector test, and aiming adjustment tests of S14.6.

S10.14.7.2 Each integral beam headlamp that is not designed to conform to the performance requirements of the sealing test of S14.6 must be designed to conform to the performance requirements of the connector-corrosion test, dust test, and humidity test of S14.6.

S10.14.7.3 Each integral beam headlamp except those with a glass lens must be designed to conform to the performance requirements of the abrasion test of S14.6.

S10.14.7.4 Each integral beam headlamp except those with a nonreplaceable glass lens must be designed to conform to the performance requirements of the chemical resistance test of S14.6.

S10.14.7.5 Each integral beam headlamp except those with a glass lens and a nonplastic reflector must be designed to conform to the performance requirements of the internal heat test of S14.6.

S10.14.7.6 Each integral beam headlamp incorporating a replaceable lens must be designed to conform to the performance requirements of the chemical resistance of reflectors of replaceable headlamp systems and the corrosion resistance of reflectors of replaceable lens headlamps test of S14.6.

S10.14.7.7 Each integral beam headlamp capable of being mechanically aimed by externally applied headlamp aiming devices must be designed to conform to the performance requirements of the torque deflection test of S14.6.

S10.14.7.8 Each integral beam headlamp must be designed to conform to the performance requirements of the color test of S14.4. Each integral beam headlamp that does not incorporate a glass lens must be designed to conform to the performance requirements of the plastic optical materials test of S14.4.

S10.15 Replaceable bulb headlighting systems. All replaceable bulb headlighting systems must be of a type designated in Table II-d.

S10.15.1 Installation. A replaceable bulb headlighting system must consist of either two or four headlamps as specified for the applicable system in Table II-d. The headlamps must have their beams activated as specified in Table II-d. A system must provide in total not more than two upper beams and two lower beams and must incorporate not more than two replaceable light sources in each headlamp.

S10.15.2 Aiming restrictions. Each replaceable bulb headlamp designed to conform to the external aiming requirements of S10.18.7 must have no mechanism that allows adjustment of an individual light source, or if there are two light sources, independent adjustments of each reflector.

S10.15.3 Replacement lens reflector units. Each lens reflector unit manufactured as replacement equipment must be designed to conform to applicable photometry requirements when any replaceable light source designated for such a unit is inserted in it.

S10.15.4 Markings.
§ 571.108, NI.

A replaceable bulb headlamp in a four headlamp system providing lower beam must have its lens permanently marked with “L”. A replaceable bulb headlamp in a four headlamp system providing upper beam must have its lens permanently marked with “U”.

No such markings are required if the light sources that are used for purposes other than headlighting are any combination of dual filament light sources other than HB2.

Additional light sources. A replaceable bulb headlamp may incorporate replaceable light sources that are used for purposes other than headlighting.

Photometry. Each replaceable bulb headlamp must be designed to conform to the photometry requirements of Table XVIII for upper beam and Table XIX for lower beam as specified in Table II–d for the specific headlamp unit and aiming method, when tested according to the procedure of S14.2.5 using any replaceable light source designated for use in the system under test.

Physical tests.

Each replaceable bulb headlamp must be designed to conform to the performance requirements of the abrasion test of S14.6.

Each replaceable bulb headlamp except those with a glass lens must be designed to conform to the performance requirements of the chemical resistance test of S14.6.

Each replaceable bulb headlamp except those with a nonreplaceable glass lens must be designed to conform to the performance requirements of the plastic optical materials test of S14.4.

Each replaceable bulb headlamp incorporating a replaceable lens must be designed to conform to the performance requirements of the chemical resistance of reflectors of replaceable lens headlamps test and the corrosion resistance of reflectors of replaceable lens headlamps test of S14.6.

Each replaceable bulb headlamp capable of being mechanically aimed by externally applied headlamp aiming devices specified in SAE J602 OCT80, Headlamp Aiming Device for Mechanically Aimmable Sealed Beam Headlamp Units, (incorporated by reference, see 571.108 S5.2 of this title) must be designed to conform to the performance requirements of the torque deflection test of S14.6.

Each replaceable bulb headlamp must be designed to conform to the performance requirements of the color test of S14.4.

§ 571.108, NI.

A combination headlighting system must consist of the correct number of designated headlamp units as specified for the applicable system in Table II–b. The units must have their beams activated as specified in Table II–b. A system must provide in total not more than two upper beams and two lower beams. When installed on a motor vehicle, the headlamps (or parts thereof) that provide the lower beam must be of the same type, and provide a symmetrical effective projected luminous lens area when illuminated.

Each combination headlamp must be designed to conform to the photometry requirements of Table XVIII for upper beam and Table XIX for lower beam as specified in Table II–b for the specific headlamp unit and aiming method, when tested according to the procedure of S14.2.5.

Physical tests.

Any component headlamp of a combination headlighting system that is a Type F sealed beam headlamp must be designed to conform to the performance requirements of S10.13.4.

Any component headlamp of a combination headlighting system that is an integral beam headlamp must be designed to conform to the performance requirements of S10.14.7.

Any component headlamp of a combination headlighting system that is a replaceable bulb headlamp must be designed to conform to the performance requirements of S10.15.7.

Motorcycle headlighting systems. A motorcycle headlighting system may consist of:

(a) One half of any headlighting system of Table II which provides both a full upper beam and full lower beam, and is designed to conform to the requirements for that headlamp type. Where more than one lamp must be used, the lamps shall be mounted vertically, with the lower beam as high as practicable, or

(b) A headlighting system designed to conform to the requirements of paragraphs S10.17.1 through S10.17.5.

Installation. The headlighting system installed on a motorcycle must consist of one of the system types specified in this paragraph, and must be located on the front.

Single headlamp.

If the system consists of a single headlamp, it must be mounted on the vertical centerline of the motorcycle.

If the headlamp contains more than one light source, each light source must
be mounted on the vertical centerline with the upper beam no higher than the lower beam, or horizontally disposed about the vertical centerline and mounted at the same height.

S10.17.1.1.3 If the light sources are horizontally disposed about the vertical centerline, the distance between the closest edges of their effective projected luminous lens areas must not be greater than 200 mm.

S10.17.1.2 Two headlamps with both beams.

S10.17.1.2.1 If the system consists of two headlamps, each of which provides both an upper and lower beam, the headlamps must be mounted either at the same height and symmetrically disposed about the vertical centerline or mounted on the vertical centerline.

S10.17.1.2.2 If the headlamps are horizontally disposed about the vertical centerline, the distance between the closest edges of their effective projected luminous lens areas must not be greater than 200 mm.

S10.17.1.3 Two headlamps, upper beam and lower beam.

S10.17.1.3.1 If the system consists of two headlamps, one of which provides an upper beam and one of which provides the lower beam, the headlamps must be located on the vertical centerline with the upper beam no higher than the lower beam, or horizontally disposed about the vertical centerline and mounted at the same height.

S10.17.1.3.2 If the headlamps are horizontally disposed about the vertical centerline, the distance between the closest edges of their effective projected luminous lens areas must not be greater than 200 mm.

S10.17.2 Motorcycle replaceable bulb headlamp marking. Each replaceable bulb headlamp that is not designed to conform to S10.17(a) must be designed to conform to the photometry requirements of Table XX when tested according to the procedure of S14.2.5.

S10.17.4 Physical tests. Each motorcycle headlamp that is not designed to conform to S10.17(a) must be designed to conform to the performance requirements of the vibration test, moisture test, dust test, and corrosion test of S14.5, the out of focus test of S14.3, the color test of S14.4, and each motorcycle headlamp that does not incorporate a glass lens must be designed to conform to the performance requirements of the plastic optical materials test of S14.4.

S10.17.5 Motorcycle headlamp modulation system. A headlamp on a motorcycle may be activated to modulate either the upper beam or the lower beam from its maximum intensity to a lesser intensity, provided that:

S10.17.5.1 Modulation.

(a) The rate of modulation must be 240 ± 40 cycles per minute.

(b) The headlamp must be operated at maximum power for 50 to 70 percent of each cycle.

(c) The lowest intensity at any test point must be not less than 17 percent of the maximum intensity measured at the same point.

(d) The modulator switch must be wired in the power lead of the beam filament being modulated and not in the ground side of the circuit.

(e) Means must be provided so that both the lower beam and upper beam remain operable in the event of a modulator failure.

(f) The system must include a sensor mounted with the axis of its sensing element perpendicular to a horizontal plane. Headlamp modulation must cease whenever the level of light emitted by a tungsten filament light operating at 3000° Kelvin is either less than 270 lux of direct light for upward pointing sensors or less than 60 lux of reflected light for downward pointing sensors. The light is measured by a silicon cell type light meter that is located at the sensor and pointing in the same direction as the sensor. A Kodak Gray Card (Kodak R–27) is placed at ground level to simulate the road surface in testing downward pointing sensors.

(g) When tested in accordance with the test profile shown in Figure 9, the voltage drop across the modulator when the lamp is on at all test conditions for 12 volt systems and 6 volt systems must not be greater than 0.45 volt. The modulator must meet all the provisions of the standard after completion of the test profile shown in Figure 9.

(h) Means must be provided so that both the lower and upper beam function at design voltage when the headlamp control switch is in either the lower or upper beam position when the modulator is off.

S10.17.5.2 Replacement modulators. Each modulator not intended as original equipment, or its container, must be labeled with the maximum wattage, and the minimum wattage appropriate for its use.

S10.17.5.2.1 Replacement performance. Each modulator, not intended as original equipment, must comply with S10.17.5.1 (a) through (g) when connected to a headlamp of the maximum rated power and a headlamp of the minimum rated power, and must provide means so that the modulated beam functions at design voltage when the modulator is off.

S10.17.5.2.2 Replacement instructions. Instructions, with a diagram, must be provided for mounting the light sensor including location on the motorcycle, distance above the road surface, and orientation with respect to the light.

S10.18 Headlamp aimability performance requirements.
§ 571.108, NHTSA

S10.18.1 Headlamp mounting and aiming. Except as provided in this paragraph, each headlamp must be installed on a motor vehicle with a mounting and aiming mechanism that permits inspection and adjustment of both vertical and horizontal aim, and is accessible for those purposes without removal of any vehicle parts, except for protective covers removable without the use of tools.

S10.18.1.1 The axis of the light beams must be adjustable to the left, right, up, or down from the designed setting, the amount of adjustability to be determined by practical operating conditions and the type of equipment.

S10.18.1.2 The adjustments must be conveniently made by one person with tools ordinarily available. When the headlamps are secured, the aim will not be disturbed under ordinary conditions of service.

S10.18.2 Headlamp aiming systems. When a headlamp system is installed on a motor vehicle, it must be aimable with at least one of the following: An externally applied aiming device, as specified in S10.18.7; an on-vehicle headlamp aiming device installed by the vehicle or lamp manufacturer, as specified in S10.18.8; or by visual/optical means, as specified in S10.18.9.

S10.18.3 Aim adjustment interaction. When installed on the vehicle, adjustment of one aim axis through its full on-vehicle range must not cause the aim of the other axis to deviate more than ±0.76°. If the performance specified is not achievable, the requirements of S10.18.3.1 apply, except that if the aiming mechanism is not a VHAD, the requirements specific to VHADs are not applicable, and the instruction must be specific to the aiming mechanism installed.

S10.18.3.1 Should the mechanism not meet the requirements of S10.18.3, a cautionary label must be placed adjacent to the mechanism stating the caution and including either the reason for the caution or the corrective action necessary. Each such label must also refer the reader to the vehicle operator's manual for complete instructions. Each such vehicle must be equipped with an operator's manual containing the complete instructions appropriate for the mechanism installed.

S10.18.4 Horizontal adjustment-visually aimed headlamp. A visually/optically aimable headlamp that has a lower beam must not have a horizontal adjustment mechanism unless such mechanism meets the requirements of this standard for on vehicle aiming as specified in S10.18.8.

S10.18.5 Optical axis marking.

S10.18.5.1 Optical axis marking-vehicle. Each motor vehicle must be equipped with headlamps or beam contributors which have a mark or markings that are visible from the front of the headlamp when installed on the vehicle to identify the optical axis of the headlamp to assure proper horizontal and vertical alignment of the aiming screen or optical aiming equipment. The manufacturer is free to choose the design of the mark or markings. The mark or markings must be located on the interior or exterior of the lens or indicated by a mark or central structure on the interior or exterior of the headlamp.

S10.18.5.2 Optical axis marking-lamp. Each headlamp or beam contributor that is not visually/optically aimable in accordance with S10.18.9 of this standard must be equipped with fiducial marks, aiming pads, or similar references of sufficient detail and accuracy, for determination of an appropriate vehicle plane to be used with the photometric procedures of S14.2.5 for correct alignment with the photometer axis when being tested for photometric compliance, and to serve for the aiming reference when the headlamp or beam contributor is installed on a motor vehicle. The fiducial marks, aiming pads, or similar references are protrusions, bubble vials, holes, indentations, ridges, scribed lines, or other readily identifiable marks established and described by the vehicle or headlamp manufacturer.

S10.18.5.3 Optical axis marking-visual/optical aim headlamp. There must be a mark or markings identifying the optical axis of the headlamp visible from the front of the headlamp when installed on the vehicle, to assure proper horizontal and vertical alignment of the aiming screen or optical aiming equipment with the headlamp being aimed. The manufacturer is free to choose the design of the mark or markings. The mark or markings may be on the interior or exterior of the lens or indicated by a mark or central structure on the interior or exterior of the headlamp.

S10.18.6 Moveable reflectors. Each headlamp aimed by moving the reflector relative to the lens and headlamp housing, or vice versa, must conform with the photometric requirements applicable to it when tested according to the procedure of S14.2.3 with the lens at any position relative to the reflector within the full range of vertical pitch on the vehicle on which the headlamp system is installed and a horizontal range of ±2.5°. Additionally it must comply with the aiming adjustment requirements of S14.6.

S10.18.7 External aiming. Each headlighting system that is capable of being mechanically aimable using the equipment specified in SAE J602 Headlamp Aiming Device for Mechanically Aimable Sealed Beam Headlamp Units, October 1980, (incorporated by reference, see 571.106 §§5.2 of this title) without the removal of any ornamental trim rings, covers, wipers or other vehicle parts.

S10.18.7.1 Headlamp aiming device locating plates. Each headlighting system which is designed to use the Headlamp Aiming Device...
§ 571.108, N.T.

49 CFR Ch. V (10–1–08 Edition)

Locating Plates with adjustable legs for the 100×165 mm unit and the 142×200 mm unit, and which has adjustable length legs, must meet the following requirements:

S10.18.7.1.1 The lens must have three aiming pads which meet the requirements of Figure 4, Dimensional Specifications for Location of Aiming Pads on Replaceable Bulb Headlamp Units. The primary plane and the secondary plane need not be at 90° relative to each respective aiming pad on the lens. The height of these numbers must be not less than 0.01 in (0.25 mm). The height of these numbers must be not less than 0.01 in (0.25 mm). The dimensions may be placed anywhere on the lens, the whole number represents the distance to a primary plane (Dimension F in Figure 4) must be followed by the letter “H” and the dimension for the center aiming pad must be followed by the letter “V.” The dimensions must be expressed in tenths of an inch (i.e. 0.3 inch = 3) from the aiming reference plane to the respective aiming pads which are not in contact with that plane, must be inscribed adjacent to each respective aiming pad on the lens. The height of these numbers must be not less than 0.17 in (4 mm). If there is interference between the plane and the area of the lens between the aiming pads, the whole number represents the distance to a secondary plane. The secondary plane must be located parallel to the aiming reference plane and as close to the lens as possible without causing interference.

S10.18.7.1.2 If the most forward aiming pad is the lower inboard aiming pad, then the dimensions may be placed anywhere on the lens. The dimension for the outboard aiming pad (Dimension F in Figure 4) must be followed by the letter “V” and the dimension for the center aiming pad must be followed by the letter “V.” The dimensions must be expressed in tenths of an inch.

S10.18.7.2 Nonadjustable headlamp aiming device locating plates. Each headlamp may be designed to use the nonadjustable Headlamp Aiming Device Locating Plate for the 100×165 mm unit, the 142×200 mm unit, the 146 mm diameter unit, or the 178 mm diameter unit of SAE J802 OctBl, Headlamp Aiming Device for Mechanically Aimable Sealed Beam Headlamp Units, (incorporated by reference, see 571.108 ¶5.2 of this title), or the 92×150 mm Type F unit, and incorporate lens-mounted aiming pads as specified for those units pursuant to Appendix C of part 564 of this chapter. If so designed, no additional lens marking is necessary to designate the type of plate or dimensions.

S10.18.8 On-vehicle aiming. Each headlighting system that is capable of being aimed by equipment installed on the vehicle must include a Vehicle Headlamp Aiming Device (VHAD) that conforms to the following requirements:

S10.18.8.1 Aim. The VHAD must provide for headlamp aim inspection and adjustment in both the vertical and horizontal axes.

S10.18.8.1.1 Vertical aim. The VHAD must include the necessary references and scales relative to the horizontal plane to assure correct vertical aim for photometry and aiming purposes. An off vehicle measurement of the angle of the plane of the ground is permitted. In addition, an equal number of graduations from the “0” position representing angular changes in the axis in the upward and downward directions must be provided.

S10.18.8.1.1.1 Each graduation must represent a change in the vertical position of the mechanical axis not larger than 0.19° (1 in at 25 ft) to provide for variations in aim at least 1.2° above and below the horizontal, and have an accuracy relative to the zero mark of less than 0.1°.

S10.18.8.1.1.2 The VHAD must be marked to indicate headlamp aim movement in the upward and downward directions.

S10.18.8.1.1.3 Each graduation must indicate a linear movement of the scale indicator of not less than 0.05 in (1.27 mm) if a direct reading analog indicator is used. If a remote reading indicator is provided, it must represent the actual aim movement in a clear, understandable format.

S10.18.8.1.1.4 The vertical indicator must perform through a minimum range of ±1.2°.

S10.18.8.1.1.5 Means must be provided in the VHAD for compensating for deviations in floor slope less than 1.2° from the horizontal that would affect the correct positioning of the headlamp for vertical aim.

S10.18.8.1.1.6 The graduations must be legible under an illumination level not greater than 30 foot candles, measured at the top of the graduation, by an observer having 20/20 vision (Snellen), and must permit aim adjustment to within 0.19° (1 in at 25 ft).

S10.18.8.1.2 Horizontal aim. The VHAD must include references and scales relative to the longitudinal axis of the vehicle necessary to assure correct horizontal aim for photometry and aiming purposes. An “0” mark must be used to indicate alignment of the headlamps relative to the longitudinal axis of the vehicle. In addition, an equal number of graduations from the “0” position representing equal angular changes in the axis relative to the vehicle axis must be provided.

S10.18.8.1.2.1 Each graduation must represent a change in the horizontal position of the mechanical axis not greater than 0.38° (2 in at 25 ft) to provide for variations in aim at least 0.76° (4 in at 25 ft) to the left and right of the longitudinal axis of the vehicle, and must have an accuracy relative to the zero mark of less than 0.1°.

S10.18.8.1.2.2 The VHAD must be marked to indicate headlamp aim movement in the left and right directions.

S10.18.8.1.2.3 The graduations must be legible under an illumination level not greater than 30 foot candles, measured at the top of the graduation, by an observer having 20/20 vision (Snellen), and must permit aim adjustment to within 0.38° (2 in at 25 ft).

S10.18.8.1.2.4 The horizontal indicator must perform through a minimum range of ±0.76° (4 in at 25 ft), however, the indicator itself must be capable of recalibration over a
movement of 2.5° relative to the longitudinal axis of the vehicle to accommodate any adjustment necessary for recalibrating the indicator after vehicle repair from accident damage.

S10.18.8.2 Aiming instructions.
S10.18.8.2.1 The instructions for properly aiming the headlighting system using the VHAD must be provided on a label permanently affixed to the vehicle adjacent to the VHAD, or in the vehicle operator’s manual. The instructions must advise that the headlighting system is properly aimed if the appropriate vertical plane (as defined by the vehicle manufacturer) is perpendicular to both the longitudinal axis of the vehicle, and a horizontal plane when the vehicle is on a horizontal surface, and the VHAD is set at “0°” vertical and “0°” horizontal.

S10.18.8.2.2 Should a remote indicator or a remote indicator and adjuster be provided, the instructions must be placed in the operator’s manual, and may also be placed on a label adjacent to the VHAD.

S10.18.8.3 Permanent calibration. Each headlamp equipped with a VHAD must be manufactured with its calibration permanently fixed by its manufacturer. Calibration in this case means the process of accurately aligning the geometry of the VHAD devices with the beam pattern for the purposes of compliance with the standard.

S10.18.8.4 Replacement units. When tested according to the procedure of S14.2.5 with any replacement headlamp unit(s) or light sources intended for use in the system under test, the VHAD and headlighting system must be designed to conform to the photometric performance requirements applicable for the system under test.

S10.18.8.5 Physical tests. Each VHAD must be designed to conform with the performance requirements of S14.8.

S10.18.9 Visual/optical aiming. Each visually/optically aimable headlamp must be designed to conform to the following requirements.

S10.18.9.1 Vertical aim, lower beam. Each lower beam headlamp must have a cutoff in the beam pattern. It may be either on the left side or the right side of the optical axis, but once chosen for a particular headlamp system’s design, the side chosen for the cutoff must not be changed for any headlamps intended to be used as replacements for those system’s headlamps.

S10.18.9.1.1 Vertical position of the cutoff. The headlamp must be aimed vertically so that the cutoff is on the left side, at 0.4° down from the H–H line, or on the right side, at the H–H line.

S10.18.9.1.2 Vertical gradient. The gradient of the cutoff measured at either 2.5° L or 2.0° R must not be less than 0.13 based on the procedure of S10.18.9.1.5.

S10.18.9.1.3 Horizontal position of the cutoff. The width must be not less than 2°, with not less than 2° of its actual width centered at either 2.5° L, or 2.0° R.

S10.18.9.1.4 Maximum inclination of the cutoff. The vertical location of the highest gradient at the ends of the minimum width must be within ±0.2° of the vertical location of the maximum gradient measured at the appropriate vertical line (at either 2.5° L for left side cutoff, or 2.0° R for a right side cutoff).

S10.18.9.1.5 Measuring the cutoff parameter. S10.18.9.1.5.1 The headlamp is mounted on a headlamp test fixture which simulates its actual design location on any vehicle for which the headlamp is intended. The fixture, with the headlamp installed, is attached to the goniometer table in such a way that the fixture alignment axes are coincident with the goniometer axes. The headlamp is energized at the specified test voltage. The cutoff parameter must be measured at a distance of 10 m from a photosensor with a 10 mm diameter.

S10.18.9.1.5.2 If the headlamp has a VHAD, it is set to zero.

S10.18.9.1.5.3 A vertical scan of the beam pattern is conducted for a headlamp with a left side gradient by aligning the goniometer on a vertical line at 2.5° L and scanning from 1.5° U to 1.5° D. For a headlamp with a right side gradient, a vertical scan of the beam pattern is conducted by aligning the goniometer on a vertical line at 2.0° R and scanning from 1.5° U to 1.5° D.

S10.18.9.1.5.4 Determine the maximum gradient within the range of the scan by using the formula: \[ G = \log E(a) - \log E(a + 0.1) \], where “G” is the gradient, “E” is illumination and “a” is vertical angular position. The maximum value of the gradient “G” determines the vertical angular location of the cutoff. Perform vertical scans at 1.0° L and R of the measurement point of the maximum gradient to determine the inclination.

S10.18.9.2 Horizontal aim, upper beam. There is no adjustment of horizontal aim unless the headlamp is equipped with a horizontal VHAD. If the headlamp has a VHAD, it is set to zero.

S10.18.9.3 Vertical aim, upper beam.

S10.18.9.3.1 If the upper beam is combined in a headlamp with a lower beam, the vertical aim of the upper beam must not be changed from the aim set using the procedures of S10.18.9.1 and S10.18.9.2 used for the lower beam.

S10.18.9.3.2 If the upper beam is not combined in a headlamp with a lower beam, the vertical aim of the upper beam is adjusted so that the maximum beam intensity is located on the H–H axis.

S10.18.9.4 Horizontal aim, upper beam.
S10.18.9.4.1 If the upper beam is combined in a headlamp with a lower beam, the horizontal aim of the upper beam must not be changed from the aim set using the procedures of S10.18.9.1 and S10.18.9.2 used for the lower beam.

S10.18.9.4.2 If the upper beam is not combined in a headlamp with the lower beam and has fixed horizontal aim or has a horizontal VHAD, then the headlamp is mounted on a headlamp test fixture which simulates its actual design location on any vehicle for which the headlamp is intended. The fixture, with the headlamp installed, is attached to the goniometer table in such a way that the fixture alignment axes are coincident with the goniometer axes. The headlamp must be energized at 12.8 ± 0.20 mV. There is no adjustment, shrinking, or modification of the horizontal axis of the headlamp or test fixture, unless the headlamp is equipped with a VHAD. In this case the VHAD is adjusted to zero.

S10.18.9.4.3 If the upper beam is not combined in a headlamp with a lower beam, and it does not have a VHAD, the horizontal aim of the upper beam is adjusted so that the maximum beam intensity is located on the V–V axis.

S10.18.9.5 Photometry. When tested according to the procedure of S14.2.5, a visually/optically aimable headlamp must be designed to conform to the lower beam requirements of columns; LB1V or LB2V of Table XIX–a, or LB3V of Table XIX–b, or LB4V of Table XIX–c.

S10.18.9.6 Visual/optical aiming identification marking. Each letter used in marking according to this paragraph must be not less than 3 mm high.

S10.18.9.6.1 The lens of a lower beam headlamp must be marked “VOL” if the headlamp is intended to be visually/optically aimed using the left side of the lower beam pattern. The lens of a lower beam headlamp must be marked “VOR” if the headlamp is intended to be visually/optically aimed using the right side of the lower beam pattern. The lens of a headlamp that is solely an upper beam headlamp and intended to be visually/optically aimed using the upper beam must be marked “VO”.

S10.18.9.6.2 The lens of each sealed beam or integral beam headlamp must be marked “VOR” if the headlamp is of a type that was manufactured before May 1, 1997, and if such headlamp type has been redesigned since then to be visually/optically aimable.

S11 Replaceable light source requirements. Each replaceable light source must be designed to conform to the dimensions and electrical specifications furnished with respect to it pursuant to part 564 of this chapter, on file in Docket No. NHTSA 98–3397, and must conform to the following requirements:

§ 571.108, NT.

49 CFR Ch. V (10–1–08 Edition)
§ 571.108, NI.

the headlamps illuminated by actuation of a single switch, lever, or similar mechanism, including a mechanism that is automatically actuated by a change in ambient light conditions.

S12.4 Each headlamp concealment device must be installed so that the headlamp may be mounted, aimed, and adjusted without removing any components of the headlamp assembly.

S12.5 Except for cases of malfunction covered by S12.2, each headlamp concealment device must, within an ambient temperature range of −20 °F to +120 °F, be capable of being fully opened in not more than 3 seconds after the actuation of a driver-operated control.

S12.6 As an alternative to complying with the requirements of S12.1 through S12.5, a vehicle with headlamps incorporating VHAD or visual/optical aiming in accordance with this standard may meet the requirements for Concealable lamps in paragraph 5.14 of the following version of the Economic Commission for Europe Regulation 48 “Uniform Provisions Concerning the Approval of Vehicles With Regard to the Installation of Lighting and Light-Signaling Devices”: E/ECE/TRANS/505, Rev.1/Add.4/Rev.1/Corr.2, 26 February 1996 (page 17) (incorporated by reference, see 571.108 S5.2 of this title), in the English language version.

S12.7 Certification election. Manufacturers of vehicles with headlamps incorporating VHAD or visual/optical aiming in accordance with this standard must elect to certify to S12.1 through S12.5 or to S12.6 prior to, or at the time of certification of the vehicle, pursuant to 49 CFR Part 567. The selection is irrevocable.

S13 Replaceable headlamp lens requirements.

S13.1 A replacement lens for a replaceable bulb headlamp or integral beam headlamp that is not required to have a bonded lens must be provided with a replacement seal in a package that includes instructions for the removal and replacement of the lens, the cleaning of the reflector, and the sealing of the replacement lens to the reflector assembly.

S13.2 Each replacement headlamp lens must be marked according to the lens manufacturer’s instructions on an integral beam or replaceable bulb headlamp, must not be the headlamp to fail to comply with any of the requirements of this standard.

S13.3 Each replacement headlamp lens must be marked with the symbol “DOT” either horizontally or vertically, to constitute certification. Each replacement headlamp lens must also be marked with manufacturer and the part or trade number of the headlamp for which it is intended, and with the name and/or trademark of the lens manufacturer or importer that is registered with the U.S. Patent and Trademark Office. Nothing in this standard authorizes the marking of any such name and/or trademark by one who is not the owner, unless the owner has consented to it.

S14 Physical and photometry test procedures and performance requirements.

S14.1 General test procedures and performance requirements.

S14.1.1 Each lamp, reflective device, item of conspicuity treatment, and item of associated equipment required or permitted by this standard must be designed to conform to all applicable physical test performance requirements specified for it.

S14.1.2 Plastic optical materials. All plastic materials used for optical parts such as lenses and reflectors on lamps or reflective devices required or allowed by this standard must conform to the material test requirements of S14.4.2.

S14.1.3 All coatings used on optical materials must have added to their formulations an optical brightener, whose presence is detectable by ultraviolet light, to aid in testing for their presence. Other equivalent industry accepted methods may be used as an alternative.

S14.1.4 Samples.

S14.1.4.1 Samples submitted for laboratory test must be new, unused, manufactured from production tooling and assembled by production processes, and representative of the devices as regularly manufactured and marketed.

S14.1.4.2 Each test sample must include not only the device but also accessory equipment necessary to operate in its intended manner. Where necessary a mounting bracket shall be provided so that the device may be rigidly bolted in its operating position on the various test equipment.

S14.1.4.3 Dust and photometric tests may be made on a second set of mounted samples, if desired, to expedite completion of the tests.

S14.1.5 Laboratory facilities. The laboratory must be equipped to test the sample in accordance with the requirements of the specific device.

S14.2 Photometric test procedures. Each reperfective device required or permitted by this standard must be designed to conform to the applicable photometric requirements.

S14.2.1 Photometry measurements for all lamps except license plate lamps, headlamps, and DRLs.

S14.2.1.1 Mounting. Photometry measurements are made with the sample lamp mounted in its normal operating position.

S14.2.1.2 School bus signal lamp aiming. A school bus signal lamp must be aligned with its aiming plane normal to the photometer axis and may be realigned for photometry by ± ½° vertically and ± 1° horizontally.

S14.2.1.3 Measurement distance. Photometric measurements are made at a distance between the light source and the point of...
measurement of at least 1.2 m for side marker lamps, clearance lamps, identification lamps, and parking lamps, and at least 3 m for turn signal lamps, stop lamps, taillamps, backup lamps, and school bus signal lamps.

§ 571.108, N1.

Each lamp designed to use a type of bulb that has not been assigned a mean spherical candela rating by its manufacturer and is not listed in SAE J573d, Lamp Bulbs and Sealed Units, December 1968 (incorporated by reference, see § 571.108 S5.2 of this title), must meet the applicable requirements of this standard when used with any bulb of the type specified by the lamp manufacturer, operated at the bulb's design voltage. A lamp that contains a sealed-in bulb must meet these requirements with the bulb operated at the bulb's design voltage.

S14.2.1.6.1 Each lamp designed to use a type of bulb that has not been assigned a mean spherical candela rating by its manufacturer and is not listed in SAE J573d, Lamp Bulbs and Sealed Units, December 1968 (incorporated by reference, see § 571.108 S5.2 of this title), must meet the applicable requirements of this standard when used with any bulb of the type specified by the lamp manufacturer, operated at the bulb's design voltage. A lamp that contains a sealed-in bulb must meet these requirements with the bulb operated at the bulb's design voltage.

S14.2.1.6.2 A bulb that is not listed in SAE J573d, Lamp Bulbs and Sealed Units, December 1968, (incorporated by reference, see § 571.108 S5.2 of this title) is not required to use a socket that conforms to the requirements of SAE J567b, Bulb Sockets, April 1964 (incorporated by reference, see § 571.108 S5.2 of this title).

S14.2.2 License plate lamp photometry. Photometry compliance of license plate lamps is determined by measurement of the illumination falling upon test stations located on a test plate.

S14.2.2.1 Illumination surface. All illumination measurements are made on a rectangular test plate of clean, white blotting paper mounted on the license plate holder in the position normally taken by the license plate. The face of the test plate must be 1.5 mm from the face of the license plate holder.

S14.2.2.2 Test stations. Test stations must be located on the face of the test plate as shown in Figure 19 according to the type of vehicle on which the license plate lamps are installed.

S14.2.2.3 Bulb requirements of S14.2.1.6 apply to license plate lamp photometry.

S14.2.3 Reflex reflector and retroreflective sheeting photometry.

S14.2.3.1 Mounting. Each reflex reflector is mounted for photometry with the center of the reflex area at the center of goniometer rotation and at the same horizontal level as the source of illumination.

S14.2.3.2 Illumination source. The source of illumination is a lamp with a 50 mm effective diameter and with a filament operating at 2856 °K.

S14.2.3.3 Measurement distance. The test distance is 30.5 m [100 ft].

S14.2.3.4 Test setup. The observation point is located directly above the source of illumination. The H-V axis of reflex reflectors is taken as parallel to the longitudinal axis of the vehicle for rear reflectors and perpendicular to a vertical plane passing through the longitudinal axis of the vehicle for side reflectors.

S14.2.3.5 Photodetector. The photodetector has an opening of not more than 15 mm vertically and 25 mm horizontally.
§ 571.108, NI.

S14.2.3.6 Photometry surface. Reflex reflectors may have any linear or area dimensions but must have no more than 7740 sq mm projected area contained within a 254 mm diameter circle exposed for photometry.

S14.2.3.7 Procedure. Photometric measurements of reflex reflectors and retroreflective sheeting must be made at various observation and entrance angles as shown in Table XVI.

S14.2.3.7.1 The observation angle is the angle formed by a line from the observation point to the center of the reflector and a second line from the center of the reflector to the source of illumination.

S14.2.3.7.2 The entrance angle is the angle between the axis of the reflex reflector and a line from the center of the reflector to the source of illumination.

S14.2.3.7.3 The entrance angle is designated left, right, up, and down in accordance with the position of the source of illumination with respect to the axis of the reflex reflector as viewed from behind the reflector.

S14.2.3.7.4 Measurements are made of the luminous intensity which the reflex reflector is projecting toward the observation point and the illumination on the reflex reflector from the source of illumination.

S14.2.3.8 Measurements.

S14.2.3.8.1 Reflex reflectors. The required measurement for reflex reflectors at each test point as shown in Table XVI is the quotient of the projected luminous intensity divided by the illumination expressed as milllicandela per lux or candela per foot-candle.

S14.2.3.8.2 Retroreflective sheeting. The required measurement for retroreflective sheeting reflectors at each test point as shown in Table XVI is candela per lux per square meter of area.

S14.2.3.8.3 Reflex reflector photometry measurement adjustments.

S14.2.3.8.3.1 Reflex reflectors, which do not have a fixed rotational position on the vehicle, are rotated about their axis through 360° to find the minimum photometric value which must be reported for each test point.

S14.2.3.8.3.2 Reflex reflectors, which by their design or construction, permit mounting on a vehicle in a fixed rotational position, are tested in this position. A visual locator, such as the word 'TOP' is not considered adequate to establish a fixed rotational position on the vehicle.

S14.2.3.8.3.3 If uncolored reflections from the front surface interfere with photometric readings at any test point, additional readings are taken 1° above, below, right, and left of the test point, and the lowest of these readings and its location is reported provided the minimum test point requirement for the test point is met.

S14.2.4 Daytime running lamp (DRL) photometry measurements.

S14.2.4.1 Each DRL is tested to the procedure of S14.2.5 when a test voltage of 12.6 ± 20 mv is applied to the input terminals of the lamp switch module or voltage-reducing equipment, whichever is closer to the electrical source on the vehicle.

S14.2.4.2 The test distance from the lamp to the photometer is not less than 18.3 m if the lamp is optically combined with a headlamp, or is a separate lamp, and not less than 3 m if the lamp is optically combined with a lamp, other than a headlamp, that is required by this standard.

S14.2.4.3 Bulb requirements of S14.2.1.6 apply to DRL photometry.

S14.2.5 Headlamp photometry measurements.

S14.2.5.1 Mounting. Photometry measurements at the applicable test points are made with the sample headlamp mounted in its normal operating position.

S14.2.5.2 Test points in the area from 10° to 90° U must be measured from the normally exposed surface of the lens face.

S14.2.5.3 Measurement distance. Photometric measurements are made at a distance between the light source and the photometer sensor of at least 18.3 m.

S14.2.5.4 Seasoning and test voltage. All sealed beam headlamps, integral beam headlamps, beam contributors, and replaceable light sources are seasoned at design voltage for 1% of its average design life or 10 hours, whichever is less prior to a photometry test. A headlamp is tested at 12.8 ± 20 mv, D.C. as measured at the terminals of the lamp.

S14.2.5.5 Aiming. Each headlamp is aimed prior to a photometry test in accordance with the procedure appropriate to its aiming system. A ± 1°C realm is permitted in any direction at any test point to allow for variations in readings between laboratories for all headlamps except a Type F upper beam unit not equipped with a VHAD.

S14.2.5.5.1 Mechanically aimable headlamps using an external aimer. The headlamp is aimed mechanically with the aiming plane at the design angle(s) to the photometer axis and the mechanical axis of the headlamp on the photometer axis.

S14.2.5.5.2 Mechanically aimable headlamps equipped with a VHAD. The headlamp is aimed mechanically using the VHAD in accordance with the manufacturer's instructions as provided with the vehicle on which the headlamp is intended to be used.

S14.2.5.5.3 Visually aimable lower beam headlamps-vertical aim.

S14.2.5.5.3.1 A VOL cutoff headlamp must have the location of the cutoff maximum gradient, as determined by the method of
§571.108, N.I.

this standard, positioned at 0.4° down from the H–H line.

S14.2.5.3.2 A VOR cutoff headlamp must have the location of the cutoff maximum guaranteed, as determined by the method of this standard, positioned at the H–H line.

S14.2.5.5.4 Visually aimable lower beam headlamps-horizontal aim. There must be no adjustment of horizontal aim unless the headlamp is equipped with a horizontal VHAD. If the headlamp has a VHAD, it must be set to zero.

S14.2.5.5.5 Visually aimable upper beam headlamps-vertical aim.

S14.2.5.5.5.1 A headlamp whose upper beam is combined with a lower beam must not have its vertical aim changed from that set for the lower beam.

S14.2.5.5.5.2 A headlamp whose upper beam is not combined with a lower beam must have its maximum beam intensity positioned on the H–H axis.

S14.2.5.5.6 Visually aimable upper beam headlamps-horizontal aim.

S14.2.5.5.6.1 A headlamp whose upper beam is combined with a lower beam must not have its horizontal aim changed from that set for the lower beam.

S14.2.5.5.6.2 A headlamp whose upper beam is not combined with a lower beam and has a fixed horizontal aim or has a horizontal VHAD must be mounted in its normal operating position on a goniometer such that the mounting fixture alignment axes are coincident with the goniometer axes and must be energized at 12.8 ± 20 mv. There must be no adjustment, shimming, or modification of the horizontal axis of the headlamp or test fixture, unless the headlamp is equipped with a VHAD, in which case the VHAD must be adjusted to zero.

S14.2.5.5.6.3 A headlamp whose upper beam is not combined with a lower beam and is not equipped with a horizontal VHAD, the horizontal aim must be adjusted so that the maximum beam intensity is positioned on the V–V axis.

S14.2.5.5.7 Simultaneous aim Type F sealed beam headlamps and beam contributor integral beam headlamps.

S14.2.5.5.7.1 A headlamp system permitted to use simultaneous aim of lower beams and upper beams must be aimed mechanically for lower beam photometry by centering the lower beam unit or the geometric center of all lower beam contributors on the photometer axis and aligning the aiming plane, aiming reference plane, or other appropriate vertical plane defined by the manufacturer perpendicular to the photometer axis.

S14.2.5.5.7.2 The headlamp must be aimed for upper beam photometry by moving the assembly in a plane parallel to the established lower beam aiming plane until the upper beam unit or the geometric center of all upper beam contributors is centered in the photometric axis.

S14.2.5.5.8 Motorcycle headlamp-upper beam headlamps designed to comply with Table XX. The upper beam of a multiple beam headlamp designed to comply with the requirements of Table XX must be aimed photoelectrically so that the center of the zone of highest intensity falls 0.4° vertically below the lamp axis and is centered laterally. The center of the zone of highest intensity must be established by the intersection of a horizontal plane passing through the point of maximum intensity, and the vertical plane established by balancing the photometric values at 3' L and 3' R.

S14.2.5.5.9 Motorcycle headlamp-lower beam headlamps designed to comply with Table XX. The beam from a single beam headlamp designed to comply with the requirements of Table XX must be aimed straight ahead with the top of the beam aimed vertically to obtain 2000 cd at H–V.

S14.2.5.6 Positioner. The goniometer configuration, used to position the sample headlamp when making photometric measurements at specific angular test points, is horizontal rotation over elevation. The vertical axis of the goniometer must correspond to the design position vertical axis of the sample headlamp which is vertical and perpendicular to the longitudinal axis of the vehicle.

S14.2.5.7 Photometer.

S14.2.5.7.1 The photometer must be capable of measuring the luminous intensity of the sample headlamp throughout its illumination range.

S14.2.5.7.2 Sensor.

S14.2.5.7.2.1 The maximum effective area of the photometric sensor must fit within a circle whose diameter is equal to 0.009 times the actual test distance from the light source of the sample headlamp to the sensor.

S14.2.5.7.2.2 The sensor effective area is defined as the actual area of intercepted light striking the detector surface of the photometer. Sensor systems incorporating lenses that change the diameter of the intercepted light beam before it reaches the actual detector surface, the maximum size requirements must apply to the total area of the light actually intercepted by the lens surface.

S14.2.5.7.2.3 The sensor must be capable of intercepting all direct illumination from the largest illuminated dimension of the sample lamp at the test distance.

S14.2.5.7.3 The color response of the photometer must be corrected to that of the 1931 International Commission on Illumination (C.I.E.) Standard Observer (2-degree) Photopic Response Curve, as shown in the C.I.E. 1931 Chromaticity Diagram (incorporated by reference, see 571.108 S5.2 of this title).

S14.2.5.8 Location of test points.
S14.2.5.8.1 Test point positions are defined by the positioner. The following nomenclature applies:
S14.2.5.8.1.1 The letters “V” and “H” designate the vertical and horizontal planes intersecting both the headlamp light source and the photometer axis. “H–V” designates the zero test point angle at the intersection of the H and V planes. This intersection is parallel to the longitudinal axis of the vehicle.
S14.2.5.8.1.2 The letters “U”, “D”, “L”, and “R”, indicating up, down, left and right, respectively, designate the angular position from the H and V planes to the photometer as viewed from the headlamp.
S14.2.5.8.1.3 Horizontal angles designated L and R are defined as the plan view angle between the vertical plane and the projection of the light ray from the headlamp onto the horizontal plane.
S14.2.5.8.1.4 Vertical angles designated U and D are defined as the true angle between the horizontal plane and the light ray from the headlamp.

S14.2.5.9 Beam contributor photometry measurements. In a headlighting system where there is more than one beam contributor providing a lower beam, and/or more than one beam contributor providing an upper beam, each beam contributor must be designed to meet only the applicable photometric performance requirements based upon the following mathematical expression: conforming test point value = 2(test point value) + total number of lower or upper beam contributors for the vehicle, as appropriate.

S14.2.5.10 Moveable reflector aimed headlamp photometry measurements.

S14.2.5.10.1 A headlamp aimed by moving the reflector relative to the lens and headlamp housing, or vice versa, must conform to the photometry requirements applicable to it with the lens at any position relative to the reflector.

S14.2.5.10.2 These positions include not less than the full range of vertical pitch of the vehicle on which the headlamp is installed and not less than ±2.5° from the nominal horizontal aim position for the vehicle on which the headlamp is installed unless the headlamp is visually/optically aimed with a fixed horizontal aim.

S14.3 Motorcycle headlamp out of focus test procedure and performance requirements.

S14.3.1 Procedure. The sample device must be tested for photometry using bulbs having each of four out-of-focus filament positions. Where conventional bulbs with two pin bayonet bases are used, tests must be made with the light source 0.060 in above, below, ahead, and behind the designated position. If prefocused bulbs are used, the limiting positions at which tests are made must be 0.020 in above, below, ahead, and behind the designated position. The sample device may be re-aimed for each of the out-of-focus positions of the light source.

S14.3.2 Performance requirements. The minimum photometric values for the out-of-design position must be 80% of the in-design position.

S14.4 General test procedures and performance requirements.

S14.4.1 Color test. The requirement applies to the overall effective color of light emitted by the device and not to the color of the light from a small area of the lens. It does not apply to any pilot, indicator, or tell-tale lights. The color of the sample device must comply when tested by either the Visual Method or the Tristimulus Method.

S14.4.1.1 Samples. A test sample for a reflex reflector may be either the reflex reflector or a disc of the same material, technique of fabrication, and dye formulation as the reflex reflector. If a disc is used, the thickness must be twice the thickness of the reflector as measured from the face of the lens to the apexes of the reflecting elements.

S14.4.1.2 General procedure.

S14.4.1.2.1 The device must be operated at design voltage.

S14.4.1.2.2 Components (bulbs, caps, lenses, and the like) must be tested in a fixture or manner simulating the intended application.

S14.4.1.2.3 The lamp shall be allowed to reach operating temperature before measurements are made.

S14.4.1.2.4 The entire light emitting surface of the sample must be visible from any point on the entrance window of the test instrument.

S14.4.1.2.5 The distance between the test instrument and the sample must be large enough so that further increases in distance will not affect the results.

S14.4.1.3 Visual method.

S14.4.1.3.1 Visual method procedure. The color of light from the sample device must be compared visually with the color of the light from a standard. The standard may consist of a filter or limit glass. In the case of white, CIE Source A is used only as a color reference. The chromaticity coordinates of the color standards must be as close as possible to the limits listed. The color of the standard filters is determined spectrophotometrically.

S14.4.1.3.2 Visual method performance requirements. The color must comply with the applicable requirement.

S14.4.1.3.2.1 Red. Red is not acceptable if it is less saturated (paler), yellower, or bluer than the limit standards.

S14.4.1.3.2.2 Yellow (Amber). Yellow is not acceptable if it is less saturated (paler), greenish, or redder than the limit standards.

S14.4.1.3.2.3 White. White is not acceptable if its color differs materially from that of CIE Source A.

S14.4.1.4 Tristimulus method.
§571.108, Nt.

S14.4.1.4.1 Tristimulus method procedure.
S14.4.1.4.1.1 The color of light from the H–V point of a sample device must be measured by photoelectric receivers with spectral responses that approximate CIE standard spectral tristimulus valves.
S14.4.1.4.1.2 A sphere may be used to integrate light from a colored source provided that the color shift that results from the spectral selectivity of the sphere paint be corrected by the use of a filter, correction factor, or an appropriate calibration.
S14.4.1.4.1.3 The sample device does not have uniform spectral characteristics in all useful directions, color measurements must be made at as many directions of view as are practicable to evaluate the color for those directions that apply to the end use of the device.
S14.4.1.4.2 Tristimulus method performance requirements. The color must comply with the applicable requirement.
S14.4.1.4.2.1 Red. The color of light emitted must fall within the following boundaries:
y = 0.33 (yellow boundary)
y = 0.98 – x (purple boundary)
S14.4.1.4.2.2 Yellow (Amber). The color of light emitted must fall within the following boundaries:
y = 0.79 – 0.67x (white boundary)
y = x – 0.12 (green boundary)
S14.4.1.4.2.3 White (achromatic). The color of light emitted must fall within the following boundaries:
x = 0.31 (blue boundary)
y = 0.44 (green boundary)
x = 0.50 (yellow boundary)
y = 0.15 + 0.65x (green boundary)
y = 0.38 (red boundary)
y = 0.05 + 0.75x (purple boundary)
S14.4.2 Plastic optical materials tests. Accelerated weathering procedures are not permitted.
S14.4.2.1 Samples.
S14.4.2.1.1 Samples of materials shall be injection molded into polished metal molds to produce test specimens with two flat and parallel faces. Alternative techniques may be used to produce equivalent specimens.
S14.4.2.1.2 Test specimens shape may vary, but each exposed surface must contain a minimum uninterrupted area of 32 sq cm.
S14.4.2.1.3 Samples must be furnished in thicknesses of 1.6 ± 0.25 mm, 2.3 ± 0.25 mm, 3.2 ± 0.25 mm, and 6.4 ± 0.25 mm.
S14.4.2.1.4 All samples must conform to the applicable color test requirement of this standard prior to testing.
S14.4.2.1.5 A control sample, kept properly protected from influences which may change its appearance and properties of each thickness, must be retained.
S14.4.2.2 Outdoor exposure test.

S14.4.2.2.1 Outdoor exposure tests of 3 years in duration must be made on samples of all materials, including coated and uncoated versions, used for optical parts of devices covered by this standard. Tests are to be conducted in Florida and Arizona.
S14.4.2.2.2 Concentrations of polymer components and additives used in plastic materials may be changed without outdoor exposure testing provided the changes are within the limits of composition represented by higher and lower concentrations of these polymer components and additives previously tested to this section and found to meet its requirements.
S14.4.2.2.3 Procedure.
S14.4.2.2.3.1 One sample of each thickness of each material must be mounted at each exposure site so that at least a minimum uninterrupted area of 32 sq cm of the exposed upper surface of the sample is at an angle of 45° to the horizontal facing south. The sample must be mounted in the open no closer than 30 cm (11.8 in) to its background.
S14.4.2.2.3.2 During the exposure time the samples must be cleaned once every three months by washing with mild soap or detergent and water, and then rinsing with distilled water. Rubbing must be avoided.
S14.4.2.2.4 Performance requirements. Plastic lenses, other than those incorporating reflex reflectors, used for inner lenses or those covered by another material and not exposed directly to sunlight must meet the optical material test requirements when covered by the outer lens or other material.
S14.4.2.2.4.1 After completion of the outdoor exposure test the haze and loss of surface luster as measured by ASTM 1003–92, Haze and Luminous Transmittance of Transparent Plastic, (incorporated by reference, see 571.108 S5.2 of this title) must not be greater than:
(a) 30% for materials used for outer lenses, other than those incorporating reflex reflectors;
(b) 7% for materials used for reflex reflectors and lenses used in front of reflex reflectors.
S14.4.2.2.4.2 After completion of the outdoor exposure test all materials, when compared with the unexposed control samples, must not show physical changes affecting performance such as color bleeding, delamination, crazing, or cracking. Additionally materials used for reflex reflectors and lenses used in front of reflex reflectors must not show surface deterioration or dimensional changes.
S14.4.2.2.4.3 After completion of the outdoor exposure test all materials, when compared with the unexposed control samples, must not have their luminous transmittance
changed by more than 25% when tested in accordance with ASTM E 308-66 (1973), *Spectrophotometry and Description of Color in CIE 1931 System* (incorporated by reference, see §571.108 §S5.2 of this title) using CIE Illuminant A (2856K).

S14.4.2.2.4.5 After completion of the outdoor exposure test all materials must conform to the color test requirements of this standard in the range of thickness stated by the material manufacturer.

S14.4.2.3 Heat test.

S14.4.2.3.1 Procedure. Two samples of each thickness of each material must be supported at the bottom, with at least 51 mm of the sample above the support, in the vertical position in such a manner that, on each side, the minimum uninterrupted area of exposed surface is not less than 825 sq mm. The samples are placed in a circulating air oven at 79 ± 3 °C for two hours.

S14.4.2.3.2 Performance requirements. After completion of the heat exposure and cooling to room ambient temperature, a test specimen must show no change in shape and general appearance discernable to the naked eye when compared with an unexposed specimen and continue to conform to the applicable color test requirement of this standard.

S14.5 Signal lamp and reflective device physical test procedures and performance requirements.

S14.5.1 Vibration test.

S14.5.1.1 Procedure. The sample device, as mounted on the support supplied, must be bolted to the anvil end of the table of the vibration test machine of Figure 21 and vibrated approximately 750 cpm through a distance of 1⁄8 in. The table must be spring mounted at one end and fitted with steel calks on the underside of the other end. The calks are to make contact with the steel anvil once during each cycle at the completion of the fall. The rack must be operated under a spring tension of 60 to 70 lb. The test must be continued for 1 hour.

S14.5.1.2 Performance requirements. After completion of the vibration test a device showing evidence of material physical weakness, lens or reflector rotation, displacement or rupture of parts except bulb failures, must be considered to have failed, providing that the rotation of the lens or reflector must not be considered as a failure when tests show compliance with specifications despite such rotation.

S14.5.2 Moisture test.

S14.5.2.1 Procedure. The sample device must be mounted in its normal operating position with all drain holes open and subjected to a precipitation of 0.1 in of water per minute, delivered at an angle of 45° from a nozzle with a solid cone spray. During the test the device must revolve about its vertical axis at a rate of 4 rpm for a period of 12 hours followed by a one hour drain period where the device does not rotate and the spray stops. After completion of the moisture test the device must be examined for moisture accumulation.

S14.5.2.2 Performance requirements. Accumulation of moisture in excess of 2 cc or any visible moisture in a sealed reflex unit must constitute a failure.

S14.5.3 Dust test.

S14.5.3.1 Samples. A sealed unit is not required to meet the requirements of this test.

S14.5.3.2 Procedure. The sample device with any drain hole closed must be mounted in its normal operating position, at least 6 in from the wall in a cubical box with inside measurements of 3 ft on each side containing 10 lb of fine powered cement in accordance with ASTM C 150–56, *Standard Specification for Portland Cement* (incorporated by reference, see §571.108 §S5.2 of this title). At intervals of 15 minutes during a test period of 5 hours, the dust must be agitated by compressed air or fan blower by projecting blasts of air for a 2 second period in a downward direction into the dust in such a way that the dust is completely and uniformly diffused throughout the entire cube and allowed to settle. After the completion of the dust test the exterior surface of the device must be cleaned.

S14.5.3.3 Performance requirements. If after a photometry test the maximum photometric intensity of the device is not more than 10% less than the maximum photometric intensity of the same device after being cleaned both inside and outside, the device is considered to have met the requirements of the dust test.

S14.5.4 Corrosion test.

S14.5.4.1 Procedure. The sample device must be subjected to a salt spray (fog) test in accordance with the latest version of ASTM B117–73, *Method of Salt Spray (Fog) Testing* (incorporated by reference, see §571.108 §S5.2 of this title), for a period of 50 hours, consisting of two periods of 24 hour exposure followed by a 1 hr drying time.

S14.5.4.2 Performance requirements. After the completion of the corrosion test there must be no evidence of excessive corrosion which would affect the proper function of the device.

S14.6 Headlamp physical test procedures and performance requirements.

S14.6.1 Abrasion test.

S14.6.1.1 Abrading pad. A new, unused abrading pad constructed of 0000 steel wool not less than 2.5 ± 1 cm wide, rubber cemented to a rigid base shaped to the same vertical contour of the lens, is used for each test. The abrading pad support is equal in size to the pad and the center of the support surface is within ± 2 mm of parallel to the lens surface. The “grain” of the pad is oriented perpendicular to the direction of motion. The density of the pad is such that when the pad is resting unweighted on the lens, the base of
the pad is no closer than 3.2 mm to the lens at its closest point.

S14.6.1.2 Abrading pad alignment. A sample headlamp is mounted in the abrasion test fixture (see Figure 3). The lens is placed in a position such that both the top and bottom surfaces are within the area of the abrasion test pad. A pivot must be used if it is required to follow the contour of the lens.

S14.6.1.3 Abrasion test procedure. The pad is cycled back and forth (1 cycle) for 11 cycles at 4 ± 0.8 in (10 ± 2 cm) per second over at least 80% of the lens surface, including all the area between the upper and lower aiming pads, but not including lens trim rings and edges. A pivot must be used if it is required to follow the contour of the lens.

S14.6.1.4 Performance requirements. After completion of the abrasion test, the sample headlamp must meet the requirements of the applicable photometry tests of Table XIX and Table XVIII. A ¼° reaim is permitted in any direction at any test point.

S14.6.2 Chemical resistance test.

S14.6.2.1 Procedure.

S14.6.2.1.1 Test fluids. The five test fluids used in the chemical resistance test include:

(a) ASTM Reference Fuel C, which is composed of isoctane 50% volume and toluene 50% volume. Isooctane must conform to A2.7 in Annex 2 of the Motor Fuels Section of the 1985 Annual Book of ASTM Standards, Vol. 05.04 (incorporated by reference, see 571.108 §5.2 of this title). ASTM Reference Fuel C must be used as specified in: Paragraph A2.3.2 and A2.3.3 of Annex 2 to Motor Fuels; Section 1 in the 1985 Annual Book of ASTM Standards, Vol. 05.04 (incorporated by reference, see 571.108 §5.2 of this title); and Toluene must conform to ASTM specification D922-84, Standard Specification for Industrial Grade Toluene (incorporated by reference, see 571.108 §5.2 of this title), and Toluene must conform to ASTM specification D362–84, Specification for Industrial Grade Toluene (incorporated by reference, see 571.108 §5.2 of this title), for 50 total hours, consisting of two periods of 24 hours exposure followed by a 1 hour drying period. If a portion of the device is completely protected in service, that portion is covered to prevent salt fog entry during exposure. After removal from the salt spray and the final 1 hour drying period the sample headlamp is examined for corrosion that affect any other applicable tests contained in S14.6. If such corrosion is found, the affected test(s) must be performed on the corrosion sample and the results recorded.

S14.6.3 Corrosion test.

S14.6.3.1 Procedure. A sample headlamp, mounted on a headlamp test fixture in designed operating position and including all accessory equipment necessary to operate in its normal manner, is subjected to a salt spray (fog) test in accordance with ASTM B117–73, Method of Salt Spray (Fog) Testing (incorporated by reference, see 571.108 §5.2 of this title), for 500 total hours, consisting of two periods of 24 hours exposure followed by a 1 hour drying period. If a portion of the device is completely protected in service, that portion is covered to prevent salt fog entry during exposure. After removal from the salt spray and the final 1 hour drying period the sample headlamp is examined for corrosion that affect any other applicable tests contained in S14.6. If such corrosion is found, the affected test(s) must be performed on the corrosion sample and the results recorded.

S14.6.3.2 Performance requirements. After completion of the corrosion test, the sample headlamp must not have any observed corrosion which would result in the failure of any other applicable tests contained in S14.6 and no corrosion of the headlamp mounting and aiming mechanism that would result in the failure of the aiming adjustment tests, inward force test, or torque deflection test of S14.6.

S14.6.4 Corrosion-connector test.

S14.6.4.1 Procedure.

S14.6.4.1.1 A headlamp connector test must be performed on each filament circuit of the sample headlamp prior to the test in S14.6.4.1.2 according to Figure 4 and S14.6.15. The power source is set to provide 12.8 volts and the resistance must be set to produce 10 amperes.

S14.6.4.1.2 The headlamp, with connector attached to the terminals, unfixture and in its designed operating attitude with all drain holes, breathing devices or other designed
openings in their normal operating positions, is subjected to a salt spray (fog) test in accordance with ASTM B117-75, Method of Salt Spray (Fog) Testing (incorporated by reference, see §51.108 S5.2 of this title), for 290 hours, consisting of ten successive 24-hour periods.

S14.6.4.1.3 During each period, the headlamp is mounted in the middle of the chamber and exposed for 23 hours to the salt spray. The spray is not activated during the 24th hour. The bulb is removed from the headlamp and from the test chamber during the one hour of salt spray deactivation and reinserted for the start of the next test period, at the end of the first and last three 23-hour periods of salt spray exposure, and at the end of any two of the fourth through seventh 23-hour periods of salt-spray exposure.

S14.6.4.1.4 The test chamber is closed at all times except for a maximum of 2 minutes which is allowed for removal or replacement of a bulb during each period.

S14.6.4.1.5 After the ten periods, the lens-reflector unit without the bulb must be immersed in deionized water for 5 minutes, then secured and allowed to dry by natural convection only.

S14.6.4.1.6 Using the voltage, resistance and pre-test set up of S14.6.4.1.1 the current in each filament circuit must be measured after the test conducted in S14.6.4.1.2.

S14.6.4.2 Performance requirements.

S14.6.4.2.1 After the completion of the corrosion-connector test, the sample headlamp must show no evidence of external or internal corrosion or rust visible without magnification.

S14.6.4.2.2 Loss of adhesion of any applied coating must not occur more than 3.2 mm from any sharp edge on the inside or outside the headlamp assembly.

S14.6.4.2.3 Corrosion may occur on terminals only if the test current produced during the test of S14.6.4.1.6 is not less than 9.7 amperes.

S14.6.5 Dust test.

S14.6.5.1 Procedure.

S14.6.5.1.1 A sample headlamp, mounted on a headlamp test fixture, with all drain holes, breathing devices or other designed openings in their normal operating positions, is positioned within a cubical box, with inside measurements of 900 mm on each side or larger if required for adequate wall clearance (i.e., a distance of at least 150 mm between the headlamp and any wall of the box).

S14.6.5.1.2 The box contains 4.5 kg of fine powdered cement which conforms to the ASTM C150-77, Standard Specification for Portland Cement (incorporated by reference, see §51.108 S5.2 of this title). Every 15 minutes, the cement is agitated by compressed air or fan blower(s) by projecting blasts of air for a two-second period in a downward direction so that the cement is diffused as uniformly as possible throughout the entire box.

S14.6.5.1.3 This test is continued for five hours after which the exterior surfaces of the headlamp are wiped clean.

S14.6.5.2 Performance requirements. After completion of the dust test, the sample headlamp must meet the requirements of the applicable photometry tests of Table XIX and Table XVIII. A ¼" realm is permitted in any direction at any test point.

S14.6.6 Temperature cycle test and internal heat test.

S14.6.6.1 Samples. A sample headlamp with one or more replaceable light sources is tested according to the procedures of this section for a temperature cycle test and an internal heat test. The same sample headlamp is used in the temperature cycle test and then in the internal heat test.

S14.6.6.2 General procedure.

S14.6.6.2.1 Tests are made with all filaments lighted at design voltage that are intended to be used simultaneously in the headlamp and which in combination draw the highest total wattage. These include but are not limited to filaments used for turn signal lamps, fog lamps, parking lamps, and headlamp lower beams lighted with upper beams when the wiring harness is so connected on the vehicle.

S14.6.6.2.2 If a turn signal is included in the headlamp assembly, it is operated at 90 flashes a minute with a 75% ± 2% current "on time."

S14.6.6.2.3 If the lamp produces both the upper and lower beam, it is tested in both the upper beam mode and the lower beam mode under the conditions above described, except for a headlamp with a single type HB1 or type HB2 light source.

S14.6.6.3 Temperature cycle test.

S14.6.6.3.1 Procedure.

S14.6.6.3.1.1 A sample headlamp, mounted on a headlamp test fixture, is subjected to 10 complete consecutive cycles having the thermal cycle profile shown in Figure 6.

S14.6.6.3.1.2 During the hot cycle, the lamp is energized commencing at point "A" of Figure 6 and de-energized at point "B."

S14.6.6.3.1.3 Separate or single test chambers may be used to generate the environment of Figure 6.

S14.6.6.3.1.4 All drain holes, breathing devices or other openings or vents of the headlamps are set in their normal operating positions.

S14.6.6.3.2 Performance requirements. After completion of the temperature cycle test, the sample headlamp must:

(a) show no evidence of delamination, fractures, entry of moisture, or deterioration of bonding material, color bleeding, warp or deformation visible without magnification;

(b) show no lens warpage greater than 3 mm when measured parallel to the optical axis at the point of intersection of the axis of each light source with the exterior surface of the lens; and
§ 571.108, N.T.

(c) meet the requirements of the applicable photometry tests of Table XIX and Table XVIII. A 1⁄4° realm is permitted in any direction at any test point.

S14.6.6.4 Internal heat test.
S14.6.6.4.1 Procedure.

S14.6.6.4.1.1 A sample headlamp lens surface that would normally be exposed to road dirt is uniformly sprayed with any appropriate mixture of dust and water or other materials to reduce the photometric output at the H–V test point of the upper beam (or the 1⁄4D–1⁄4R test point of the lower beam as applicable) to 25% ± 2% of the output originally measured in the applicable photometric compliance test.

S14.6.6.4.1.2 A headlamp with a single type HB1 or type HB2 light source is tested on the metric compliance test.

S14.6.6.4.1.3 Such reduction is determined under the same conditions as that of the original photometric measurement.

S14.6.6.4.1.4 After the photometric output of the lamp has been reduced as specified above, the sample lamp and its mounting hardware must be mounted in an environmental chamber in a manner similar to that indicated in Figure 7 ‘‘Dirt/Ambient Test Setup.’’

S14.6.6.4.1.5 The headlamp is soaked for one hour at a temperature of 33° + 4° – 0°C (91.4° + 7°F – 32°F) and then the lamp is energized according to the procedure of this section for one hour in a still air condition, allowing the temperature to rise from the soak temperature.

S14.6.6.4.1.6 At the end of one hour the sample lamp is returned to a room ambient temperature of 23° + 4° – 0°C and a relative humidity of 30% ± 10% and allowed to stabilize to the room ambient temperature. The lens is then cleaned.

S14.6.6.4.2 Performance requirements. After completion of the temperature cycle test and meeting its requirements, and completion of the internal heat test, the sample headlamp must:

(a) have no lens warpage greater than 3 mm when measured parallel to the optical axis at the point of intersection of the axis of each light source with the exterior surface of the lens, and

(b) meet the requirements of the applicable photometry tests of Table XIX and Table XVIII. A 1⁄4° realm is permitted in any direction at any test point.

S14.6.7 Humidity test.
S14.6.7.1 Procedure.

S14.6.7.1.1 The test fixture consists of a horizontal steel plate to which three threaded steel or aluminum rods of 1⁄2 inch diameter are screwed vertically behind the headlamp.

S14.6.7.1.2 The sample headlamp assembly is clamped to the vertical rods, which are behind the headlamp. All attachments to the headlamp assembly are made behind the lens and vents or openings, and are not within 2 inches laterally of a vent inlet or outlet.

S14.6.7.1.3 The mounted headlamp assembly is oriented in its design operating position, and is placed in a controlled environment at a temperature of 100° + 7° – 0°F (38° + 4° – 0°C) with a relative humidity of not less than 90%. All drain holes, breathing devices, and other openings are set in their normal operation positions for all phases of the humidity test.

S14.6.7.1.4 The headlamp is subjected to 24 consecutive 3-hour test cycles. In each cycle, the headlamp is energized for 1 hour at design voltage with the highest combination of filament wattages that are intended to be used, and then de-energized for 2 hours. If the headlamp incorporates a turn signal then the turn signal flashes at 90 flashes per minute with a 75% ± 2% current ‘‘on-time.’’

S14.6.7.1.5 Within 3 minutes after the completion of the 24th cycle, the air flow test will begin. The following procedure shall occur: the mounted assembly is removed, placed in an insulating box and covered with foam material so that there is no visible air space around the assembly; the box is closed, taken to the air flow test chamber, and placed within it. Inside the chamber, the assembly with respect to the air flow, is oriented in its design operating position. The assembly is positioned in the chamber so that the center of the lens is in the center of the opening of the air flow entry duct during the test. The headlamp has at least 3 inches clearance on all sides, and at least 4 inches to the entry and exit ducts at the closest points. If vent tubes are used which extend below the lamp body, the 3 inches are measured from the bottom of the vent tube or its protection. The temperature of the chamber is 73° + 7° – 0°F (23° + 4° – 0°C) with a relative humidity of 30% + 10% – 0%. The headlamp is not energized.

S14.6.7.1.6 Before the test specified in paragraph S14.6.7.1.7 of this section, the uniformity of the air flow in the empty test chamber at a plane 4 inches downstream of the air entry duct is measured over a 4 inch square grid. The uniformity of air flow at each grid point is ± 10% of the average air flow specified in paragraph S14.6.7.1.7 of this section.

S14.6.7.1.7 The mounted assembly in the chamber is exposed, for one hour, to an average air flow of 330 + 0 – 30 ft/min as measured with an air velocity measuring probe having an accuracy of ± 3% in the 330 ft/min range. The average air flow is the average of the velocity recorded at six points around the perimeter of the lens. The six points are determined as follows: At the center of the lens, construct a horizontal plane. The first two points are located in the plane, 1 inch outward from the intersection of the plane and
each edge of the lens. Then, trisect the distance between these two points and construct longitudinal vertical planes at the two intermediate locations formed by the trisecting. The remaining points are located in the vertical planes, one inch above the top edge of the lens, and one inch below the bottom edge of the lens.

S14.6.7.1 After one hour, the headlamp is removed and inspected for moisture.

S14.6.7.2 Performance requirements. After completion of the humidity test, the sample headlamp must show no evidence of interior delamination or moisture, fogging or condensation visible without magnification.

S14.6.8 Vibration test.

S14.6.8.1 Samples. The mounting bracket with a sample headlamp installed must not have a resonant frequency in the 10–55 Hz range.

S14.6.8.2 Procedure. The mounted sample headlamp is bolted to the anvil end of the table of the vibration test machine of Figure 21 and vibrated 750 cpm through a distance of 1/8 in. The table is spring mounted at one end and fitted with steel calks on the underside of the other end. The table is of sufficient size to completely contain the test fixture base with no overhang. The calks are to make contact with the steel anvil once during each cycle at the completion of the fall. The rack is operated under a spring tension of 60 to 70 lb. The vibration is applied in the vertical axis of the headlamp as mounted on the vehicle. Bulb filaments are not energized during each cycle at the completion of the fall.

The test is continued for 1 hour.

S14.6.8.3 Performance requirements. After completion of the vibration test, there must be no evidence of loose or broken parts, other than filaments, visible without magnification.

S14.6.9 Sealing test.

S14.6.9.1 Procedure.

S14.6.9.1.1 An unfixed sample headlamp in its design mounting position is placed in water at a temperature of 176 ° ± 5 °F (80 ° ± 3 °C) for one hour. The headlamp is energized in its highest wattage mode, with the test voltage at 12.8 ± 0.1V during immersion.

S14.6.9.1.2 The lamp is then de-energized and immediately submerged in its design mounting position into water at 32 ° ± 2 °F (0 ° ± 2 °C). The water is in a pressurized vessel, and the pressure is increased to 10 psi (70 kPa), upon placing the lamp in the water. The lamp must remain in the pressurized vessel for a period of thirty minutes.

S14.6.9.1.3 This entire procedure is repeated for four cycles.

S14.6.9.1.4 Then the lamp is inspected for any signs of water on its interior. During the high temperature portion of the cycles, the lamp is observed for signs of air escaping from its interior.

S14.6.9.2 Performance requirements. After completion of the sealing test, a sample headlamp confirmed to be sealed need not meet the corrosion test, dust test, or humidity test of this Section. If any water is on the interior or air escapes, the lamp is not a sealed lamp.

S14.6.10 Chemical resistance test of reflectors of replaceable lens headlamps test.

S14.6.10.1 Procedure.

S14.6.10.1.1 Test fluids. The three test fluids used in the chemical resistance test include:

(a) Tar remover (consisting by volume of 45% xylene and 55% petroleum base mineral spirits);

(b) Mineral spirits; and

c) Fluids other than water contained in the manufacturer’s instructions for cleaning the reflector.

S14.6.10.1.2 Fluid application. With a sample headlamp in the headlamp test fixture and the lens removed, the entire surface of the reflector that receives light from a headlamp light source is wiped once to the left and once to the right with a 6-inch square soft cotton cloth (with pressure equally applied) which has been saturated once in a container with 2 ounces of one of the test fluids listed in S14.6.10.1.1. The lamp is wiped within 5 seconds after removal of the cloth from the test fluid.

S14.6.10.1.3 Test duration. After the headlamp has been wiped with the test fluid, it is stored in its designed operating attitude for 48 hours at a temperature of 73 ° ± 7 °F (23 ° ± 4 °C) and a relative humidity of 30% ± 10%. At the end of the 48-hour period, the headlamp is wiped clean with a soft dry cotton cloth and visually inspected.

S14.6.10.2 Performance requirements. After completion of the chemical resistance test, the sample headlamp must have no surface deterioration, coating delamination, fractures, deterioration of bonding or sealing materials, color bleeding or color pickup visible without magnification and the headlamp must meet the requirements of the applicable photometry tests of Table XIX and Table XVIII. A ¼° re-aim is permitted in any direction at any test point.

S14.6.11 Corrosion resistance test of reflectors of replaceable lens headlamps test.

S14.6.11.1 Procedure.

S14.6.11.1.1 A sample headlamp with the lens removed, unfixed, and in its designed operating attitude with all drain holes, breathing devices or other designed openings in their normal operating positions, must be subjected to a salt spray (fog) test in accordance with ASTM B117-73, "Method of Salt Spray (Fog) Testing" (incorporated by reference, see 571.108 S5.2 of this title), for 24 hours, while mounted in the middle of the chamber.

S14.6.11.1.2 Afterwards, the headlamp must be stored in its designed operating attitude for 48 hours at a temperature of 73 ° ± 7 °F (23 ° ± 4 °C) and a relative humidity of 30%
§ 571.108, N.T.

± 10% and allowed to dry by natural convection only. At the end of the 48-hour period, the reflector must be cleaned according to the instructions supplied with the headlamp model. The lens must be replaced, the headlamp reassembled, or on a metal reflector of any other source, on any metal light or heat shield as that receives light from a headlamp light on any part of the headlamp reflector that receives light from a headlamp light source, on any metal light or heat shield assembly, or on a metal reflector of any other lamp. The sample headlamp with the replacement lens installed must meet the requirements of the applicable photometry tests of Table XIX and Table XVIII. A ¼" re-aim is permitted in any direction at any test point.

S14.6.12 Inward force test.
S14.6.12.1 Procedure. A sample headlamp mechanism, including the aiming adjusters, must be subjected to an inward force of 222 N directed normal to the headlamp aiming plane and symmetrically about the center of the headlamp lens face.

S14.6.12.2 Performance requirements. After the completion of the inward force test, a sample headlamp must not permanently recede by more than 2.5 mm. The aim of the headlamp must not permanently deviate by more than 3.2 mm at a distance of 7.6 m. The aim of any headlamp that is capable of being mechanically aimed by externally applied aiming devices must not change by more than 0.30°.

S14.6.13 Torque deflection test.
S14.6.13.1 Procedure. The sample headlamp assembly is mounted in designed vehicle position and set at nominal aim (H=0, V=0).
S14.6.13.1.1 The sample headlamp assembly is mounted in designed vehicle position and set at nominal aim (H=0, V=0).

S14.6.13.1.2 A sealed beam headlamp, except Type G and Type H, is removed from its mounting and replaced by the applicable deflectometer. (Type C and Type D-Figure 18, Type A and Type E-Figure 16, Type B-Figure 17, and Type F-Figure 14).

S14.6.13.2 Sealed beam headlamps Type G and Type H have the adapter of Figure 15 and the deflectometer of Figure 14 attached to the headlamp.

S14.6.13.3 A torque of 2.25 Nm must be applied to the headlamp assembly through the deflectometer and a reading on the thumbwheel is taken. The torque must be removed and a second reading on the thumbwheel is taken.

S14.6.13.4 A torque of 2.25 Nm must be applied to the headlamp assembly through the deflectometer and a reading on the thumbwheel is taken. The torque must be removed and a second reading on the thumbwheel is taken.

S14.6.13.5 Headlamps other than sealed beam headlamps must have the downward force used to create the torque applied parallel to the aiming reference plane, through the aiming pads, and displaced forward using a lever arm such that the force is applied on an axis that is perpendicular to the aiming reference plane and originates at the center of the aiming pad pattern (see Figure 3).

S14.6.13.6 For headlamps using the aiming pad locations of Group I, the distance between the point of application of force and the aiming reference plane is not less than 167.9 mm plus the distance to the secondary plane, if used.

S14.6.13.7 For headlamps using the aiming pad locations of Group II, the distance between the point of application of force and the aiming reference plane is not less than 167.9 mm plus the distance to the secondary plane, if used.

S14.6.13.8 For headlamps using the non-adjustable Headlamp Aiming Device Locating Plates for the 146 mm diameter, the 176 mm diameter, and the 92x150 mm sealed beam, the distance between the point of application of force and the aiming plane is not, respectively, less than 177.4 mm, 176.2 mm, and 183.7 mm.

S14.6.13.9 Performance requirements. The aim of each sample headlamp must not deviate more than 0.30° when the downward torque is removed.

S14.6.14 Retaining ring test.
S14.6.14.1 Procedure. A sample headlamp with the minimum flange thickness of: Type A—31.5 mm, Type B—10.1 mm, Type C—11.8 mm, Type D—11.8 mm, Type E—31.5 mm, and Type F—8.6 mm, is secured between the appropriate mounting ring and retaining ring (mounting ring and aiming ring for Type F).

S14.6.14.2 Performance requirements. The sample headlamp when secured per the procedure must be held tight enough that it will not rattle.

S14.6.15 Headlamp connector test.
S14.6.15.1 Procedure. A sample headlamp connected into the test circuit of Figure 4 has the power supply adjusted until 10 amperes DC are flowing through the circuit. The test is repeated for each filament circuit of the headlamp.

S14.6.15.2 Performance requirements. The voltage drop, as measured in the test circuit of Figure 4, must not exceed 40 mv DC in any applicable filament circuit of the sample headlamp.

S14.6.16 Headlamp wattage test.
S14.6.16.1 Procedure. A sample headlamp that has been seasoned is energized so as to have 12.8v ± 20 mv DC applied across each filament circuit and the current flowing in each circuit is measured.

S14.6.16.2 Performance requirements. The wattage of each filament circuit of the sample headlamp must not exceed the applicable value for that type of headlamp as shown in Table II.

S14.6.17 Aiming adjustment test-laboratory.
S14.6.17.1 Procedure. A sample headlamp is mounted in design position at nominal (H =
0, \( V = 0 \) aim with an accurate measuring device such as a spot projector or other equally accurate means attached. The headlamp is adjusted to the extremes of travel in each horizontal and vertical direction.

§ 571.108, Nl.

S14.6.18.2 Performance requirements. Usually aimed lower beam headlamps without a VHAD are required not to have a horizontal adjustment mechanism and horizontal aim range requirements do not apply.

S14.6.18.2.1 A sample sealed beam headlamp, other than a Type F, tested per the procedure must provide a minimum of \( \pm 4.0 \)° adjustment range in both the vertical and horizontal planes, and if equipped with independent vertical and horizontal aiming screws, the adjustment must be such that neither the vertical nor horizontal aim must deviate more than 100 mm from horizontal or vertical planes, respectively, at a distance of 7.6 m through an angle of \( \pm 4.0 \)°.

S14.6.18.2.2 A sample Type F sealed beam, integral beam, replaceable bulb, or combination headlamp tested per the procedure must provide a minimum of \( \pm 4.0 \)° adjustment range in the vertical plane and \( \pm 2.5 \)° in the horizontal plane and if equipped with independent vertical and horizontal aiming screws, the adjustment must be such that neither the vertical nor horizontal aim must deviate more than 100 mm from horizontal or vertical planes, respectively, at a distance of 7.6 m through an angle of \( \pm 2.5 \)° and \( \pm 4.0 \)°, respectively.

S14.6.18.2.3 A sample headlamp that is aimed by moving the reflector relative to the lens and headlamp housing, and vice versa must provide a minimum adjustment range in the vertical plane not less than the full range of the pitch on the vehicle on which it is installed.

S14.6.18.2.4 The vertical aim mechanism must be continuously variable over the full range.

S14.6.18.2.5 The adjustment of one aim axis through its full-on-vehicle range must not cause the aim of the other axis to deviate more than \( \pm 0.76 \)°. If this performance is not achievable, the requirements of S10.18.3.1 apply, except that if the aiming mechanism is not a VHAD, the requirements specific to VHADs are not applicable, and the instruction must be specific to the aiming mechanism installed.

S14.7 Replaceable light source physical test procedures and performance requirements.

S14.7.1 Deflection test for replaceable light sources.

S14.7.1.1 Procedure.

S14.7.1.1.1 With the sample light source rigidly mounted in a fixture in a manner indicated in Figure 8, a force 4.0 ± 0.1 pounds (17.8 ± 0.4N) is applied at a distance “A” from the reference plane perpendicular to the longitudinal axis of the glass capsule and parallel to the smallest dimension of the pressed glass capsule seal.

S14.7.1.1.2 The force is applied (using a rod with a hard rubber tip with a minimum spherical radius of .039 in \[1 \text{mm}\]) radially to the surface of the glass capsule in four locations in a plane parallel to the reference plane and spaced at a distance “A” from that plane. These force applications are spaced 90° apart starting at the point perpendicular to the smallest dimension of the pressed seal of the glass capsule.

S14.7.1.1.3. The bulb deflection is measured at the glass capsule surface at 180° opposite to the force application. Distance “A” for a replaceable light source other than an HB Type is the dimension provided in accordance with appendix A of part 564 of this chapter, section I.A.1 if the light source has a lower beam filament, or as specified in section I.B.1 if the light source has only an upper beam filament.

S14.7.1.2 Performance requirements. After completion of the deflection test, a sample light source must have no permanent deflection of the glass envelope exceeding 0.13 mm in the direction of applied force.

S14.7.2 Pressure test for replaceable light sources.

S14.7.2.1 Procedure.

S14.7.2.1.1 The capsule, lead wires and/or terminals, and seal on each sample Type HB1, Type HB3, Type HB4, and Type HB5 light source, and on any other replaceable light source which uses a seal, is installed in a pressure chamber as shown in Figure 10 so as to provide an airtight seal. The diameter of the aperture in Figure 10 on a replaceable light source (other than an HB Type) must be that dimension furnished for such light.
source in compliance with appendix A or appendix B of part 561 of this chapter.

S14.7.2.1.2 The light source is immersed in water for one minute while inserted in a cylindrical aperture specified for the light source, and subjected to an air pressure of 70 kPa (10 psig) on the glass capsule side.

S14.7.2.2 Performance requirements. After completion of the pressure test, the sample light source with an airtight seal on the low pressure (connector side) must show no evidence of air bubbles on that side.

S14.7.3 Replaceable light source power and flux measurement procedure. The measurement of maximum power and luminous flux that is submitted in compliance with section VII of appendix A of part 561 of this chapter, or section IV of appendix B of part 561 of this chapter, is made in accordance with this paragraph.

S14.7.3.1 Seasoning. The filament or discharge arc is seasoned before measurement of either maximum power and luminous flux.

S14.7.3.1.1 Resistive filament source. Seasoning of a light source with a resistive element type filament is made in accordance with this S14.2.5.4 of this standard.

S14.7.3.1.2 Discharge source. For a light source using excited gas mixtures as a filament or discharge arc, seasoning of the light source system, including any ballast required for its operation, is made in accordance with section 4.0 of SAE Recommended Practice J2009 FEB93, Discharge Forward Lighting Systems.

S14.7.3.2 Test voltage. Measurements are made with a direct current test voltage of 12.8 V regulated within one quarter of one percent.

S14.7.3.3 Luminous flux measurement. The measurement of luminous flux is made in accordance with the Illuminating Engineering Society of North America, LM45; IES Approved Method for Electrical and Photometric Measurements of General Service Incandescent Filament Lamps (April 1980) (incorporated by reference, see §571.108 (S.2 of this title).

S14.7.3.3.1 Resistive filament light source setup. Luminous flux measurements are made with the black cap installed on Type HB1, Type HB2, Type HB4, and Type HB5, and on any other replaceable light source so designed, and is with the electrical conductor and light source base shrouded with an opaque white cover, except for the portion normally located within the interior of the lamp housing. The measurement of luminous flux for the Types HB3 and HB4 is made with the base covered with a white cover as shown in the drawings for Types HB3 and HB4 filed in Docket No. NHTSA 98–3397. The white covers are used to eliminate the likelihood of incorrect lumen measurement that will occur should the reflectance of the light source base and electrical connector be low.

S14.7.3.3.2 Discharge light source setup. With the test voltage applied to the ballast input terminals, the measurement of luminous flux is made with the black cap installed, if so designed, and is made with an opaque white colored cover, except for the sample VHAD and associated headlamp(s) or headlamp assembly must be rigidly mounted in a headlamp test fixture with the aiming plane horizontal and vertical and with the scale on the device set at 0.

S14.8 Vehicle headlamp aiming devices (VHAD) physical test procedures and performance requirements.

S14.8.1 Samples. The same VHAD and associated headlamp(s) or headlamp assembly must be rigidly mounted in a headlamp test fixture with the aiming plane horizontal and vertical and with the scale on the device set at 0.

S14.8.2 Scale graduation test.

S14.8.2.1 Procedure. Check each graduation on the horizontal and vertical aim scales.

S14.8.2.2 Performance requirements. Scale graduation from correct aim must not exceed ± 0.2° horizontally and ± 0.1° vertically.

S14.8.3 Cold scale graduation test.

S14.8.3.1 Procedure. The VHAD and an unlighted headlamp assembly must then be stabilized at −7° ± 3° C in a circulating air environmental test chamber for a 30 minute temperature soak.

S14.8.3.2 Performance requirements. After completion of a 30 minute temperature soak the variation from correct aim shown by the sample VHAD must not exceed ± 0.2° horizontally and ± 0.1° vertically.

S14.8.4 Hot scale graduation test.

S14.8.4.1 Procedure. The VHAD and the headlamp assembly with its highest wattage filament, or combination of filaments intended to be used simultaneously, energized at its design voltage, is then stabilized at 38° ± 3° C in a circulating air environmental test chamber for a 30 minute temperature soak.

S14.8.4.2 Performance requirements. After completion of a 30 minute temperature soak the variation from correct aim shown by the sample VHAD must not exceed ± 0.2° horizontally and ± 0.1° vertically.

S14.8.5 Thermal cycle test.

S14.8.5.1 Procedure. The VHAD and an unlighted headlamp assembly are then placed in a circulating air environmental test chamber and exposed to a temperature of 60° ± 3° C for 24 hours, followed by a temperature of −40° ± 3° C for 24 hours, and are then permitted to return to room temperature.

S14.8.5.2 Performance requirements. After completion of the thermal cycle test the variation from correct aim shown by the sample VHAD must not exceed ± 0.2° horizontally and ± 0.1° vertically.

S14.8.6 Corrosion test.

S14.8.6.1 Procedure. The VHAD and headlamp assembly are then tested according to the headlamp corrosion test of S14.6.3.

S14.8.6.2 Performance requirements. After completion of the corrosion test the sample
§571.108, Nl.

VHAD and headlamp must not have any observed corrosion that would result in the failure of any other applicable tests contained in this section.

S14.8.7 Photometry test.
S14.8.7.1 Procedure. The VHAD and headlamp assembly are then tested for photometric compliance according to the procedure of S14.2.5 and for replacement units per S10.18.8.4.

S14.8.7.2 Performance requirements. The sample headlamp must comply with the applicable photometric requirements of Table XIX and Table XVIII and with replacement photometric requirements of Table applicable units installed per S10.18.8.4.

S14.9 Associated equipment physical test procedures and performance requirements.

S14.9.1 Turn signal operating unit durability test.

S14.9.1.1 Power supply specifications. During the test the unit is operated at 6.4 volts for 6 volt systems or 12.8 volts for 12 volt systems from a power supply meeting the following requirements:

(a) An output current that is at least 10 times the load current;
(b) Voltage regulation that allows a voltage change of less than 5%;
(c) Ripple voltage of not more than 5%;
(d) A response time of not more than 25 milliseconds rise time from 0 to rated current at rated voltage in a pure resistance circuit; and
(e) An output impedance of not more than 0.005 ohms dc.

S14.9.1.2 Procedure.

S14.9.1.2.1 The sample unit is operated with the maximum bulb load it will experience on the vehicle on which it will be installed. Bulbs that fail during the test are replaced. The hazard warning signal flasher is not to be included in the test circuit.

S14.9.1.2.2 The unit is turned “on” and “off” in its normal operating manner at a rate not to exceed 15 complete cycles per minute. One complete cycle consists of the sequence: Off, left turn, off, right turn, and return to off.

S14.9.1.2.3 The voltage drop from the input terminal of the device to each lamp output terminal, including 3 in of 16 or 18 gage wire, is measured at the start of the test, at intervals of not more than 25,000 cycles during the test, and at the completion of the test.

S14.9.1.3 Performance requirements.

S14.9.1.3.1 A turn signal operating unit is considered to have met the requirements of the durability test if it remains operational after completing at least 175,000 cycles for a unit installed on a multipurpose passenger vehicle, truck, or bus 2032 mm or more in overall width, and the voltage drop between the input contact and any output contact, including required length of wire, does not exceed 0.25 volts.

S14.9.1.3.2 A turn signal operating unit is considered to have met the requirements of the durability test if it remains operational after completing at least 175,000 cycles for a unit installed on a multipurpose passenger vehicle, truck, or bus 2032 mm or more in overall width, and the voltage drop between the input contact and any output contact, including required length of wire, does not exceed 0.25 volts.

S14.9.1.3.3 If stop signals also operate through the turn signal operating unit, the voltage drop of any additional switch contacts must meet the same requirements as the turn signal contacts.

S14.9.2 Vehicular hazard warning signal operating unit durability test.

S14.9.2.1 Procedure.

S14.9.2.1.1 The sample unit is operated at its rated voltage with the maximum bulb load it will experience on the vehicle on which it will be installed. Bulbs that fail during the test are replaced. The hazard warning signal flasher is not to be included in the test circuit.

S14.9.2.1.2 The unit is turned “on” and “off” in its normal operating manner at a rate not to exceed 15 complete cycles per minute. One complete cycle consists of the sequence: Off, on, and return to off. The test consists of 10,000 cycles at an ambient temperature of 75 ± 10 °F followed by 1 hour constant “on” at the same temperature.

S14.9.2.1.3 The voltage drop from the input terminal of the device to each lamp output terminal, including 3 in of 16 or 18 gage wire, is measured at the start of the test and at the completion of the test.

S14.9.2.2 Performance requirements. A hazard warning signal operating unit is considered to have met the requirements of the durability test if it remains operational after completing 10,000 cycles and the 1 hour constant “on” and the voltage drop between the input contact and any output contact, including required length of wire, does not exceed 0.3 volts for either 6.4 or 12.8 line voltage both at the start and completion of the test.

S14.9.2.3 Turn signal flasher and vehicular hazard warning signal flasher tests.

S14.9.3.1 Standard test circuit. All turn signal flasher and vehicular hazard warning signal flasher tests use the standard test circuit of Figure 22.

S14.9.3.1.1 Test circuit setup. The effective series resistance in the total circuit between the power supply and the bulb sockets (excluding the flasher and bulb load(s) using shorting bars) is 0.10 ± 0.01 ohm.

S14.9.3.1.2 The circuit resistance at A-B of Figure 22 is measured with flasher and bulb load(s) each shorted out with an effective shunt resistance not to exceed 0.005 ohms.
S14.9.3.1.3 The voltage to the bulbs at C–D of Figure 22 is adjusted to 12.8 volts (or 6.4 volts) with the flasher shorted out by an effective shunt resistance not to exceed 0.005 ohms. The load current is adjusted by simultaneously adjusting trimmer resistors, R.

S14.9.3.1.4 For testing fixed-load flashers at other required voltages, adjust the power supply to provide required voltages, at the required temperatures, at C–D of Figure 22, without readjustment of trimming resistors, R.

S14.9.3.1.5 For variable-load flashers, the circuit is first adjusted for 12.8 volts (or 6.4 volts) at C–D of Figure 22, with the minimum required load, and the power supply is adjusted to provide other required test voltages, at required temperatures, at C–D of Figure 22, without readjustment of trimming resistors, R (each such required voltage being set with the minimum required load in place). The required voltage tests with the maximum load are conducted without readjusting each corresponding power supply voltage, previously set with minimum bulb load.

S14.9.3.1.6 A suitable high impedance measuring device connected to points X–Y in Figure 22 is used for measuring flash rate, percent current “on” time, and voltage drop across the flasher. The measurement of these quantities does not affect the circuit.

S14.9.3.2 Power supply specifications.

S14.9.3.2.1 Starting time, voltage drop, and flash rate and percent current “on” time tests. The power supply used in the standard test circuit for conducting the starting time, the voltage drop, and the flash rate and percent current “on” time tests must comply with the following specifications:

(a) Must not generate any adverse transients not present in motor vehicles;
(b) Be capable of supplying 13 vdc and 14 vdc for 12 volt flashers and 6.5 vdc and 7 vdc for 6 volt flashers to the input terminals of the standard test circuit;
(c) Be capable of supplying a continuous output current of the design load for one flasher times the number of flashers used in the starting time test using the standard test circuit;
(d) Be capable of supplying a continuous output current of the design load for one flasher times the number of flashers used in the starting time test using the standard test circuit;
(e) Be capable of supplying a continuous output current of the design load for one flasher times the number of flashers used in the starting time test using the standard test circuit;
(f) A ripple voltage of 300 mv, peak to peak.

S14.9.3.3 Turn signal flasher starting time test.

S14.9.3.3.1 Samples. Twenty sample flashers chosen from random from fifty representative samples are subjected to a starting time test using the standard test circuit.

S14.9.3.3.2 Procedure. The test is conducted in an ambient temperature of 75 ± 10 °F with the design load (variable load flashers are tested with their minimum and their maximum design load) connected and the power source for the test circuit adjusted to apply design voltage at the bulbs.

S14.9.3.3.3 Performance requirements. The requirements of the starting time test are considered to have been met if 17 or 20 samples comply with the following:

(a) A flasher having normally closed contacts must open (turn off) within 1.0 second for a device designed to operate two signal lamps, or within 1.25 seconds for a device desined to operate more than two lamps, or
(b) A flasher having normally open contacts must complete the first cycle (close the contacts and then open the contacts) within 1.5 seconds.

S14.9.3.4 Turn signal flasher voltage drop test.

S14.9.3.4.1 Samples. The same twenty sample flashers used in the starting time test are subjected to a voltage drop test using the standard test circuit.

S14.9.3.4.2 Procedure. The test is conducted in an ambient temperature of 75 ± 10 °F with the design load (variable load flashers are tested with their maximum design load) connected...
and the power source for the standard test circuit adjusted to apply 12.8 volts or 6.4 volts at the bulbs according to the flasher rating.

S14.9.3.4.2.2 The voltage drop is measured between the input and load terminals of the flasher during the “on” period after the flashers have completed at least five consecutive cycles.

S14.9.3.4.3 Performance requirements. The requirements of the voltage drop test are considered to have been met if 17 of 20 samples comply with the lowest voltage drop across any flasher not exceeding 0.80 volt.

S14.9.3.5 Turn signal flasher flash rate and percent current “on” time test.

S14.9.3.5.1 Samples. The same twenty sample flashers used in the voltage drop test are subjected to a flash rate and percent of current “on” time test.

S14.9.3.5.2 Procedure.

S14.9.3.5.2.1 The test is conducted using the standard test circuit with the design load (variable load flashers are tested with their minimum and their maximum design load) connected and design voltage applied to the bulbs.

S14.9.3.5.2.2 Compliance is determined using the following combinations of ambient temperature and bulb voltage:

(a) 12.8 volts (or 6.4 volts) and 75° ± 10° F.
(b) 12.0 volts (or 6.0 volts) and 0° ± 5° F.
(c) 15.0 volts (or 7.5 volts) and 0° ± 5° F.
(d) 11.0 volts (or 5.5 volts) and 125° ± 5° F.
(e) 14.0 volts (or 7.0 volts) and 125° ± 5° F.

S14.9.3.5.2.3 Flash rate and percent current “on” time are measured after the flashers have completed five consecutive cycles and are determined by an average of at least three consecutive cycles.

S14.9.3.5.3 Performance requirements. The requirements of the flash rate and percent current “on” time test are considered to have been met if 17 of 20 samples comply with the following:

(a) The performance of a normally closed type flasher must be within the unshaded portion of the polygon shown in Figure 2, or

(b) The performance of a normally open type flasher must be within the entire rectangle including the shaded areas shown in Figure 2.

S14.9.3.6 Turn signal flasher durability test.

S14.9.3.6.1 Samples. Twenty sample flashers chosen from random from fifty representative samples are subjected to a starting time test using the standard test circuit.

S14.9.3.6.2 Procedure.

S14.9.3.6.2.1 The test is conducted in an ambient temperature of 75° ± 10° F with the minimum and maximum load connected and the power source for the test circuit adjusted to apply design voltage at the bulbs.

S14.9.3.6.2.2 The time measurement starts when the voltage is initially applied.

S14.9.3.6.3 Performance requirements. The requirements of the starting time test are considered to have been met if 17 of 20 samples comply with the following:

(a) A flasher having normally closed contacts must open (turn off) within 1.5 seconds after the voltage is applied, or

(b) A flasher having normally open contacts must complete the first cycle (close the contacts and then open the contacts) within 1.5 seconds after the voltage is applied.

S14.9.3.7 Vehicular hazard warning signal flasher starting time test.

S14.9.3.7.1 Samples. Twenty sample flashers chosen from random from fifty representative samples are subjected to a starting time test using the standard test circuit.

S14.9.3.7.2 Procedure.

S14.9.3.7.2.1 The test is conducted in an ambient temperature of 75° ± 10° F with the minimum and maximum load connected and the power source for the test circuit adjusted to apply design voltage at the bulbs.

S14.9.3.7.2.2 The time measurement starts when the voltage is initially applied.

S14.9.3.7.3 Performance requirements. The requirements of the starting time test are considered to have been met if 17 of 20 samples comply with the following:

(a) A flasher having normally closed contacts must open (turn off) within 1.5 seconds after the voltage is applied, or

(b) A flasher having normally open contacts must complete the first cycle (close the contacts and then open the contacts) within 1.5 seconds after the voltage is applied.

S14.9.3.8 Vehicular hazard warning signal flasher voltage drop test.

S14.9.3.8.1 Samples. The same twenty sample flashers used in the starting time test are subjected to a voltage drop test using the standard test circuit.

S14.9.3.8.2 Procedure.

S14.9.3.8.2.1 The test is conducted in an ambient temperature of 75° ± 10° F with the maximum design load connected and the power source for the test circuit adjusted to apply design voltage at the bulbs.

S14.9.3.8.2.2 The voltage drop is measured between the input and load terminals of the flasher during the “on” period after the flashers have completed at least five consecutive cycles.

S14.9.3.8.3 Performance requirements. The requirements of the voltage drop test are considered to have been met if 17 of 20 samples comply with the lowest voltage drop across any flasher not exceeding 0.8 volt.
§ 571.108, N.I.

S14.9.3.9 Vehicular hazard warning signal flasher rate and percent “on” time test.

S14.9.3.9.1 Samples. The same twenty sample flashers used in the voltage drop test are subjected to a flash rate and percent of current “on” time test.

S14.9.3.9.2 Procedure.

S14.9.3.9.2.1 The test is conducted using the standard test circuit by and applying loads of from two signal lamps to the maximum design loading including pilot indicator.

S14.9.3.9.2.2 Compliance is determined using the following combinations of ambient temperature and bulb voltage:

- (a) 12.8 volts (or 6.4 volts) and 75° ± 10°F.
- (b) 11.0 volts (or 5.5 volts) and 125° ± 5°F.
- (c) 11.0 volts (or 5.5 volts) and 0° ± 5°F.
- (d) 13.0 volts (or 6.5 volts) and 125° ± 5°F.
- (e) 13.0 volts (or 6.5 volts) and 0° ± 5°F.

S14.9.3.9.2.3 Flash rate and percent current “on” time are measured after the flashers have completed five consecutive cycles and are determined by an average of at least three consecutive cycles.

S14.9.3.9.3 Performance requirements. The requirements of the flash rate and percent current “on” time test are considered to have been met if 17 of 20 samples comply with the following:

- (a) The performance of a normally closed type flasher must be within the entire region of the polygon shown in Figure 2, or
- (b) The performance of a normally open type flasher must be within the entire rectangle including the shaded areas shown in Figure 2.

S14.9.3.10 Vehicular hazard warning signal flasher durability test.

S14.9.3.10.1 Samples. Twenty sample flashers chosen from random from the thirty samples not used in the previous tests are subjected to a durability test.

S14.9.3.10.2 Procedure.

S14.9.3.10.2.1 Conformance of the samples to the starting time, voltage drop, and flash rate and percent of current “on” time test (limited to the 12.8 volts or 6.4 volts and 75° ± 10°F test condition only) is established.

S14.9.3.10.2.2 The test is conducted on each sample with the maximum design load connected and 13.0 volts (or 6.5 volts) applied to the input terminals of the standard test circuit.

S14.9.3.10.2.3 The flasher is subjected to continuous flashing for a total time of 36 hours in an ambient temperature of 75° ± 10°F.

S14.9.3.10.3 Performance requirements. The requirements of the durability test are considered to have been met if, after completion, 17 of 20 samples comply with the performance requirements of the starting time, voltage drop, and flash rate and percent current “on” time tests (limited to the 12.8 volts or 6.4 volts and 75° ± 10°F test condition only) when tested in the standard test circuit with the power source adjusted to provide design voltage to the bulbs and with a minimum load of two signal lamp bulbs and the maximum design load, including pilot lamp, as specified by the manufacturer at an ambient temperature of 75° ± 10°F.

S14.9.3.11 Semiautomatic headlamp beam switching device tests.

S14.9.3.11.1 Test conditions. All tests are conducted with 13 volts input to the device unless otherwise specified.

S14.9.3.11.2 Sensitivity test.

S14.9.3.11.2.1 Samples. The sample device is mounted in and operated in the laboratory in the same environment as that encountered on the vehicle, that is tinted glass, grille work, etc.

S14.9.3.11.2.2 Procedure.

S14.9.3.11.2.2.1 The sample device is adjusted for sensitivity in accordance with the manufacturer’s instructions. It is exposed to a light source capable of providing a variable intensity of at least 1.5 cd to 150 cd at 100 feet from the sample device.

S14.9.3.11.2.2.2 The device is switched to the lower beam mode in accordance with the “dim” limits specified and switched back to the upper beam mode in accordance with the “hold” limits specified for the specified test positions.

S14.9.3.11.2.2.3 To provide more complete information on sensitivity throughout the required vertical and horizontal angles, a set of constant footcandle curves are made at “dim” sensitivities of 17, 25, and 100 cd at 100 ft.

S14.9.3.11.2.3 Performance requirements.

S14.9.3.11.2.3.1 Operating limits.

S14.9.3.11.2.3.2 There must be no sensitivity voids shown in the constant foot-candle curves within the area limited by the test positions.

S14.9.3.11.3 Voltage regulation test.

S14.9.3.11.3.1 Procedure.

S14.9.3.11.3.1.1 The sensitivity of the sample device is adjusted so that it complies with the sensitivity test.

S14.9.3.11.3.1.2 The ‘dim’ sensitivity is measured at the H–V test position at 11 volts input to the device and at 15 volts input to the device.

S14.9.3.11.3.2 Performance requirements. The device must switch to the lower beam mode at between 8 (cd at 100 ft) and 25 (cd at 100 ft) with the input voltage at 11 volts and at 15 volts.

S14.9.3.11.4 Manual override test.

S14.9.3.11.4.1 Procedure.

S14.9.3.11.4.1.1 The sensitivity of the sample device is adjusted so that it complies with the sensitivity test.

S14.9.3.11.4.1.2 The device is exposed to a test light that causes it to switch to the lower beam mode.

S14.9.3.11.4.1.3 The manufacturer’s instructions are followed to cause the device to override the test light and switch to upper beam.

S14.9.3.11.4.1.4 In a similar manner, the test light is extinguished to cause the device to switch to the upper beam mode.

S14.9.3.11.4.1.5 Again the manufacturer’s instructions are followed to cause the device to switch to lower beam.

S14.9.3.11.4.2 Performance requirements. The device, when operated in accordance with the manufacturer’s instructions, must switch to the opposite beam with the test light energized and with the test light extinguished.

S14.9.3.11.5 Warmup test.

S14.9.3.11.5.1 Procedure.

S14.9.3.11.5.1.1 The sensitivity of the sample device is adjusted so that it complies with the sensitivity test and the test lamp extinguished.

S14.9.3.11.5.1.2 The test lamp will then be energized at a level of 25 (cd at 100 ft) at the H–V position of the device and the time for the device to switch to lower beam is measured.

S14.9.3.11.5.2 Performance requirements. If the warmup time of the device exceeds 10 seconds it shall maintain the headlamps on lower beam during warmup.

S14.9.3.11.6 Temperature test.

S14.9.3.11.6.1 Procedure.

S14.9.3.11.6.1.1 The sample device is exposed for 1 hour in a temperature corresponding to that at the device mounting location.

S14.9.3.11.6.1.2 For a device mounted in the passenger compartment or the engine compartment, the temperature is 210 °F, mounted elsewhere, the temperature is 150 °F.

S14.9.3.11.6.1.3 After this exposure the H–V “dim” sensitivity of the sample device is measured over the temperature range of −30 °F to +100 °F.

S14.9.3.11.6.2 Performance requirements. The device must switch to the lower beam mode between 8 (cd at 100 ft) and 25 (cd at 100 ft) over the temperature range of −30 °F to +100 °F.

S14.9.3.11.7 Dust test.

S14.9.3.11.7.1 Procedure.

S14.9.3.11.7.1.1 The sensitivity of the sample device is adjusted so that it complies with the sensitivity test.

S14.9.3.11.7.1.2 The device is then subjected to the dust test of S14.5.3.

S14.9.3.11.7.1.3 At the conclusion of the dust exposure the lens of the device must be wiped clean and the H–V “dim” sensitivity of the sample device is measured.

S14.9.3.11.7.2 Performance requirements. The device must switch to the lower beam mode between 8 (cd at 100 ft) and 25 (cd at 100 ft).

S14.9.3.11.8 Corrosion test.

S14.9.3.11.8.1 Procedure.

S14.9.3.11.8.1.1 The sensitivity of the sample device is adjusted so that it complies with the sensitivity test.

S14.9.3.11.8.1.2 All system components located outside the passenger compartment must be subjected to the corrosion test of S14.5.4 with the device not operating.

S14.9.3.11.8.1.3 Water is not permitted to accumulate on any connector socket.

S14.9.3.11.8.1.4 At the conclusion of the test the H–V “dim” sensitivity of the sample device must be measured.

S14.9.3.11.8.2 Performance requirements. The sample device must switch to the lower beam mode between 8 (cd at 100 ft) and 25 (cd at 100 ft).

S14.9.3.11.9 Vibration test.

S14.9.3.11.9.1 Procedure.

S14.9.3.11.9.1.1 The sensitivity of the sample device is adjusted so that it complies with the sensitivity test and the mechanical aim of the photounit determined.

S14.9.3.11.9.1.2 The sample device must be mounted in proper vehicle position and subjected to vibration of 5g constant acceleration for ½ hour in each of three directions: vertical; horizontal and parallel to the vehicle longitudinal axis; and horizontal and normal to the vehicle longitudinal axis.

S14.9.3.11.9.1.3 The vibration frequency must be varied from 30 to 200 and back to 30 cycles per second over a period of approximately 1 minute.

S14.9.3.11.9.1.4 The device must be operating during the test.

S14.9.3.11.9.1.5 At the conclusion of the test the H–V “dim” sensitivity of the sample device and the mechanical aim of the photounit must be measured.

S14.9.3.11.9.2 Performance requirements.

S14.9.3.11.9.2.1 The sample device must switch to the lower beam mode between 8 (cd at 100 ft) and 25 (cd at 100 ft).
S14.9.3.11.9.2.2 The mechanical aim of the device photounit must not have changed by more than 0.25° from the initial value.
S14.9.3.11.10 Sunlight test.
S14.9.3.11.10.1 Procedure.
S14.9.3.11.10.1.1 The sample device must be exposed for 1 hour in bright noonday sunlight (5000 fc minimum illumination with a clear sky) with the photounit aimed as it would be in service and facing an unobstructed portion of the horizon in the direction of the sun.
S14.9.3.11.10.1.2 The device must then be rested for 1 hour in normal room light at room temperature and the H–V “dim” sensitivity of the sample device is measured.
S14.9.3.11.10.2 Performance requirements.
The sample device must switch to the lower beam mode between 8 (cd at 100 ft) and 25 (cd at 100 ft).
S14.9.3.11.11 Durability test.
S14.9.3.11.11.1 Procedure.
S14.9.3.11.11.1.1 The sensitivity of the sample device is adjusted so that it complies with the sensitivity test.
S14.9.3.11.11.1.2 The device photounit operated at a 13.0 input voltage on a cycle of 90 minutes on and 30 minutes off must be activated by a 60 cd light source at 100 ft, or equivalent, which is cycled on and off 4 times per minute for a period of 200 hours.
S14.9.3.11.11.1.3 The device must then rest for 2 hours in a lighted area of 50 to 150 fc after which the H–V “dim” sensitivity must be measured.
S14.9.3.11.11.2 Performance requirements.
The sample device must switch to the lower beam mode between 8 (cd at 100 ft) and 25 (cd at 100 ft).
S14.9.3.11.12 Return to upper beam test.
S14.9.3.11.12.1 Procedure.
S14.9.3.11.12.1.1 The sensitivity of the sample device is adjusted so that it complies with the sensitivity test.
S14.9.3.11.12.1.2 The lens of the photounit must be exposed to light of 100 fc for 10 seconds.
S14.9.3.11.12.2 Performance requirements.
The sample device must switch to upper beam mode within 2 seconds after the 100 fc light is extinguished.

**MAXIMUM PHOTOMETRIC INTENSITY**<sup>56</sup>  
300  500  750  900  900

<sup>1</sup> The measured values at each test point must not be less than 60% of the minimum value.
<sup>2</sup> The photometric intensity values between test points must not be less than the lower specified minimum value of the two closest adjacent test points on a horizontal or vertical line.
<sup>3</sup> Where turn signal lamps are mounted with their axis of reference less than 750 mm above the road surface, photometry requirements below 5° down may be met at 3° down rather than at the required downward angle.
<sup>4</sup> The maximum photometric intensity must not occur over any area larger than that generated by a 0.5° radius within a solid angle defined by the test point range.
<sup>5</sup> Values preceded by a slash (/) apply only to multipurpose passenger vehicles, trucks, trailers, and busses of 2032 mm or more in overall width.
<sup>6</sup> A double faced turn signal lamp installed as described in §6.1.1.3 on a truck tractor need only meet the photometric requirements for a left side lamp where the lamp is mounted on the left side of the vehicle, and for a right side lamp where the lamp is mounted on the right side of the vehicle.
<sup>7</sup> Required only when combined turn signal lamp and clearance lamp is installed on a vehicle 2032 mm or more in overall width.
<sup>8</sup> When a taillamp (or clearance lamp on a vehicle 2032 mm or more in overall width) is combined with a rear turn signal lamp and the maximum luminescent intensity of the taillamp (or clearance lamp) is located below horizontal and within an area generated by a 0.5° radius around a test point (1.0° radius on lamps installed on a vehicle 2032 mm or more in overall width), the ratio for the test point may be computed by using the lowest value of the taillamp (or clearance lamp) luminescent intensity within the generated area.

\(^{1}\) The photometric intensity values between test points must not be less than the lower specified minimum value of the two closest adjacent test points on a horizontal or vertical line.

\(^{2}\) If the sum of intensity values for all points in the zone is not less than the specified total value for the zone, the measured intensity value for each individual test point is not required to meet the minimum value.

\(^{3}\) Where taillamps are mounted with their axis of reference less than 750 mm above the road surface, photometry requirements below 5° down may be met at 5° down rather than at the specified required downward angle.

\(^{4}\) A taillamp shall not exceed the maximum intensity over any area larger than that generated by a 0.25° radius, within a solid cone angle from 20°L to 20°R and from H to 10°U.

(1) Where a side marker lamp installed on a motor vehicle less than 30 feet in overall length and less than 80 inches (2 m) in overall width has the lateral angle nearest the other required side marker lamp on the same side of the vehicle reduced from 45° by design as specified by S7.4.13.2, the photometric intensity measurement may be met at the lesser angle.

(2) The measured values at each test point must not be less than 60% of the minimum value.

(3) The photometric intensity values between test points must not be less than the lower specified minimum value of the two closest adjacent test points on a horizontal or vertical line.

(4) The maximum photometric intensity must not occur over any area larger than that generated by a 0.5° radius within a solid angle defined by the test point range.

(5) Where stop lamps are mounted with their axis of reference less than 750 mm above the road surface, photometry requirements below 5° down may be met at 5° down rather than at the specified required downward angle.

(6) When a taillamp is combined with a stop lamp and the maximum luminous intensity of the taillamp is located below horizontal and within an area generated by a 0.5° radius around a test point (1.0° radius on lamps installed on a vehicle 2032 mm or more in overall width), the ratio for the test point may be computed by using the lowest value of the taillamp luminous intensity within the generated area.

(7) Values preceded by a slash (/) apply only to lamps installed on multipurpose passenger vehicles, trucks, trailers, and busses of 2032 mm or more in overall width.
§ 571.108, Nt.

(1) The photometric intensity values between test points must not be less than the lower specified minimum value of the two closest adjacent test points on a horizontal or vertical line.

(2) Where side marker lamps are mounted with their axis of reference less than 750 mm above the road surface, photometry requirements below 5° down may be met at 5° down rather than at the specified required downward angle.

</table>

(1) Where clearance lamps or identification lamps are mounted with their axis of reference less than 750 mm above the road surface, photometry requirements below 5° down may be met at 5° down rather than at the specified required downward angle.

(2) The photometric intensity values between test points must not be less than the lower specified minimum value of the two closest adjacent test points on a horizontal or vertical line.

(3) When optically combined with a stop lamp or turn signal lamp, this maximum applies on or above the horizontal.

(4) Where clearance lamps are installed at locations other than on the front and rear due to the necessity to indicate the overall width of the vehicle, or for protection from damage during normal operation of the vehicle, they need not meet the photometric intensity requirement at any test point that is 45° inboard.

(1) The photometric intensity values between test points must not be less than the lower specified minimum value of the two closest adjacent test points on a horizontal or vertical line.

(2) When two lamps of the same or symmetrically opposite design are used, the tested photometric values along the vertical axis and the averages of the tested photometric values for the same horizontal test point left and right of vertical for one lamp must be used to determine compliance with the requirements.

(3) When two lamps of differing designs are used, they must be tested individually and the tested photometric values added to determine the combined units compliance with twice the stated requirements.

(4) If the sum of intensity values for all points in the zone is not less than the specified total value for the zone, the measured intensity value for each individual test point is not required to meet the minimum value.

**Notes:**
1. The measured values at each test point must not be less than 60% of the minimum value.
2. The photometric intensity values between test points must not be less than the lower specified minimum value of the two closest adjacent test points on a horizontal or vertical line.
3. The maximum photometric intensity must not exceed any area larger than that generated by a 0.5° radius within a solid angle defined by the test point range.
4. Where turn signal lamps are mounted with their axis of reference less than 750 mm above the road surface, photometry requirements below five degrees may be met at 5° down rather than at the specified required downward angle.
5. When a tail lamp is combined with a rear turn signal lamp and the maximum luminous intensity of the tail lamp is located below horizontal and within an area generated by a 0.5° radius around a test point the ratio for the test point may be computed by using the lowest value of the tail lamp luminous intensity within the generated area.

§ 571.109 Standard No. 109; New pneumatic and certain specialty tires.

S1. Scope. This standard specifies tire dimensions and laboratory test requirements for bead unseating resistance, strength, endurance, and high speed performance; defines tire load ratings; and specifies labeling requirements for passenger car tires.

S2. Application. This standard applies to new pneumatic radial tires for use on passenger cars manufactured before 1975, new pneumatic bias ply tires, T-type spare tires, ST, F1, and 8–12 rim diameter and below tires for use on passenger cars manufactured after 1948. However, it does not apply to any tire that has been so altered so as to render impossible its use, or its repair for use, as motor vehicle equipment.

S3. Definitions.

Bead means that part of the tire made of steel wires, wrapped or reinforced by ply cords, that is shaped to fit the rim.

Bead separation means a breakdown of bond between components in the bead area.

Bias ply tire means a pneumatic tire in which the ply cords that extend to the beads are laid at alternate angles substantially less than 90° to the centerline of the tread.

Carcass means the tire structure, except tread and sidewall rubber.
Chunking means the breaking away of pieces of the tread or sidewall.

Cord means the strands forming the plies in the tire.

Cord separation means cords parting away from adjacent rubber compounds.

Cracking means any parting within the tread, sidewall, or innerliner of the tire extending to cord material.

CT means a pneumatic tire with an inverted flange tire and rim system in which the rim is designed with rim flanges pointed radially inward and the tire is designed to fit on the underside of the rim in a manner that encloses the rim flanges inside the air cavity of the tire.

Groove means the space between two adjacent tread ribs.

Innerliner means the layer(s) forming the inside surface of a tubeless tire that contains the inflating medium within the tire.

Innerliner separation means the parting of the innerliner from cord material in the carcass.

Load rating means the maximum load a tire is rated to carry for a given inflation pressure.

Maximum permissible inflation pressure means the maximum cold inflation pressure to which a tire may be inflated.

Maximum load rating means the load rating at the maximum permissible inflation pressure for that tire.

Open splice means any parting at any junction of tread, sidewall, or innerliner that extends to cord material.

Overall width means the linear distance between the exteriors of the sidewalls of an inflated tire, including elevations due to labeling, decorations, or protective bands or ribs.

Ply means a layer of rubber-coated parallel cords.

Ply separation means a parting of rubber compound between adjacent plies.

Pneumatic tire means a mechanical device made of rubber, chemicals, fabric and steel or other materials, which, when mounted on an automotive wheel, provides the traction and contains the gas or fluid that sustains the load.

Radial ply tire means a pneumatic tire in which the ply cords which extend to the beads are laid at substantially 90° to the centerline of the tread.

Rim means a metal support for a tire or a tire and tube assembly upon which the tire beads are seated.

Section width means the linear distance between the exteriors of the sidewalls of an inflated tire, excluding elevations due to labeling, decoration, or protective bands.

Sidewall means that portion of a tire between the tread and the bead.

Sidewall separation means the parting of the rubber compound from the cord material in the sidewall.

Test rim means, with reference to a tire to be tested, any rim that is listed as appropriate for use with that tire in accordance with §4.4. For purposes of this section and §571.110, each rim listing shall include dimensional specifications and a diagram of the rim.

Tread means that portion of a tire that comes into contact with the road. Tread rib means a tread section running circumferentially around a tire.

Tread separation means pulling away of the tread from the tire carcass.
§ 571.109 49 CFR Ch. V (10–1–08 Edition)

the published maximum load rating, or if there are differing maximum load ratings for the same tire size designation, not less than the lowest published maximum load rating.

(d) It shall incorporate a tread wear indicator that will provide a visual indication that the tire has worn to a tread depth of 1.6 mm (1/16 inch).

(e) It shall, before being subjected to either the endurance test procedure specified in S5.4 or the high speed performance procedure specified in S5.5, exhibit no visual evidence of tread, sidewall, ply, cord, innerliner, or bead separation, chunking, broken cords, cracking, or open splices.

(f) It shall meet the requirements of S4.2.2.5 and S4.2.2.6 when tested on a test wheel described in S5.4.2.1 either alone or simultaneously with up to 5 other tires.

S4.2.2 Test requirements.
S4.2.2.1 Test sample. For each test sample use:
(a) One tire for physical dimensions, resistance to bead unseating, and strength, in sequence;
(b) Another tire for tire endurance; and
(c) A third tire for high speed performance.

S4.2.2.2 Physical dimensions. The actual section width and overall width for each tire measured in accordance with S5.1, shall not exceed the section width specified in a submission made by an individual manufacturer, pursuant to S4.4.1(a) or in one of the publications described in S4.4.1(b) for its size designation and type by more than:
(a) (For tires with a maximum permissible inflation pressure of 32, 36, or 40 psi) 7 percent, or
(b) (For tires with a maximum permissible inflation pressure of 240, 280, 290, 300, 330, 350 or 390 kPa, or 60 psi) 7 percent or 10 mm (0.4 inches), whichever is larger.

S4.2.2.3 Tubeless tire resistance to bead unseating.
S4.2.2.3.1 When a tubeless tire that has a maximum inflation pressure other than 420 kPa (60 psi) is tested in accordance with S5.2, the applied force required to unseat the tire bead at the point of contact shall be not less than:
(a) 6,670 N (1,500 pounds) for tires with a designated section width of less than 160 mm (6 inches);
(b) 8,890 N (2,000 pounds) for tires with a designated section width of 160 mm (6 inches) or more but less than 205 mm (8 inches);
(c) 11,120 N (2,500 pounds) for tires with a designated section width of 205 mm (8 inches) or more, using the section width specified in a submission made by an individual manufacturer, pursuant to S4.4.1(a), or in one of the publications described in S4.4.1(b) for the applicable tire size designation and type.

S4.2.2.3.2 When a tire that has a maximum inflation pressure of 420 kPa (60 psi) is tested in accordance with S5.2, the applied force required to unseat the bead at the point of contact shall be not less than:
(a) 6,670 N (1,500 pounds) for tires with a maximum load rating of less than 399 kg (880 pounds);
(b) 8,890 N (2,000 pounds) for tires with a maximum load rating of 399 kg (880 pounds) or more but less than 635 kg (1,400 pounds);
(c) 11,120 N (2,500 pounds) for tires with a maximum load rating of 635 kg (1,400 pounds) or more, using the maximum load rating marked on the sidewall of the tire.

S4.2.2.4 Tire strength. Each tire shall meet the requirements for minimum breaking energy specified in Table 1 when tested in accordance with S5.3.

S4.2.2.5 Tire endurance. When the tire has been subjected to the laboratory endurance test specified in S5.4, using a test rim that undergoes no permanent deformation and allows no loss of air through the portion that it comprises of the tire-rim pressure chamber:
(a) There shall be no visual evidence of tread, sidewall, ply, cord, innerliner, or bead separation, chunking, broken cords, cracking, or open splices.
(b) The tire pressure at the end of the test shall be not less than the initial pressures specified in S5.4.1.1.

S4.2.2.6 High speed performance. When the tire has been subjected to the laboratory high speed performance test specified in S5.5, using a test rim that undergoes no permanent deformation and allows no loss of air through the portion that it comprises of the tire-
rim pressure chamber, the tire shall meet the requirements set forth in S4.2.2.5 (a) and (b).

§4.3 Labeling Requirements. Except as provided in S4.3.1 and S4.3.2 of this standard, each tire, except for those certified to comply with §571.139, shall have permanently molded into or onto both sidewalls, in letters and numerals not less than 0.078 inches high, the information shown in paragraphs §4.3 (a) through (g) of this standard. On at least one sidewall, the information shall be positioned in an area between the maximum section width and bead of the tire, unless the maximum section width of the tire falls between the bead and one-fourth of the distance from the bead to the shoulder of the tire. For tires where the maximum section width falls in that area, locate all required labeling between the bead and a point one-half the distance from the bead to the shoulder of the tire. However, in no case shall the information be positioned on the tire so that it is obstructed by the flange or any rim designated for use with that tire in Standards Nos. 109 and 110 (Sec. 571.109 and Sec. 571.110 of this part).

(a) One size designation, except that equivalent inch and metric size designations may be used;
(b) Maximum permissible inflation pressure;
(c) Maximum load rating;
(d) The generic name of each cord material used in the plies (both sidewall and tread area) of the tire;
(e) Actual number of plies in the sidewall, and the actual number of plies in the tread area if different;
(f) The words “tubeless” or “tube type” as applicable; and
(g) The word “radial” if the tire is a radial ply tire.

§4.3.1 Each tire shall be labeled with the symbol DOT in the manner specified in part 574 of this chapter, which shall constitute a certification that the tire conforms to applicable Federal motor vehicle safety standards.

§4.3.2 Each tire shall be labeled with the name of the manufacturer, or brand name and number assigned to the manufacturer in the manner specified in part 574.

§4.3.3 [Reserved]

§4.3.4 If the maximum inflation pressure of a tire is 240, 280, 290, 300, 330, 340, 350, or 390 kPa, then:
(a) Each marking of that inflation pressure pursuant to §4.3(b) shall be followed in parenthesis by the equivalent inflation pressure in psi, rounded to the next higher whole number; and
(b) Each marking of the tire’s maximum load rating pursuant to §4.3(c) in kilograms shall be followed in parenthesis by the equivalent load rating in pounds, rounded to the nearest whole number.

§4.3.5 If the maximum inflation pressure of a tire is 420 kPa (60 psi), the tire shall have permanently molded into or onto both sidewalls, in letters and numerals not less than 12.7 mm (½ inch), the words “Inflate to 420 kPa (60 psi)”. On both sidewalls, the words shall be positioned in an area between the tire shoulder and the bead of the tire. However, in no case shall the words be positioned on the tire so that they are obstructed by the flange of any rim designated for use with that tire in this standard or in Standard No. 110 (§571.110 of this part).

§4.4 Tire and rim matching information.

§4.4.1 Each manufacturer of tires not certified to comply with §4 of §571.139 shall ensure that a listing of the rims that may be used with each tire that he produces is provided to the public. A listing compiled in accordance with paragraph (a) of §4.4.1 of this standard need not include dimensional specifications or diagram of a rim if the rim’s dimensional specifications and diagram are contained in each listing published in accordance with paragraph (b) of §4.4.1 of this standard. The listing shall be in one of the following forms:
(a) Listed by manufacturer name or brand name in a document furnished to dealers of the manufacturer’s tires, to any person upon request, and in duplicate to the Docket Section, National Highway Traffic Safety Administration, 400 Seventh Street SW., Washington, DC 20590; or
(b) Contained in publications, current at the date of manufacture of the tire or any later date, of at least one of the following organizations:
§571.109

The Tire and Rim Association
The European Tyre and Rim Technical Organisation
Japan Automobile Tire Manufacturers’ Association, Inc.
Deutsche Industrie Norm
British Standards Institution
Scandinavian Tire and Rim Organization
The Tyre and Rim Association of Australia

S4.4.2 Information contained in any publication specified in S4.4.1(b) of this standard which lists general categories of tires and rims by size designation, type of construction and/or intended use, shall be considered to be manufacturer’s information pursuant to S4.4.1 of this standard for the listed tires and rims, unless the publication itself or specific information provided according to S4.4.1(a) of this standard indicates otherwise.

S5. Test procedures.

S5.1 Physical Dimensions. Determine tire physical dimensions under uniform ambient conditions as follows:
(a) Mount the tire on a test rim having the test rim width specified in a submission made by an individual manufacturer, pursuant to S4.4.1(a), or in one of the publications described in S4.4.1(b) for that tire size designation and inflate it to the applicable pressure specified in Table II.
(b) Condition it at ambient room temperature for at least 24 hours.
(c) Readjust pressure to that specified in (a).
(d) Caliper the section width and overall width at six points approximately equally spaced around the tire circumference.
(e) Record the average of these measurements as the section width and overall width, respectively.
(f) Determine tire outer diameter by measuring the maximum circumference of the tire and dividing this dimension by pi (3.14).

S5.2 Tubeless tire bead unseating resistance.

S5.2.1 Preparation of tire-wheel assembly.

S5.2.1.1 Wash the tire, dry it at the beads, and mount it without lubrication or adhesives on a clean, painted test rim.
S5.2.1.2 Inflate it to the applicable pressure specified in Table II at ambient room temperature.

S5.2.1.3 Mount the wheel and tire in a fixture shown in Figure 1, and force the bead unseating block shown in Figure 2 or Figure 2A against the tire sidewall as required by the geometry of the fixture. However, in testing a tire that has an inflation pressure of 60 psi, only use the bead unseating block described in Figure 2A.

S5.2.2 Test procedure.

S5.2.2.1 Apply a load through the block to the tire’s outer sidewall at the distance specified in Figure 1 for the applicable wheel size at a rate of 50 mm (2 inches) per minute, with the load arm substantially parallel to the tire and rim assembly at the time of engagement.
S5.2.2.2 Increase the load until the bead unseats or the applicable value specified in S4.2.2.3 is reached.
S5.2.2.3 Repeat the test at least four places equally spaced around the tire circumference.

S5.3 Tire strength.

S5.3.1 Preparation of tire.

S5.3.1.1 Mount the tire on a test rim and inflate it to the applicable pressure specified in Table II.
S5.3.1.2 Condition it at room temperature for at least 3 hours; and
S5.3.1.3 Readjust its pressure to that specified in S5.3.1.1.

S5.3.2 Test procedure.

S5.3.2.1 Force a 19 mm (3/4 inch) diameter cylindrical steel plunger with a hemispherical end perpendicularly into the tread rib as near to the centerline as possible, avoiding penetration into the tread groove, at the rate of 50 mm (2 inches) per minute.
S5.3.2.2 Record the force and penetration at five test points equally spaced around the circumference of the tire. If the tire fails to break before the plunger is stopped by reaching the rim, record the force and penetration as the rim is reached and use these values in S5.3.2.3.
S5.3.2.3 Compute the breaking energy for each test point by means of one of the two following formulas:

\[ W = \frac{[(F \times P) / 2] \times 10^{-3}}{} \] (joules)

Where
W=Energy, in joules;
F=Force, Newtons; and
P=Penetration, mm; or
W=\([(F \times P) / 2]\)
§ 571.109

487

Where

\[ \text{W}=\text{Energy, inch-pounds}; \]
\[ \text{F}=\text{Force, pounds}; \text{ and} \]
\[ \text{P}=\text{Penetration, inches}. \]

S5.3.2.4 Determine the breaking energy value for the tire by computing the average of the five values obtained in accordance with S5.3.2.3.

S5.4 Tire endurance.

S5.4.1 Preparation of tire.

S5.4.1.1 Mount a new tire on a test rim and inflate it to the applicable pressure specified in Table II.

S5.4.1.2 Condition the tire assembly to 38° ± 3°C (100° ±5°F) for at least three hours.

S5.4.1.3 Readjust tire pressure to that specified in S5.4.1.1 immediately before testing.

S5.4.2 Test procedure.

S5.4.2.1 Mount the tire and wheel assembly on a test axle and press it against a flat-faced steel test wheel 1708 mm (67.23 inches) in diameter and at least as wide as the section width of the tire to be tested or an approved equivalent test wheel, with the applicable test load specified in the table in S5.4.2.3 for the tire’s size designation, type and maximum permissible inflation pressure.

S5.4.2.2 During the test, the air surrounding the test area shall be 38° ± 3°C (100° ±5°F).

S5.4.2.3 Conduct the test at 80 kilometers per hour (50 miles per hour) in accordance with the following schedule without pressure adjustment or other interruptions:

The loads for the following periods are the specified percentage of the maximum load rating marked on the tire sidewall:

<table>
<thead>
<tr>
<th>Percent</th>
<th>Percent</th>

<td>4 hours</td>
<td>85</td>
</tr>
<tr>
<td>6 hours</td>
<td>90</td>
</tr>
<tr>
<td>24 hours</td>
<td>100</td>
</tr>
</tbody>
</table>

S5.4.2.4 Immediately after running the tire the required time, measure its inflation pressure. Allow the tire to cool for one hour. Then deflate the tire, remove it from the test rim, and inspect it for the conditions specified in S4.2.2.5(a).

S5.5 High speed performance.

S5.5.1 After preparing the tire in accordance with S5.4.1, mount the tire and wheel assembly in accordance with S5.4.2.1, and press it against the test wheel with a load of 88 percent of the tire's maximum load rating as marked on the tire sidewall.

S5.5.2 Break in the tire by running it for 2 hours at 80 km/h (50 mph).

S5.5.3 Allow to cool to 38° ± 3°C (100° ±5°F) and readjust the inflation pressure to the applicable pressure specified in Table II.

S5.5.4 Without readjusting inflation pressure, test at 121 km/h (75 mph) for 30 minutes, 129 km/h (80 mph) for 30 minutes, and 137 km/h (85 mph) for 30 minutes.

S5.5.5 Immediately after running the tire the required time, measure its inflation pressure. Allow the tire to cool for one hour. Then deflate the tire, remove it from the test rim, and inspect it for the conditions specified in S4.2.2.5(a).

S6. Nonconforming tires. No tire that is designed for use on passenger cars and manufactured on or after October 1, 1972, but does not conform to all the requirements of this standard, shall be sold, offered for sale, introduced or delivered for introduction into interstate commerce, or imported into the United States, for any purpose.

Appendix A—Federal Motor Vehicle Safety Standard No. 109

The following tables list tire sizes and tire constructions with proper load and inflation values. The tables group tires of related constructions and load/inflation values. Persons requesting the addition of new tire sizes to the tables or the addition of tables for new tire constructions may, when the additions requested are compatible with existent groupings, or when adequate justification for new tables exists, submit five (5) copies of information and data supporting the request to...
The Vehicle Dynamics Division, Office of Crash Avoidance Standards, National Highway Traffic Safety Administration, 400 Seventh Street SW., Washington, DC 20590.

The information should contain the following:
1. The tire size designation, and a statement either that the tire is an addition to a category of tires listed in the tables or that it is in a new category for which a table has not been developed.
2. The tire dimensions, including aspect ratio, size factor, section width, overall width, and test rim size.
3. The load-inflation schedule of the tire.

4. A statement as to whether the tire size designation and load inflation schedule has been coordinated with the Tire and Rim Association, the European Tyre and Rim Technical Organisation, the Japan Automobile Tire Manufacturers' Association, Inc., the Deutsche Industrie Norm, the British Standards Institution, the Scandinavian Tire and Rim Organization, and the Tyre and Rim Association of Australia.
5. Copies of test data sheets showing test conditions, results and conclusions obtained for individual tests specified in §571.109.
6. Justification for the additional tire sizes.

§ 571.110 Tire selection and rims and motor home/recreation vehicle trailer load carrying capacity information for motor vehicles with a GVWR of 4,536 kilograms (10,000 pounds) or less.

S1. Purpose and scope. This standard specifies requirements for tire selection to prevent tire overloading and for motor home/recreation vehicle trailer load carrying capacity information.

S2. Application. This standard applies to motor vehicles with a gross vehicle weight rating (GVWR) of 4,536 kilograms (10,000 pounds) or less, except for motorcycles, and to non-pneumatic spare tire assemblies for those vehicles.

S3. Definitions.

Accessory weight means the combined weight (in excess of those standard items which may be replaced) of automatic transmission, power steering, power brakes, power windows, power seats, radio, and heater, to the extent that these items are available as factory-installed equipment (whether installed or not).

Curb weight means the weight of a motor vehicle with standard equipment including the maximum capacity of fuel, oil, and coolant, and, if so equipped, air conditioning and additional weight optional engine.

Maximum loaded vehicle weight means the sum of—
(a) Curb weight;
(b) Accessory weight;
(c) Vehicle capacity weight; and
(d) Production options weight.

Light truck (LT) tire means a tire designated by its manufacturer as primarily intended for use on lightweight trucks or multipurpose passenger vehicles.

Non-pneumatic rim is used as defined in §571.129.

Non-pneumatic spare tire assembly means a non-pneumatic tire assembly intended for temporary use in place of one of the pneumatic tires and rims that are fitted to a passenger car in compliance with the requirements of this standard.

Non-pneumatic tire and non-pneumatic tire assembly are used as defined in §571.129.

Normal occupant weight means 68 kilograms times the number of occupants specified in the second column of Table I.

Occupant distribution means distribution of occupants in a vehicle as specified in the third column of Table I.

Passenger car tire means a tire intended for use on passenger cars, multipurpose passenger vehicles, and trucks, that have a gross vehicle weight rating of 4,536 kilograms (10,000 pounds) or less.
§ 571.110

weight rating (GVWR) of 10,000 pounds or less.

Production options weight means the combined weight of those installed regular production options weighing over 2.3 kilograms in excess of those standard items which they replace, not previously considered in curb weight or accessory weight, including heavy duty brakes, ride levelers, roof rack, heavy duty battery, and special trim.

Rim is used as defined in §571.109.

Rim diameter means nominal diameter of the bead seat.

Rim size designation means rim diameter and width.

Rim type designation means the industry of manufacturer's designation for a rim by style or code.

Rim width means nominal distance between rim flanges.

Vehicle capacity weight means the rated cargo and luggage load plus 68 kilograms times the vehicle's designated seating capacity.

Vehicle maximum load on the tire means that load on an individual tire that is determined by distributing to each axle its share of the maximum loaded vehicle weight and dividing by two.

Vehicle normal load on the tire means that load on an individual tire that is determined by distributing to each axle its share of the curb weight, accessory weight, and normal occupant weight (distributed in accordance with Table I) and dividing by 2.

Wheel center member is used as defined in §571.129.

S4. Requirements.

S4.1 General. Vehicles shall be equipped with tires that meet the requirements of §571.139. New pneumatic tires for light vehicles, except that passenger cars may be equipped with a pneumatic T-type temporary spare tire assembly that meets the requirements of §571.109, or equipped with a non-pneumatic spare tire assembly that meets the requirements of §571.129.

New non-pneumatic tires for passenger cars, and S6 and S8 of this standard. Passenger cars equipped with a non-pneumatic spare tire assembly shall meet the requirements of S4.3(e), and S5, and S7 of this standard.

S4.2 Tire load limits.

S4.2.1 Tire load limits for passenger cars.

S4.2.1.1 The vehicle maximum load on the tire shall not be greater than the applicable maximum load rating as marked on the sidewall of the tire.

S4.2.1.2 The vehicle normal load on the tire shall not be greater than 94 percent of the load rating at the vehicle manufacturer's recommended cold inflation pressure for that tire.

S4.2.2 Tire load limits for multipurpose passenger vehicles, trucks, buses, and trailers.

S4.2.2.1 Except as provided in S4.2.2.2, the sum of the maximum load ratings of the tires fitted to an axle shall not be less than the GAWR of the axle system as specified on the vehicle's certification label required by 49 CFR part 567. If the certification label shows more than one GAWR for the axle system, the sum shall be not less than the GAWR corresponding to the size designation of the tires fitted to the axle.

S4.2.2.2 When passenger car tires are installed on an MPV, truck, bus, or trailer, each tire's load rating is reduced by dividing it by 1.10 before determining, under S4.2.2.1, the sum of the maximum load ratings of the tires fitted to an axle.

S4.2.2.3 (a) For vehicles, except trailers with no designated seating positions, equipped with passenger car tires, the vehicle normal load on the tire shall be no greater than 94 percent of the derated load rating at the vehicle manufacturer's recommended cold inflation pressure for that tire.

(b) For vehicles, except trailers with no designated seating positions, equipped with LT tires, the vehicle normal load on the tire shall be no greater than 94 percent of the load rating at the vehicle manufacturer's recommended cold inflation pressure for that tire.

S4.3 Placard. Each vehicle, except for a trailer or incomplete vehicle, shall show the information specified in S4.3 (a) through (g), and may show, at the manufacturer's option, the information specified in S4.3 (h) and (i), on a placard permanently affixed to the driver's side B-pillar. In each vehicle without a driver's side B-pillar and with two doors on the driver's side of
§ 571.110 49 CFR Ch. V (10–1–08 Edition)

the vehicle opening in opposite directions, the placard shall be affixed on the forward edge of the rear side door. If the above locations do not permit the affixing of a placard that is legible, visible and prominent, the placard shall be permanently affixed to the rear edge of the driver’s side door. If this location does not permit the affixing of a placard that is legible, visible and prominent, the placard shall be affixed to the inward facing surface of the vehicle next to the driver’s seating position. This information shall be in the English language and conform in color and format, not including the border surrounding the entire placard, as shown in the example set forth in Figure 1 in this standard. At the manufacturer’s option, the information specified in §4.3 (c), (d), and, as appropriate, (h) and (i) may be shown, alternatively to being shown on the placard, on a tire inflation pressure label which must conform in color and format, not including the border surrounding the entire label, as shown in the example set forth in Figure 2 in this standard. The label shall be permanently affixed and proximate to the placard required by this paragraph. The information specified in §4.3 (e) shall be shown on both the vehicle placard and on the tire inflation pressure label (if such a label is affixed to provide the information specified in §4.3 (c), (d), and, as appropriate, (h) and (i)) may be shown in the format and color scheme set forth in Figures 1 and 2. If the vehicle is a motor home and is equipped with a propane supply, the weight of full propane tanks must be included in the vehicle’s unloaded vehicle weight. If the vehicle is a motor home and is equipped with an on-board potable water supply, the weight of such on-board water must be treated as cargo.

(a) Vehicle capacity weight expressed as “The combined weight of occupants and cargo should never exceed XXX kilograms or XXX pounds”;
(b) Designated seated capacity (expressed in terms of total number of occupants and number of occupants for each front and rear seat location);
(c) Vehicle manufacturer’s recommended cold tire inflation pressure for front, rear and spare tires, subject to the limitations of §4.3.4. For full size spare tires, the statement “see above” may, at the manufacturer’s option replace manufacturer’s recommended cold tire inflation pressure. If no spare tire is provided, the word “none” must replace the manufacturer’s recommended cold tire inflation pressure.

(d) Tire size designation, indicated by the headings “size” or “original tire size” or “original size,” and “spare tire” or “spare,” for the tires installed at the time of the first purchase for purposes other than resale. For full size spare tires, the statement “see above” may, at the manufacturer’s option replace the tire size designation. If no spare tire is provided, the word “none” must replace the tire size designation;
(e) On the vehicle placard, “Tire and Loading Information and, on the tire inflation pressure label, “Tire Information”;
(f) “See Owner’s Manual for Additional Information”;
(g) For a vehicle equipped with a non-pneumatic spare tire assembly, the tire identification code with which that assembly is labeled pursuant to the requirements of §4.3(a) of 571.129, New Non-Pneumatic Tires for Passenger Cars;
(h) At the manufacturer’s option, identifying information provided in any alphanumeric and or barcode form, located vertically, along the right edge or the left edge of the placard or the label, or horizontally, along the bottom edge of the placard or the label; and
(i) At the manufacturer’s option, the load range identification symbol, load index, and speed rating, located immediately to the right of the tire size designation listed in accordance with §4.3(d) above.

§4.3.1 Requirements for vehicles manufactured in two or more stages. A placard or placard and label shall be affixed to the completed vehicle by the final-stage manufacturer in accordance with §4.3 and with the vehicle capacity weight and seating designations as finally manufactured.

§4.3.2 Requirements for altered vehicles. Except as provided in S10, a new
placard or placard and label shall be affixed, so as to obscure the original placard, to an altered vehicle that has previously been certified in accordance with §567.4 or §567.5, other than by the addition, substitution, or removal of readily attachable components such as mirrors or tire and rim assemblies, or minor finishing operations such as painting, or who alters the vehicle in such a manner that its stated weight ratings are no longer valid, before the first purchase of the vehicle in good faith for purposes other than resale, containing accurate information for the altered vehicle, in accordance with §4.3.

§4.3.3 Additional labeling information for vehicles other than passenger cars. Each vehicle shall show the size designation and, if applicable, the type designation of rims (not necessarily those on the vehicle) appropriate for the tire appropriate for use on that vehicle, including the tire installed as original equipment on the vehicle by the vehicle manufacturer, after each GAWR listed on the certification label required by §567.4 or §567.5 of this chapter. This information shall be in the English language, lettered in block capitals and numerals not less than 2.4 millimeters high and in the following format:

Truck Example—Suitable Tire-Rim Choice
GVWR: 2,441 kilograms (5381 pounds).
GAWR: Front—1,299 kilograms (2,864 pounds) with P265/70R16 tires, 16 × 8.0 rims, at 248 kPa (36 psi) cold single.
GAWR: Rear—1,299 kilograms (2,864 pounds) with P265/70R16 tires, 16 × 8.00 rims, at 248 kPa (36 psi) cold single.

§4.3.4 No inflation pressure other than the maximum permissible inflation pressure may be shown on the placard and, if any, tire inflation pressure label unless—
(a) It is less than the maximum permissible inflation pressure;
(b) It is appropriate for the load limits as calculated in accordance with §4.2; and
(c) The tire load rating specified in a submission by an individual manufacturer, pursuant to §4.1.1(a) of §571.139 or contained in one of the publications described in §4.1.1(b) of §571.139, for the tire size at that inflation pressure is not less than the vehicle maximum load and the vehicle normal load on the tire for those vehicle loading conditions.

§4.3.5 Requirements for trailers. Each trailer, except for an incomplete vehicle, must show the information specified in §4.3 (c) through (g), and may show the information specified in §4.3 (h) and (i), on a placard permanently affixed proximate to the certification label specified in 49 CFR part 567. Additionally, each trailer must on its placard contain a cargo capacity statement expressed as “The weight of cargo should never exceed XXX kilograms or XXX pounds” in the same location on the placard specified for the “vehicle capacity weight” statement required by this standard. At the manufacturer’s option, the information specified in §4.3 (c), (d), (h) and (i) may be shown, alternatively, on a tire inflation pressure label, and conform in color and format, not including the border surrounding the entire label, as specified in the example set forth in Figure 2 in this standard. The label shall be permanently affixed and proximate to the placard required by this paragraph. The information specified in §4.3 (e) shall be shown on both the vehicle placard and on the tire inflation pressure label (if such a label is affixed to provide the information specified in §4.3 (c), (d), (h) and (i)) in the format and color scheme set forth in Figures 1 and 2. If the vehicle is a recreation vehicle trailer and is equipped with a propane supply, the weight of full propane tanks must be included in the vehicle’s unloaded vehicle weight. If the vehicle is a recreation vehicle trailer and is equipped with an on-board potable water supply, the weight of such on-board water must be treated as cargo.

§4.4 Rims.
§4.4.1 Requirements. Each rim shall:
(a) Be constructed to the dimensions of a rim that is listed by the manufacturer of the tires as suitable for use with those tires, in accordance with §4 of §571.139.
(b) In the event of rapid loss of inflation pressure with the vehicle traveling in a straight line at a speed of 97 kilometers per hour, retain the deflated
§ 571.110

49 CFR Ch. V (10–1–08 Edition)

tire until the vehicle can be stopped with a controlled braking application.

S4.4.2. Rim markings for vehicles other than passenger cars. Each rim or, at the option of the manufacturer in the case of a single-piece wheel, each wheel disc shall be marked with the information listed in S4.4.2 (a) through (e), in lettering not less than 3 millimeters in height, impressed to a depth or, at the option of the manufacturer, embossed to a height of not less than 0.125 millimeters. The information listed in S4.4.2 (a) through (c) shall appear on the outward side. In the case of rims of multi piece construction, the information listed in S4.4.2 (a) through (e) shall appear on the rim base and the information listed in S4.4.2 (b) and (d) shall also appear on each other part of the rim.

(a) A designation that indicates the source of the rim’s published nominal dimensions, as follows:
(1) “T” indicates The Tire and Rim Association.
(2) “E” indicates The European Tyre and Rim Technical Organization.
(3) “J” indicates Japan Automobile Tire Manufacturers’ Association, Inc.
(4) “L” indicates ABPA (Brazil), a.k.a. Associacao Latino Americana De Pneus E Aros.
(5) “P” indicates Tire and Rim Engineering Data Committee of South Africa (Tredco).
(6) “S” indicates Scandinavian Tire and Rim Organization (STRO).
(7) “A” indicates The Tyre and Rim Association of Australia.
(8) “I” indicates Indian Tyre Technical Advisory Committee (ITTAC).

(9) “R” indicates Argentine Institute of Rationalization of Materials, a.k.a. Instituto Argentino de Racionalización de Materiales, (ARAM).
(10) “N” indicates an independent listing pursuant to § 5.1(a) of § 571.119.
(b) The rim size designation, and in case of multipiece rims, the rim type designation. For example: 20 x 5.50, or 20 x 5.5.
(c) The symbol DOT, constituting a certification by the manufacturer of the rim that the rim complies with all applicable Federal motor vehicle safety standards.
(d) A designation that identifies the manufacturer of the rim by name, trademark, or symbol.
(e) The month, day and year or the month and year of manufacture, expressed either numerically or by use of a symbol, at the option of the manufacturer. For example: “September 4, 2001” may be expressed numerically as: “09/04/01”, “904, 01” or “01, 904”; “September 2001” may be expressed as: “09/01”, “09, 01” or “01, 9”.

(1) Any manufacturer that elects to express the date of manufacture by means of a symbol shall notify NHTSA in writing of the full names and addresses of all manufacturers and brand name owners utilizing that symbol and the name and address of the trademark owner of that symbol, if any. The notification shall describe in narrative form and in detail how the month, day, and year or the month and year are depicted by the symbol. Such description shall include an actual size graphic depiction of the symbol, showing and/or explaining the interrelationship of the component parts of the symbol as they will appear on the rim or single piece wheel disc, including dimensional specifications, and where the symbol will be located on the rim or single piece wheel disc. The notification shall be received by NHTSA not less than 60 calendar days before the first use of the symbol. The notification shall be mailed to the Office of Vehicle Safety Compliance (NVS–222), National Highway Traffic Safety Administration, 400 Seventh Street SW., Washington, DC 20590. All information provided to NHTSA under this paragraph will be placed in the public docket.
(2) Each manufacturer of wheels shall provide an explanation of its date of manufacture symbol to any person upon request.

§ 571.110 Load Limits for Non-Pneumatic Spare Tires.

The highest vehicle maximum load on the tire for the vehicle shall not be greater than the load rating for the non-pneumatic spare tire.

§ 571.112 Labeling Requirements for Non-Pneumatic Spare Tires or Tire Assemblies.

Each non-pneumatic tire or, in the case of a non-pneumatic tire assembly in which the non-pneumatic tire is an integral part of the assembly, each non-pneumatic tire assembly shall include, in letters or numerals not less than 4 millimeters high, the information specified in paragraphs S6 (a) and (b). The information shall be permanently molded, stamped, or otherwise permanently marked into or onto the non-pneumatic tire or non-pneumatic tire assembly, or shall appear on a label that is permanently attached to the tire or tire assembly. If a label is used, it shall be subsurface printed, made of material that is resistant to fade, heat, moisture and abrasion, and attached in such a manner that it cannot be removed without destroying or defacing the label on the non-pneumatic tire or tire assembly. The information specified in paragraphs S6 (a) and (b) shall appear on both sides of the non-pneumatic tire or tire assembly, except, in the case of a non-pneumatic tire assembly which has a particular side that must always face outward when mounted on a vehicle, in which case the information specified in paragraphs S6 (a) and (b) shall only be required on the outward facing side. The information shall be positioned on the tire or tire assembly such that it is not placed on the tread or the outermost edge of the tire and is not obstructed by any portion of any non-pneumatic rim or wheel center member designated for use with that tire in this standard or in Standard No. 129.

(a) FOR TEMPORARY USE ONLY; and

(b) MAXIMUM 80 KM/H (50 M.P.H.).

§ 571.116 Supplementary Information. The owner’s manual of the passenger car shall contain, in writing in the English language and in not less than 10 point type, the following information under the heading “IMPORTANT—USE OF SPARE TIRE”:

(a) A statement indicating the information related to appropriate use for the non-pneumatic spare tire including at a minimum the information set forth in S6 (a) and (b) and either the information set forth in § 571.129 or a statement that the information set forth in § 571.129 is located on the vehicle placard and on the non-pneumatic tire;

(b) An instruction to drive carefully when the non-pneumatic spare tire is in use, and to install the proper pneumatic tire and rim at the first reasonable opportunity; and

(c) A statement that operation of the passenger car is not recommended with more than one non-pneumatic spare tire in use at the same time.

§ 571.121 Non-Pneumatic Rims and Wheel Center Members

§ 571.121.1 Non-Pneumatic Rim Requirements. Each non-pneumatic rim that is part of a separable non-pneumatic spare tire assembly shall be constructed to the dimensions of a non-pneumatic rim that is listed pursuant to § 571.129 for use with the non-pneumatic tire, designated by its non-pneumatic tire identification code, with which the vehicle is equipped.

§ 571.121.2 Wheel Center Member Requirements. Each wheel center member that is part of a separable non-pneumatic spare tire assembly shall be constructed to the dimensions of a wheel center member that is listed pursuant to § 571.129 for use with the non-pneumatic tire, designated by its non-pneumatic tire identification code, with which the vehicle is equipped.

* For trailers, this statement should read:
The weight of cargo should not exceed XXX kg or XXX lbs.

Figure 1
§ 571.110  Tire Inflation Pressure Label

S9. Each motor home and recreation vehicle (RV) trailer must meet the applicable requirements in S9.

S9.1 On motor homes, the sum of the gross axle weight ratings (GAWR) of all axles on the vehicle must not be less than the gross vehicle weight rating (GVWR).

S9.2 On RV trailers, the sum of the GAWRs of all axles on the vehicle plus the vehicle manufacturer's recommended tongue weight must not be less than the GVWR. If tongue weight is specified as a range, the minimum value must be used.

S9.3 Each motor home and RV trailer single stage or final stage manufacturer must affix either a motor home occupant and cargo carrying capacity (OCCC) label (Figure 3) or a RV trailer cargo carrying capacity (CCC) label (Figure 4) to its vehicles that meets the following criteria:

S9.3.1 The RV load carrying capacity labels (Figures 3 and 4) and the RV supplemental labels (Figures 5 and 6) required by S9.3.3(b) must be legible, visible, moisture resistant, presented in the English language, have a minimum print size of 2.4 millimeters (3/32 inches) high and be printed in black print on a yellow background.

S9.3.2 The weight value for load carrying capacity on the RV load carrying capacity labels (Figures 3 and 4) must be displayed to the nearest kilogram with conversion to the nearest pound and must be such that the vehicle does not exceed its GVWR when loaded with the stated load carrying capacity. The UVW and the GVWR used to determine the RV’s load carrying capacity must reflect the weights and design of the motor home or RV trailer as configured for delivery to the dealer/service facility. If applicable, the weight of full propane tanks must be included in the RV’s UVW and the weight of on-board potable water must be treated as cargo.

S9.3.3 An RV load carrying capacity label (Figures 3 or 4) must be:

(a) Permanently affixed and must be visibly located on the interior of the forward-most exterior passenger door.
§ 571.110 49 CFR Ch. V (10–1–08 Edition)

on the right side of the vehicle or; at
the option of the manufacturer.

(b) A temporary version of the RV load carrying capacity label (Figures 3 or 4) must be visibly located on the interior of the forward-most exterior passenger door on the right side of the vehicle. A permanent motor home or RV trailer supplemental label (Figures 5 or 6) must be permanently affixed within 25 millimeters of the placard specified in §4.3 for motor homes and §4.3.5 for RV trailers.

S9.3.4 Permanent and temporary motor home OCCC labels must contain the following information in accordance with Figure 3:

(a) The statement: “MOTOR HOME OCCUPANT AND CARGO CARRYING CAPACITY” in block letters.

(b) The Vehicle Identification Number (VIN).

(c) The statement “THE COMBINED WEIGHT OF OCCUPANTS AND CARGO SHOULD NEVER EXCEED: XXX kg or XXX lbs” in block letters with appropriate values included.

(d) The statement “Safety belt equipped seating capacity: XXX” with the appropriate value included. This is the total number of safety belt equipped seating positions.

(e) The statement “CAUTION: A full load of water equals XXX kg or XXX lbs of cargo @ 1 kg/L (8.3 lb/gal) and the tongue weight of a towed trailer counts as cargo” with appropriate values included.

S9.3.5 Permanent and temporary RV trailer CCC labels must contain the following information in accordance with Figure 4:

(a) The statement: “RECREATION VEHICLE TRAILER CARGO CARRYING CAPACITY” in block letters.

(b) The Vehicle Identification Number (VIN).

(c) The statement “THE WEIGHT OF CARGO SHOULD NEVER EXCEED: XXX kg or XXX lbs” in block letters with appropriate values included.

(d) The statement “CAUTION: A full load of water equals XXX kg or XXX lbs of cargo @ 1 kg/L (8.3 lb/gal)” with appropriate values included.

S9.3.6 For RVs, the vehicle capacity weight values and the seating capacity values (motor homes only) on the placard required by §4.3 or §4.3.5 must agree with the load carrying capacity weight values and the safety belt equipped seating capacity (motor homes only) on the RV load carrying capacity labels (Figures 3 and 4).

S9.3.7 The permanent motor home supplemental label must contain the following information in accordance with Figure 5:

(a) The statement “CAUTION: A full load of water equals XXX kg or XXX lbs of cargo @ 1 kg/L (8.3 lb/gal) and the tongue weight of a towed trailer counts as cargo” with appropriate values included.

S9.3.8 The permanent RV trailer supplemental label must contain the following information in accordance with Figure 6:

(a) The statement “CAUTION: A full load of water equals XXX kg or XXX lbs of cargo @ 1 kg/L (8.3 lb/gal)” with appropriate values included.

S10. Weight added to vehicles between final vehicle certification and first retail sale of the vehicle.

S10.1 If weight exceeding the lesser of 1.5 percent of GVWR or 45.4 kg (100 pounds) is added to a vehicle between final vehicle certification and first retail sale of the vehicle, the vehicle capacity weight values on the placard required by §4.3 or §4.3.5 and the load carrying capacity weight values on the RV load carrying capacity labels (Figures 3 and 4) required by §9.3 must be corrected using one or a combination of the following methods:

(a) Permanently affix load carrying capacity modification labels (Figure 7), which display the amount the load carrying capacity is reduced to the nearest kilogram with conversion to the nearest pound, within 25 millimeters of the original, permanent RV load carrying capacity label (Figure 3 or 4) and the original placard (Figure 1). The load carrying capacity modification labels must be legible, visible, permanent, moisture resistant, presented in the English language, have a minimum print size of 2.4 millimeters (3/32 inches) high and be printed in black print on a yellow background, or

(b) If the manufacturer selects §9.3.3(b), apply a temporary version of the load carrying capacity modification label (Figure 7) within 25 millimeters of the original, temporary RV load
carrying capacity label (Figure 3 or 4) on the interior of the forward-most exterior passenger door on the right side of the vehicle, in addition to applying a permanent version of the same label within 25 mm of the placard required by S4.3 or S4.3.5. Both temporary and permanent versions of the load carrying capacity modification label (Figure 7) may be printed without values and values may be legibly applied to the label with a black, fine point, indelible marker. The label must contain the statements “CAUTION—LOAD CARRYING CAPACITY REDUCED” in block letters and “Modifications to this vehicle have reduced the original load carrying capacity by XXX kg or XXX lbs” in accordance with Figure 7. If two load carrying capacity modification labels are required (one permanent and one temporary), the weight values on each must agree, or

(c) Modify the original, permanent RV load carrying capacity labels (Figures 3 and 4) and the placard (Figure 1) with correct vehicle capacity weight values. If the manufacturer selects S9.3.3(b), the temporary RV load carrying capacity labels (Figures 3 and 4) must also be replaced with the same labels containing correct vehicle capacity weight values.

§571.110

(c) Modify the original, permanent RV load carrying capacity labels (Figures 3 and 4) and the placard (Figure 1) with correct vehicle capacity weight values. Modification of labels requires a machine printed overlay with printed corrected values or blanks for corrected values that may be entered with a black, fine-point, indelible marker. Crossing out old values and entering corrected values on the original label is not permissible, or

(d) Replace the original, permanent RV load carrying capacity labels (Figures 3 and 4) and the placard (Figure 1) with the same labels/placard containing correct vehicle capacity weight values. If the manufacturer selects S9.3.3(b), the temporary RV load carrying capacity labels (Figures 3 and 4) must also be replaced with the same labels containing correct vehicle capacity weight values.

S10.2 Corrected load carrying capacity weight values or the weight amount the load carrying capacity is reduced, must reflect the total weight added between final vehicle certification and first retail sale and must be accurate within one percent of the actual added weight. No action is required if the weight of the vehicle is reduced between final vehicle certification and first retail sale.

§ 571.111 Standard No. 111; Rearview mirrors.

S1. Scope. This standard specifies requirements for the performance and location of rearview mirrors.

S2. Purpose. The purpose of this standard is to reduce the number of deaths and injuries that occur when the driver of a motor vehicle does not have a clear and reasonably unobstructed view to the rear.

S3. Application. This standard applies to passenger cars, multipurpose passenger vehicles, trucks, buses, schoolbuses and motorcycles.

S4. Definitions.

Convex mirror means a mirror having a curved reflective surface whose shape is the same as that of the exterior surface of a section of a sphere.

Effective mirror surface means the portions of a mirror that reflect images, excluding the mirror rim or mounting brackets.

Unit magnification mirror means a plane or flat mirror with a reflective surface through which the angular height and width of the image of an object is equal to the angular height and width of the object when viewed directly at the same distance except for flaws that do not exceed normal manufacturing tolerances. For the purposes of this regulation a prismatic day-night adjustment rearview mirror one of whose positions provides unit magnification is considered a unit magnification mirror.

S5. Requirements for passenger cars.

S5.1 Inside rearview mirror. Each passenger car shall have an inside rearview mirror of unit magnification.

S5.1.1 Field of view. Except as provided in S5.3, the mirror shall provide a field of view with an included horizontal angle measured from the projected eye point of at least 20 degrees, and a sufficient vertical angle to provide a view of a level road surface extending to the horizon beginning at a point not greater than 61 m to the rear of the vehicle when the vehicle is occupied by the driver and four passengers or the designated occupant capacity, if less, based on an average occupant weight of 68 kg. The line of sight may be partially obscured by seated occupants or by head restraints. The location of the driver’s eye reference points shall be those established in Motor Vehicle Safety Standard No. 104 (§ 571.104) or a nominal location appropriate for any 95th percentile male driver.

S5.2 Outside rearview mirror—driver’s side.

S5.2.1 Field of view. Each passenger car shall have an outside mirror of unit magnification. The mirror shall provide the driver a view of a level road surface extending to the horizon from a line, perpendicular to a longitudinal plane tangent to the driver’s side of the vehicle at the widest point, extending 2.4 m out from the tangent plane 10.7 m behind the driver’s eyes, with the seat in the rearmost position. The line of sight may be partially obscured by rear body or fender contours. The location of the driver’s eye reference points shall be those established in Motor Vehicle Safety Standard No. 104 (§ 571.104) or a nominal location appropriate for any 95th percentile male driver.

S5.2.2 Mounting. The mirror mounting shall provide a stable support for the mirror, and shall provide for mirror adjustment by tilting in both the horizontal and vertical directions. If the mirror is in the head impact area, the mounting shall deflect, collapse or break away without leaving sharp edges when the reflective surface of the mirror is subjected to a force of 400 N in any forward direction that is not more than 45° from the forward longitudinal direction.

S5.3 Outside rearview mirror passenger’s side. Each passenger car whose inside rearview mirror does not meet the field of view requirements of S5.1.1 shall have an outside mirror of unit magnification.
S5.1 Each multipurpose passenger vehicle and truck with a GVWR of more than 4,536 kg and less than 11,340 kg and each bus, other than a school bus, with a GVWR of more than 4,536 kg shall have outside mirrors of unit magnification, each with not less than 323 cm² of reflective surface, installed with stable supports on both sides of the vehicle. The mirrors shall be located so as to provide the driver a view to the rear along both sides of the vehicle and shall be adjustable both in the horizontal and vertical directions to view the rearward scene.

S8. Requirements for multipurpose passenger vehicles and trucks with a GVWR of 11,340 kg or more.

S8.1 Each multipurpose passenger vehicle and truck with a GVWR of 11,340 kg or more shall have outside mirrors of unit magnification, each with not less than 323 cm² of reflective surface, installed with stable supports on both sides of the vehicle. The mirrors shall be located so as to provide the driver a view to the rear along both sides of the vehicle and shall be adjustable both in the horizontal and vertical directions to view the rearward scene.

S9. Requirements for School Buses. When a school bus is tested in accordance with the procedures of S13, it shall meet the requirements of S9.1 through S9.4.

S9.1 Outside Rearview Mirrors. Each school bus shall have two outside rearview mirror systems: System A and System B.

S9.2. System A shall be located with stable supports so that the portion of the system on the bus’s left side, and the portion on its right side, each:

(a) Includes at least one mirror of unit magnification with not less than 323 cm² of reflective surface; and

(b) Includes one or more mirrors which together provide, at the driver’s eye location, a view of:

(1) For the mirror system on the right side of the bus, the entire top surface of cylinder N in Figure 2, and that area of the ground which extends rearward from cylinder N to a point not less than 61 meters from the mirror surface.

(2) For the mirror system on the left side of the bus, the entire top surface of cylinder M in Figure 2, and that area

magnification or a convex mirror installed on the passenger’s side. The mirror mounting shall provide a stable support and be free of sharp points or edges that could contribute to pedestrian injury. The mirror need not be adjustable from the driver’s seat but shall be capable of adjustment by tilting in both horizontal and vertical directions.

S5.4 Convex mirror requirements. Each motor vehicle using a convex mirror to meet the requirements of S5.3 shall comply with the following requirements:

S5.4.1 When each convex mirror is tested in accordance with the procedures specified in S12. of this standard, none of the radii of curvature readings shall deviate from the average radius of curvature by more than plus or minus 12.5 percent.

S5.4.2 Each convex mirror shall have permanently and indelibly marked at the lower edge of the mirror’s reflective surface, in letters not less than 4.8 mm nor more than 6.4 mm high the words “Objects in Mirror Are Closer Than They Appear.”

S5.4.3 The average radius of curvature of each such mirror, as determined by using the procedure in S12., shall be not less than 889 mm and not more than 1,651 mm.

S6. Requirements for multipurpose passenger vehicles, trucks, and buses, other than school buses, with a GVWR of 4,536 kg or less.

S6.1 Each multipurpose passenger vehicle, truck and bus, other than a school bus, with a GVWR of 4,536 kg or less shall have either—

(a) Mirrors that conform to the requirements of S5.1; or

(b) Outside mirrors of unit magnification, each with not less than 126 cm² of reflective surface, installed with stable supports on both sides of the vehicle, located so as to provide the driver a view to the rear along both sides of the vehicle, and adjustable in both the horizontal and vertical directions to view the rearward scene.

S7. Requirements for multipurpose passenger vehicles and trucks with a GVWR of more than 4,536 kg and less than 11,340 kg and buses, other than school buses, with a GVWR of more than 4,536 kg.
Nat’l Highway Traffic Safety Admin., DOT § 571.111

of the ground which extends rearward from cylinder M to a point not less than 61 meters from the mirror surface.

S9.3(a) For each of the cylinders A through P whose entire top surface is not directly visible from the driver’s eye location, System B shall provide, at that location:

(1) A view of the entire top surface of that cylinder.

(2) A view of the ground that overlaps with the view of the ground provided by System A.

(b) Each mirror installed in compliance with S9.3(a) shall meet the following requirements:

(1) Each mirror shall have a projected area of at least 258 cm², as measured on a plane at a right angle to the mirror’s axis.

(2) Each mirror shall be located such that the distance from the center point of the eye location of a 25th percentile adult female seated in the driver’s seat to the center of the mirror shall be at least 95 cm.

(3) Each mirror shall have no discontinuities in the slope of the surface of the mirror.

(4) Each mirror shall be installed with a stable support.

(c) Each school bus which has a mirror installed in compliance with S9.3(a) that has an average radius of curvature of less than 889 mm, as determined under S12, shall have a label visible to the seated driver. The label shall be printed in a type face and color that are clear and conspicuous. The label shall state the following:

“USE CROSS VIEW MIRRORS TO VIEW PEDESTRIANS WHILE BUS IS STOPPED. DO NOT USE THESE MIRRORS TO VIEW TRAFFIC WHILE BUS IS MOVING. IMAGES IN SUCH MIRRORS DO NOT ACCURATELY SHOW ANOTHER VEHICLE’S LOCATION.”

S9.4(a) Each image required by S9.3(a)(1) to be visible at the driver’s eye location shall be separated from the edge of the effective mirror surface of the mirror providing that image by a distance of not less than 3 minutes of arc.

(b) The image required by S9.3(a)(1) of cylinder P shall meet the following requirements:

(1) The angular size of the shortest dimension of that cylinder’s image shall be not less than 3 minutes of arc; and

(2) The angular size of the longest dimension of that cylinder’s image shall be not less than 9 minutes of arc.

S10. Requirements for motorcycles.

S10.1 Each motorcycle shall have either a mirror of unit magnification with not less than 8065 mm² of reflective surface, or a convex mirror with not less than 6450 mm² of reflective surface and an average radius of curvature not less than 508 mm and not greater than 1324 mm, installed with a stable support, and mounted so that the horizontal center of the reflective surface is at least 279 mm outward of the longitudinal centerline of the motorcycle. The mirror shall be adjustable by tilting in both the horizontal and vertical directions.

S11. Mirror Construction. The average reflectance of any mirror required by this standard shall be determined in accordance with SAE Recommended Practice J964, OCT84. All single reflectance mirrors shall have an average reflectance of at least 35 percent. If a mirror is capable of multiple reflectance levels, the minimum reflectance level in the day mode shall be at least 35 percent and the minimum reflectance level in the night mode shall be at least 4 percent. A multiple reflectance mirror shall either be equipped with a means for the driver to adjust the mirror to a reflectance level of at least 35 percent in the event of electrical failure, or achieve such reflectance level automatically in the event of electrical failure.

S12. Determination of radius of curvature.

S12.1 To determine the average radius of curvature of a convex mirror, use a 3-point linear spherometer, which meets the requirements of S12.2, at the 10 test positions shown in Figure 1 and record the readings for each position.

S12.2 The 3-point linear spherometer has two outer fixed legs 38 mm apart and one inner movable leg at the midpoint. The spherometer has a dial indicator with a scale that can be read accurately to .0025 mm, with the zero reading being a flat surface.

S12.3 The 10 test positions on the image display consist of two positions at right angles to each other at each of
§ 571.111

five locations as shown in Figure 1. The locations are at the center of the mirror, at the left and right ends of a horizontal line that bisects the mirror and at the top and bottom ends of a vertical line that bisects the mirror. None of the readings are within a 6.4 mm border on the edge of the image display.

S12.4 At each position, the spherometer is held perpendicular to the convex mirror-surface and a record is made of the reading on the dial indicator to the nearest .0025 mm.

S12.5 Convert the dial reading data for each of the 10 test positions to radius of curvature calculations using Table 1. Consider the change as linear for dial readings that fall between two numbers in Table I.

S12.6 Calculate the average radius of curvature by adding all 10 radius of curvature calculations and dividing by ten.

S12.7 Determine the numerical difference between the average radius of curvature and each of the 10 individual radius of curvature calculations determined in S12.5.

S12.8 Calculate the greatest percentage deviation by dividing the greatest numerical difference determined in S12.7 by the average radius of curvature and multiply by 100.

S13. School bus mirror test procedures. The requirements of S9.1 through S9.4 shall be met when the vehicle is tested in accordance with the following conditions.

S13.1. The cylinders shall be a color which provides a high contrast with the surface on which the bus is parked.

S13.2. The cylinders are 0.3048 m high and 0.3048 m in diameter, except for cylinder P which is 0.9144 m high and 0.3048 m in diameter.

S13.3. Place cylinders at locations as specified in S13.3(a) through S13.3(g) and illustrated in Figure 2. Measure the distances shown in Figure 2 from a cylinder to another object from the center of the cylinder as viewed from above.

(a) Place cylinders G, H, and I so that they are tangent to a transverse vertical plane tangent to the forward-most surface of the bus's front bumper. Place cylinders D, E, F so that their centers are located in a transverse vertical plane that is 1.8288 meters (6 feet) forward of a transverse vertical plane passing through the centers of cylinders G, H, and I. Place cylinders A, B, and C so that their centers are located in a transverse vertical plane that is 3.6576 meters (12 feet) forward of the transverse vertical plane passing through the centers of cylinders G, H, and I.

(b) Place cylinders B, E, and H so that their centers are in a longitudinal vertical plane that passes through the bus's longitudinal centerline.

(c) Place cylinders A, D, and G so that their centers are in a longitudinal vertical plane that is tangent to the most outboard edge of the left side of the bus's front bumper.

(d) Place cylinders C, F, and I so that their centers are in a longitudinal vertical plane that is tangent to the most outboard edge of the right side of the bus's front bumper.

(e) Place cylinder J so that its center is in a longitudinal vertical plane 0.3048 meters (1 foot) to the left of the longitudinal vertical plane passing through the centers of cylinders A, D, and G, and is in the transverse vertical plane that passes through the centerline of the bus's front axle.

(f) Place cylinder K so that its center is in a longitudinal vertical plane 0.3048 meters (1 foot) to the right of the longitudinal vertical plane passing through the centers of cylinders C, F, and I, and is in the transverse vertical plane 0.3048 meters (1 foot) to the right of the longitudinal vertical plane passing through the centers of cylinders C, F, and I.
plane that passes through the centerline of the bus’s front axle.

(g) Place cylinders L, M, N, O, and P so that their centers are in the transverse vertical plane that passes through the centerline of the bus’s rear axle. Place cylinder L so that its center is in a longitudinal vertical plane that is 1.8288 meters (6 feet) to the left of the longitudinal vertical plane tangent to the bus’s most outboard left surface (excluding the mirror system). Place cylinder M so that its center is in a longitudinal vertical plane that is 0.3048 meters (1 foot) to the left of the longitudinal vertical plane tangent to the bus’s left side. Place cylinder N so that its center is in a longitudinal vertical plane that is 0.3048 meters (1 foot) to the right of the longitudinal vertical plane tangent to the right side of the bus. Place cylinder O so that its center is in a longitudinal vertical plane that is 1.8288 meters (6 feet) to the right of the longitudinal vertical plane tangent to the right side of the bus. Place cylinder P so that its center is in a longitudinal vertical plane that is 3.6576 meters (12 feet) to the right of the longitudinal vertical plane tangent to the right side of the bus.
Figure 2.—Location of Test Cylinders for School Bus Field-of-View Test
All Dimensions in Meters (m)
S13.4 The driver's eye location is the eye location of a 25th percentile adult female, when seated in the driver's seat as follows:
(a) The center point of the driver's eye location is the point located 68.58 centimeters (27 inches) vertically above the intersection of the seat cushion and the seat back at the longitudinal centerline of the seat.
(b) Adjust the driver's seat to the midway point between the forward-most and rear-most positions, and if separately adjustable in the vertical direction, adjust to the lowest position. If an adjustment position does not
exist at the midway point, use the closest adjustment position to the rear of the midpoint. If a seat back is adjustable, adjust the seat back angle to the manufacturer's nominal design riding position in accordance with the manufacturer's recommendations.

S13.5 Adjustable mirrors are adjusted before the test in accordance with the manufacturer's recommendations. Such mirrors are not moved or readjusted at any time during the test.

13.6 Place a 35 mm or larger format camera, or video camera, so that its image plane is located at the center point of the driver's eye location or at any single point within a semicircular area established by a 15.24 centimeter (6 inch) radius parallel to and forward of the center point (see figure 3). With the camera at any single location or within that semicircle look through the camera and the windows of the bus and determine whether the entire top surface of each cylinder is directly visible.

S13.7 For each cylinder whose entire top surface is determined under paragraph 13.4 of this section not to be directly visible at the driver's eye location,

(a) Place a comparison chart (see figure 4) above the mirror that provides the fullest view of the cylinder in situations where a cylinder is partially visible through more than one mirror.

Figure 4.
Comparison Chart for Indirect Field-of-View Measurements

The width of the bars in Figure 4 indicating three minutes of arc and nine minutes of arc are derived from the following formula:

For 3 minutes of arc:
§ 571.112

X = \frac{D}{0.000873},

Where:
X = \text{the width of a line, in the unit of measurement} \ D, \ \text{representing} \ 3 \ \text{minutes of arc};
D = \text{distance from center point of driver's eye location to the center of the mirror's surface}; \ \text{and}
0.000873 = \text{tangent of} \ 3\ \text{minutes of arc}.

For 9 minutes of arc:

X = \frac{D}{0.002618},

Where:
X = \text{the width of a line, in the unit of measurement} \ D, \ \text{representing} \ 9 \ \text{minutes of arc};
D = \text{distance from center point of driver's eye location to the center of the mirror's surface}; \ \text{and}
0.002618 = \text{tangent of} \ 9\ \text{minutes of arc}.

(b) Photograph each cylinder through the mirror(s) that provides a view of the cylinder. Photograph each cylinder with the camera located so that the view through its film or image plane is located at any single location within the semicircle established under 13.4, [POINT A, B, C, OR D] ensuring that the image of the mirror and comparison chart fill the camera’s view finder to the extent possible.

13.8 Make all observations and take all photographs with the service/entry door in the closed position and the stop signal arm(s) in the fully retracted position.

§ 571.113 Standard No. 113; Hood latch system.

S1. Purpose and scope. This standard establishes the requirement for providing a hood latch system or hood latch systems.

S2. Application. This standard applies to passenger cars, multipurpose passenger vehicles, trucks, and buses.

S3. Definitions. Hood means any exterior movable body panel forward of the windshield that is used to cover an engine, luggage, storage, or battery compartment.

S4. Requirements.
(a) The normal activation of the vehicle’s engine or motor; and
(b) Either steering, or forward self-mobility, of the vehicle, or both.

§571.114 For each vehicle type manufactured by a manufacturer, the manufacturer must provide at least 1,000 unique key combinations, or a number equal to the total number of the vehicles of that type manufactured by the manufacturer, whichever is less. The same combinations may be used for more than one vehicle type.

§5.1.2 For each vehicle type manufactured by a manufacturer, the manufacturer must provide at least 1,000 unique key combinations, or a number equal to the total number of the vehicles of that type manufactured by the manufacturer, whichever is less. The same combinations may be used for more than one vehicle type.

§5.1.2 For each vehicle type manufactured by a manufacturer, the manufacturer must provide at least 1,000 unique key combinations, or a number equal to the total number of the vehicles of that type manufactured by the manufacturer, whichever is less. The same combinations may be used for more than one vehicle type.

§5.1.3 Except as specified below, an audible warning to the vehicle operator must be activated whenever the key is in the starting system and the door located closest to the driver’s designated seating position is opened. An audible warning to the vehicle operator need not activate:

(a) After the key has been inserted into the starting system, and before the driver takes further action; or
(b) If the key is in the starting system in a manner or position that allows the engine or motor to be started or to continue operating; or

(c) For mechanical keys and starting systems, after the key has been withdrawn to a position from which it may not be turned.

§5.1.4 If a vehicle is equipped with a transmission with a “park” position, the means for deactivating the vehicle’s engine or motor must not activate any device installed pursuant to §5.1.1(b), unless the transmission is locked in the “park” position.

§5.2 Rollaway prevention in vehicles equipped with transmissions with a “park” position.

§5.2.1 Except as specified in §5.2.3, the starting system required by §5.1 must prevent key removal when tested according to the procedures in §6, unless the transmission or gear selection control is locked in “park” or becomes locked in “park” as a direct result of key removal.

§5.2.2 Except as specified in §5.2.4, the vehicle must be designed such that the transmission or gear selection control cannot move from the “park” position, unless the key is in the starting system.

§5.2.3 Key removal override option. At the option of the manufacturer, the key may be removed from the starting system without the transmission or gear selection control in the “park” position under one of the following conditions:

(a) In the event of electrical failure, including battery discharge, the vehicle may permit key removal from the starting system without the transmission or gear selection control locked in the “park” position; or

(b) Provided that steering or self-mobility is prevented, the vehicle may have a device by which the user can remove the key from the starting system without the transmission or gear selection control locked in “park.” This device must require:

(i) The use of a tool, and

(ii) Simultaneous activation of the device and removal of the key; or

(c) Provided that steering or self-mobility is prevented, the vehicle may have a device by which the user can remove the key from the starting system without the transmission or gear selection control locked in “park.” This device must be covered by an opaque surface which, when installed:

(i) Prevents sight of and use of the device, and

(ii) Can be removed only by using a screwdriver or other tool.

§5.2.4 Gear selection control override option. The vehicle may have a device by which the user can move the gear selection control from “park” after the key has been removed from the starting system. This device must be operable by one of the three options below:

(a) By use of the key; or

(b) By a means other than the key, provided steering or forward self-mobility is prevented when the key is removed from the starting system. Such a means must require:

(i) The use of a tool, and

(ii) Simultaneous activation of this means and movement of the gear selection control from “park;” or

(c) By a means other than the key, provided steering or forward self-mobility is prevented when the key is removed from the starting system. This device must be covered by an opaque surface which, when installed:

(i) Prevents sight of and use of the device, and

(ii) Can be removed only by using a screwdriver or other tool.
§571.115

S5.2.5 When tested in accordance with S6.2.2, each vehicle must not move more than 150 mm on a 10 percent grade when the gear selection control is locked in “park.”

S6. Compliance test procedure for vehicles with transmissions with a “park” position.
S6.1 Test conditions.
S6.1.1 The vehicle shall be tested at curb weight plus 91 kg (including the driver).
S6.1.2 Except where specified otherwise, the test surface shall be level.
S6.2 Test procedure.
S6.2.1 (a) Activate the starting system using the key.
   (b) Move the gear selection control to any gear selection position or any other position where it will remain without assistance, including a position between any detent positions, except for the “park” position.
   (c) Attempt to remove the key in each gear selection position.
S6.2.2 (a) Drive the vehicle forward up a 10 percent grade and stop it with the service brakes.
   (b) Apply the parking brake (if present).
   (c) Move the gear selection control to “park.”
   (d) Note the vehicle position.
   (e) Release the parking brake. Release the service brakes.
   (f) Remove the key.
   (g) Verify that the gear selection control or transmission is locked in “park.”
   (h) Verify that the vehicle, at rest, has moved no more than 150 mm from the position noted prior to release of the brakes.

[71 FR 17755, Apr. 7, 2006]

§571.115 [Reserved]

§571.116 Standard No. 116; Motor vehicle brake fluids.

S1. Scope. This standard specifies requirements for fluids for use in hydraulic brake systems of motor vehicles, containers for these fluids, and labeling of the containers.
S2. Purpose. The purpose of this standard is to reduce failures in the hydraulic braking systems of motor vehicles which may occur because of the manufacture or use of improper or contaminated fluid.
S3. Application. This standard applies to all fluid for use in hydraulic brake systems of motor vehicles. In addition, S5.3 applies to passenger cars, multipurpose passenger vehicles, trucks, buses, trailers, and motorcycles.
S4. Definitions.

Blister means a cavity or sac on the surface of a brake cup.
Brake fluid means a liquid designed for use in a motor vehicle hydraulic brake system in which it will contact elastomeric components made of styrene and butadiene rubber (SBR), ethylene and propylene rubber (EPR), polychloroprene (CR) brake hose inner tube stock or natural rubber (NR).
Chipping means a condition in which small pieces are missing from the outer surface of a brake cup.
Duplicate samples means two samples of brake fluid taken from a single packaged lot and tested simultaneously.
Hydraulic system mineral oil means a mineral-oil-based fluid designed for use in a motor vehicle hydraulic brake system in which the fluid is not in contact with components made of SBR, EPR or NR.
Packager means any person who fills containers with brake fluid that are subsequently distributed for retail sale.
Packed lot is that quantity of brake fluid shipped by the manufacturer to
§ 571.116

The National Highway Traffic Safety Administration, DOT

the packager in a single container, or that quantity of brake fluid manufactured by a single plant run of 24 hours or less, through the same processing equipment and with no change in ingredients.

Scuffing means a visible erosion of a portion of the outer surface of a brake cup.

A silicone base brake fluid (SBBF) is a brake fluid which consists of not less than 70 percent by weight of a diorganosiloxane.

Sloughing means degradation of a brake cup as evidenced by the presence of carbon black loosely held on the brake cup surface, such that a visible black streak is produced when the cup, with a 500 ±10 gram deadweight on it, is drawn base down over a sheet of white bond paper placed on a firm flat surface.

Stickiness means a condition on the surface of a brake cup such that fibers will be pulled from a wad of U.S.P. absorbent cotton when it is drawn across the surface.

S5. Requirements. This section specifies performance requirements for DOT 3, DOT 4 and DOT 5 brake fluids; requirements for brake fluid certification; and requirements for container sealing, labeling and color coding for brake fluids and hydraulic system mineral oils. Where a range of tolerances is specified, the brake fluid shall meet the requirements at all points within the range.

S5.1 Brake fluid. When tested in accordance with S6, brake fluids shall meet the following requirements:

S5.1.1 Equilibrium reflux boiling point (ERBP). When brake fluid is tested according to S6.1, the ERBP shall not be less than the following value for the grade indicated:

(a) DOT 3: 205 °C (401 °F).
(b) DOT 4: 230 °C (446 °F).
(c) DOT 5: 260 °C (500 °F).

S5.1.2 Wet ERBP. When brake fluid is tested according to S6.2, the wet ERBP shall not be less than the following value for the grade indicated:

(a) DOT 3: 140 °C (284 °F).
(b) DOT 4: 155 °C (311 °F).
(c) DOT 5: 180 °C (356 °F).

S5.1.3 Kinematic viscosities. When brake fluid is tested according to S6.3, the kinematic viscosities in square millimeters per second at stated temperatures shall be neither less than 1.5 mm²/s at 100 °C (212 °F.) nor more than the following maximum value for the grade indicated:

(a) DOT 3: 1,500 mm²/s at minus 40 °C. (minus 40 °F.).
(b) DOT 4: 1,800 mm²/s at minus 40 °C. (minus 40 °F.).
(c) DOT 5: 900 mm²/s at minus 40 °C. (minus 40 °F.).

S5.1.4 pH value. When brake fluid, except DOT 5 SBBF, is tested according to S6.4, the pH value shall not be less than 7.0 nor more than 11.5.

S5.1.5 Brake fluid stability.

S5.1.5.1 High-temperature stability. When brake fluid is tested according to S6.5.2 the ERBP shall not change by more than 3 °C (5.4 °F.) plus 0.05° for each degree that the ERBP of the fluid exceeds 225 °C (437 °F.).

S5.1.5.2 Chemical stability. When brake fluid, except DOT 5 SBBF, is tested according to S6.5.4, the change in temperature of the refluxing fluid mixture shall not exceed 3.0 °C (5.4 °F.) plus 0.05° for each degree that the ERBP of the fluid exceeds 225 °C (437 °F.).

S5.1.6 Corrosion. When brake fluid is tested according to S6.6—

(a) The metal test strips shall not show weight changes exceeding the limits stated in Table I.

Table I

<table>

(b) Excluding the area of contact (13 ±1 mm. (1⁄2 ±1⁄32 inch) measured from the bolt hole end of the test strip), the metal test strips shall not show pitting or etching to an extent discernible without magnification;

(c) The water-wet brake fluid at the end of the test shall show no jelling at 23 ±5 °C (73.4 ±9 °F.);

(d) No crystalline deposit shall form and adhere to either the glass jar walls or the surface of the metal strips;
§571.116  49 CFR Ch. V (10–1–08 Edition)

(e) At the end of the test, sedimentation of the water-wet brake fluid shall not exceed 0.10 percent by volume;

(f) The pH value of water-wet brake fluid, except DOT 5 SBBF, at the end of the test shall not be less than 7.0 nor more than 11.5;

(g) The cups at the end of the test shall show no disintegration, as evidenced by blisters or sloughing;

(h) The hardness of the cup shall not decrease by more than 15 International Rubber Hardness Degrees (IRHD); and

(i) The base diameter of the cups shall not increase by more than 1.4 mm. (0.055 inch).

S5.1.7 Fluidity and appearance at low temperature. When brake fluid is tested according to S6.7, at the storage temperature and for the storage times given in Table II—

(a) The fluid shall show no sludging, sedimentation, crystallization, or stratification;

(b) Upon inversion of the sample bottle, the time required for the air bubble to travel to the top of the fluid shall not exceed the bubble flow times shown in Table II; and

(c) On warming to room temperature, the fluid shall resume the appearance and fluidity that it had before chilling.

S5.1.8 [Reserved]

S5.1.9 Water tolerance. (a) At low temperature. When brake fluid is tested according to S6.9.3(a)—

(1) The fluid shall show no sludging, sedimentation, crystallization, or stratification;

(2) Upon inversion of the centrifuge tube, the air bubble shall travel to the top of the fluid in not more than 10 seconds;

(3) If cloudiness has developed, the wet fluid shall regain its original clarity and fluidity when warmed to room temperature; and

(b) At 60 °C. (140 °F.). When brake fluid is tested according to S6.9.3(b)—

(1) The fluid shall show no stratification; and

(2) Sedimentation shall not exceed 0.15 percent by volume after centrifuging.

S5.1.10 Compatibility. (a) At low temperature. When brake fluid is tested according to S6.10.3(a), the test specimen shall show no sludging, sedimentation, or crystallization. In addition, fluids, except DOT 5 SBBF, shall show no stratification.

(b) At 60 °C. (140 °F.). When brake fluid is tested according to S6.10.3(b)—

(1) Sedimentation shall not exceed 0.05 percent by volume after centrifuging; and

(2) Fluids, except DOT 5 SBBF, shall show no stratification.

S5.1.11 Resistance to oxidation. When brake fluid is tested according to S6.11—

(a) The metal test strips outside the areas in contact with the tinfoil shall not show pitting or etching to an extent discernible without magnification;

(b) No more than a trace of gum shall be deposited on the test strips outside the areas in contact with the tinfoil;

(c) The aluminum strips shall not change in weight by more than 0.05 mg./sq. cm.; and

(d) The cast iron strips shall not change in weight by more than 0.3 mg./sq. cm.

S5.1.12 Effects on cups. When brake cups are subjected to brake fluid in accordance with S6.12—

(a) The increase in the diameter of the base of the cups shall be not less than 0.15 mm. (0.006 inch) or more than 1.40 mm. (0.055 inch);

(b) The decrease in hardness of the cups shall be not more than 10 IRHD at 70 °C. (158 °F.) or more than 15 IRHD at 120 °C. (248 °F.), and there shall be no increase in hardness of the cups; and

(c) The cups shall show no disintegration as evidenced by stickiness, blisters, or sloughing.

S5.1.13 Stroking properties. When brake fluid is tested according to S6.13—

(a) Metal parts of the test system shall show no pitting or etching to an extent discernible without magnification;
(b) The change in diameter of any cylinder or piston shall not exceed 0.13 mm. (0.005 inch);

(c) The average decrease in hardness of seven of the eight cups tested (six wheel cylinder and one master cylinder primary) shall not exceed 17 IRHD. Not more than one of the seven cups shall have a decrease in hardness greater than 17 IRHD;

(d) None of the eight cups shall be in an unsatisfactory operating condition as evidenced by stickiness, scuffing, blisters, cracking, chipping, or other change in shape from its original appearance;

(e) None of the eight cups shall show an increase in base diameter greater than 0.90 mm (0.035 inch);

(f) The average lip diameter set of the eight cups shall not be greater than 65 percent.

(g) During any period of 24,000 strokes, the volume loss of fluid shall not exceed 36 milliliters;

(h) The cylinder pistons shall not freeze or function improperly throughout the test;

(i) The total loss of fluid during the 100 strokes at the end of the test shall not exceed 36 milliliters;

(j) The fluid at the end of the test shall show no formation of gels;

(k) At the end of the test the amount of sediment shall not exceed 1.5 percent by volume; and

(l) Brake cylinders shall be free of deposits that are abrasive or that cannot be removed when rubbed moderately with a nonabrasive cloth wetted with ethanol.

§5.1.14 Fluid color. Brake fluid and hydraulic system mineral oil shall be of the color indicated:

DOT 3, DOT 4, and DOT 5.1 non-SBBF—colorless to amber.

DOT 5 SBBF—purple.

Hydraulic system mineral oil—green.

§5.2 Packaging and labeling requirements for motor vehicle brake fluids.

§5.2.1 Container sealing. Each brake fluid or hydraulic system mineral oil container with a capacity of 177 mL or more shall be provided with a resealable closure that has an inner seal impervious to the packaged brake fluid. The container closure shall include a tamper-proof feature that will either be destroyed or substantially altered when the container closure is initially opened.

§5.2.2 Certification, marking, and labeling.

§5.2.2.1 Each manufacturer of a DOT grade brake fluid shall furnish to each packager, distributor, or dealer to whom he delivers brake fluid, the following information:

(a) A serial number identifying the production lot and the date of manufacture of the brake fluid.

(b) The grade (DOT 3, DOT 4, DOT 5) of the brake fluid. If DOT 5 grade brake fluid , it shall be further distinguished as ''DOT 5 SILICONE BASE'' or ''DOT 5.1 NON-SILICONE BASE.''

(c) The minimum wet boiling point in Fahrenheit of the brake fluid.

(d) Certification that the brake fluid conforms to §571.116.

§5.2.2.2 Each packager of brake fluid shall furnish the information specified in paragraphs (a) through (g) of this §5.2.2.2 by clearly marking it on each brake fluid container or on a label (labels) permanently affixed to the container, in any location except a removable part such as a lid. After being subjected to the operations and conditions specified in §6.14, the information required by this section shall be legible to an observer having corrected visual acuity of 20/40 (Snellen ratio) at a distance of 305 mm, and any label affixed to the container in compliance with this section shall not be removable without its being destroyed or defaced.

(a) Certification that the brake fluid conforms to §571.116.

(b) The name of the packager of the brake fluid, which may be in code form.

(c) The name and complete mailing address of the distributor.

(d) A serial number identifying the packaged lot and date of packaging.

(e) Designation of the contents as ''DOT—MOTOR VEHICLE BRAKE FLUID'' (Fill in DOT 3, DOT 4, DOT 5 SILICONE BASE, or DOT 5.1 NON-SILICONE BASE as applicable).

(f) The minimum wet boiling point in Fahrenheit of the DOT brake fluid in the container.

(g) The following safety warnings in capital and lower case letters as indicated:
(1) FOLLOW VEHICLE MANUFACTURER’S RECOMMENDATIONS WHEN ADDING BRAKE FLUID.

(2) KEEP BRAKE FLUID CLEAN AND DRY. Contamination with dirt, water, petroleum products or other materials may result in brake failure or costly repairs.

(3) STORE BRAKE FLUID ONLY IN ITS ORIGINAL CONTAINER. KEEP CONTAINER CLEAN AND TIGHTLY CLOSED TO PREVENT ABSORPTION OF MOISTURE.

(4) CAUTION: DO NOT REFILL CONTAINER, AND DO NOT USE FOR OTHER LIQUIDS. (Not required for containers with a capacity in excess of 19 L.)

S5.2.2.3 Each packager of hydraulic system mineral oil shall furnish the information specified in paragraphs (a) through (e) of this S5.2.2.3 by clearly marking it on each brake fluid container or on a label (labels) permanently affixed to the container, in any location except a removable part such as a lid. After being subjected to the operations and conditions specified in S6.14, the information required by this section shall be legible to an observer having corrected visual acuity of 20/40 (Snellen ratio) at a distance of 305 mm and any label affixed to the container in compliance with this section shall not be removable without its being destroyed or defaced.

(a) The name of the packager of the hydraulic system mineral oil, which may be in code form.

(b) The name and complete mailing address of the distributor.

(c) A serial number identifying the packaged lot and date of packaging.

(d) Designation of the contents as “HYDRAULIC SYSTEM MINERAL OIL” in capital letters at least 3 mm high.

(e) The following safety warnings in capital and lower case letters as indicated:

(1) FOLLOW VEHICLE MANUFACTURER’S RECOMMENDATIONS WHEN ADDING HYDRAULIC SYSTEM MINERAL OIL.

(2) Hydraulic System Mineral Oil is NOT COMPATIBLE with the rubber components of brake systems designed for use with DOT brake fluids.

(3) KEEP HYDRAULIC SYSTEM MINERAL OIL CLEAN. Contamination with dust or other materials may result in brake failure or costly repair.

(4) CAUTION: STORE HYDRAULIC SYSTEM MINERAL OIL ONLY IN ITS ORIGINAL CONTAINER. KEEP CONTAINER CLEAN AND TIGHTLY CLOSED. DO NOT REFILL CONTAINER OR USE OTHER LIQUIDS. (The last sentence is not required for containers with a capacity in excess of 19 L.)

S5.2.2.4 If a container for brake fluid or hydraulic system mineral oil is not normally visible but designed to be protected by an outer container or carton during use, the outer container or carton rather than the inner container shall meet the labeling requirements of S5.2.2.2 or S5.2.2.3, as appropriate.

S5.3 Motor vehicle requirement. Each passenger car, multipurpose passenger vehicle, truck, bus, trailer, and motorcycle that has a hydraulic brake system shall be equipped with fluid that has been manufactured and packaged in conformity with the requirements of this standard.

S6. Test procedures.

S6.1 Equilibrium reflux boiling point. Determine the ERBP of a brake fluid by running duplicate samples according to the following procedure and averaging the results.

S6.1.1 Summary of procedure. Sixty milliliters (ml.) of brake fluid are boiled under specified equilibrium conditions (reflux) at atmospheric pressure in a 100-ml. flask. The average temperature of the boiling fluid at the end of the reflux period, corrected for variations in barometric pressure if necessary, is the ERBP.

S6.1.2 Apparatus. (See Figure 1) The test apparatus shall consist of—

(a) Flask. (See Figure 2) A 100-ml. round-bottom, short-neck heat-resistant glass flask having a neck with a 19⁄38 standard taper, female ground-glass joint and a side-entering tube, with an outside diameter of 10 millimeters (mm.), which centers the thermometer bulb in the flask 6.5 mm. from the bottom;

(b) Condenser. A water-cooled, reflux, glass-tube type, condenser having a jacket 200 mm. in length, the bottom
end of which has a \( \frac{19}{38} \) standard-taper, drip-tip, male ground-glass joint;

(c) **Boiling stones.** Three clean, unused silicon carbide grains (approximately 2 mm. (0.08 inch) in diameter, grit No. 8);

(d) **Thermometer.** Standardized calibrated partial immersion (76 mm.), solid stem, thermometers conforming to the requirements for an ASTM 2C or 2F, and an ASTM 3C or 3F thermometer; and

(e) **Heat source.** Variable autotransformer-controlled heating mantle designed to fit the flask, or an electric heater with rheostat heat control.

---

**FIG. 1—BOILING POINT TEST APPARATUS**

**FIG. 2—DETAIL OF 100 ML SHORT-NECK FLASK**

**S6.1.3 Preparation of apparatus.**

(a) Thoroughly clean and dry all glassware.

(b) Insert thermometer through the side tube until the tip of the bulb is 6.5 mm. (1/4 inch) from the bottom center of the flask. Seal with a short piece of natural rubber, EPDM, SBR, or butyl tubing.

(c) Place 60 ±1 ml. of brake fluid and the silicon carbide grains into the flask.

(d) Attach the flask to the condenser. When using a heating mantle, place the mantle under the flask and support it with a ring-clamp and laboratory-type stand, holding the entire assembly in place by a clamp. When using a rheostat-controlled heater, center a standard porcelain or hard asbestos refractory, having a diameter opening 32 to 38 mm., over the heating element and mount the flask so that direct heat is applied only through the opening in the refractory. Place the assembly in an area free from drafts or other types of sudden temperature changes. Connect the cooling water inlet and outlet tubes to the condenser. Turn on the cooling water. The water supply temperature shall not exceed 28 °C. (82.4 °F.) and the temperature rise through the condenser shall not exceed 2 °C. (3.6 °F.).

**S6.1.4 Procedure.** Apply heat to the flask so that within 10 ±2 minutes the fluid is refluxing in excess of 1 drop per
§ 571.116 49 CFR Ch. V (10–1–08 Edition)

second. The reflux rate shall not exceed 5 drops per second at any time. Immediately adjust the heating rate to obtain an equilibrium reflux rate of 1 to 2 drops per second over the next 5 ± 2 minutes. Maintain this rate for an additional 2 minutes, taking four temperature readings at 30-second intervals. Record the average of these as the observed ERBP. If no reflux is evident when the fluid temperature reaches 260 °C (500 °F), discontinue heating and report ERBP as in excess of 260 °C (500 °F).

S6.1.5 Calculation. (a) Thermometer inaccuracy. Correct the observed ERBP by applying any correction factor obtained in standardizing the thermometer.

(b) Variation from standard barometric pressure. Apply the factor shown in Table III to calculate the barometric pressure correction to the ERBP.

(c) If the two corrected observed ERBP’s agree within 2 °C (4 °F) for brake fluids having an ERBP over 230 °C (446 °F) average the duplicate runs as the ERBP; otherwise, repeat the entire test, averaging the four corrected observed values to determine the original ERBP.

S6.2 Wet ERBP. Determine the wet ERBP of a brake fluid by running duplicate samples according to the following procedure.

S6.2.1 Summary of procedure. A 350 ml. sample of the brake fluid is humidified under controlled conditions; 350 ml. of SAE triethylene glycol monomethyl ether, brake fluid grade, referee material (TEGME) as described in appendix E of SAE Standard J1703 Nov. 83, “Motor Vehicle Brake Fluid,” November 1983, is used to establish the end point for humidification. After humidification, the water content and ERBP of the brake fluid are determined.

S6.2.2 Apparatus for humidification. (See Figure 3).

Test apparatus shall consist of—

(a) Glass jars. Four SAE RM–49 corrosion test jars or equivalent screwtop, straight-sided, round glass jars each having a capacity of about 475 ml. and approximate inner dimensions of 100 mm. in height by 75 mm. in diameter, with matching lids having new, clean inserts providing water-vapor-proof seals;

(b) Desiccator and cover. Two bowl-form glass desiccators, 250-mm. inside diameter, having matching tubulated covers fitted with No. 8 rubber stoppers; and

(c) Desiccator plate. Two 230-mm. diameter, perforated porcelain desiccator plates, without feet, glazed on one side.

S6.2.3 Reagents and materials. (a) Distilled water, see S7.1.

(b) SAE TEGME referee material.

S6.2.4 Preparation of apparatus. Lubricate the ground-glass joint of the desiccator. Pour 450 ± 10 ml. of distilled water into each desiccator and insert perforated porcelain desiccator plates. Place the desiccators in an oven with temperature controlled at 50 ± 1 °C (122 ± 1.8 °F) throughout the humidification procedure.

S6.2.5 Procedure. Pour 350 ± 5 ml. of brake fluid into an open corrosion test jar. Prepare in the same manner a duplicate test fluid sample and two duplicate specimens of the SAE TEGME referee material (350 ± 5 ml. of TEGME in each jar). The water content of the SAE TEGME fluid is adjusted to 0.50 ± 0.05 percent by weight at the start of the test in accordance with S7.2. Place one sample each of the test brake fluid and the prepared TEGME sample into the same desiccator. Repeat for the second sample of test brake fluid and TEGME in a second desiccator. Place the desiccators in the 50 °C (122 °F) controlled oven and replace desiccator covers. At intervals, during oven humidification, remove the rubber stoppers in the tops of desiccators. Using a long needed hypodermic syringe, take a sample of not more than 2 ml. from each TEGME sample and determine its water content. Remove no more than 10 ml. of fluid from each SAE TEGME.
sample during the humidification procedure. When the water content of the SAE fluid reaches 3.70 ± 0.05 percent by weight (average of the duplicates), remove the two test fluid specimens from their desiccators and promptly cap each jar tightly. Allow the sealed jars to cool for 60 to 90 minutes at 23° ± 5° C. (73.4° ± 9° F.). Measure the water contents of the test fluid specimens in accordance with S7.2 and determine their ERBP’s in accordance with S6.1. If the two ERBP’s agree within 4 °C. (8 °F.), average them to determine the wet ERBP; otherwise repeat and average the four individual ERBP’s as the wet ERBP of the brake fluid.

S6.3 Kinematic viscosities. Determine the kinematic viscosity of a brake fluid in mm²/s by the following procedure. Run duplicate samples at each of the specified temperatures, making two timed runs on each sample.

S6.3.1 Summary of the procedure. The time is measured for a fixed volume of
§ 571.116

49 CFR Ch. V (10–1–08 Edition)

the brake fluid to flow through a calibrated glass capillary viscometer under an accurately reproducible head and at a closely controlled temperature. The kinematic viscosity is then calculated from the measured flow time and the calibration constant of the viscometer.

S6.3.2 Apparatus.

(b) Viscometer holders and frames. Mount a viscometer in the constant-temperature bath so that the mounting tube is held within 1° of the vertical.

(c) Viscometer bath. A transparent liquid bath of sufficient depth such that at no time during the measurement will any portion of the sample in the viscometer be less than 2 cm. below the surface or less than 2 cm. above the bottom. The bath shall be cylindrical in shape, with turbulent agitation sufficient to meet the temperature control requirements. For measurements within 15° to 100° C. (60° to 212° F.) the temperature of the bath medium shall not vary by more than 0.01° C. (0.02° F.) over the length of the viscometers, or between the positions of the viscometers, or at the locations of the thermometers. Outside this range, the variation shall not exceed 0.03° C. (0.05° F.).

(d) Thermometers. Liquid-in-Glass Kinematic Viscosity Test Thermometers, covering the range of test temperatures indicated in Table IV and conforming to ASTM E1–68, ‘‘Specifications for ASTM Thermometers,’’ and in the IP requirements for IP Standard Thermometers. Standardize before use (see S6.3.3(b)). Use two standardized thermometers in the bath.

</table>

(e) Timing device. Stop watch or other timing device graduated in divisions representing not more than 0.2 second, with an accuracy of at least ±0.05 percent when tested over intervals of 15 minutes. Electrical timing devices may be used when the current frequency is controlled to an accuracy of 0.01 percent or better.

S6.3.3 Standardization.

(a) Viscometers. Use viscometers calibrated in accordance with appendix 1 of ASTM D445–65, ‘‘Viscosity of Transparent and Opaque Liquids (Kinematic and Dynamic Viscosities).’’ The calibration constant, C, is dependent upon the gravitational acceleration at the place of calibration. This must, therefore, be supplied by the standardization laboratory together with the instrument constant. Where the acceleration of gravity, g, in the two locations differs by more than 0.1 percent, correct the calibration constant as follows:

\[ C_2 = \left( \frac{g_2}{g_1} \right) \times C_1 \]

where the subscripts 1 and 2 indicate respectively the standardization laboratory and the testing laboratory.

(b) Thermometers. Check liquid-in-glass thermometers to the nearest 0.01° C. (0.02° F.) by direct comparison with a standardized thermometer. Kinematic Viscosity Test Thermometers shall be standardized at ‘‘total immersion.’’ The ice point of standardized thermometers shall be determined before use and the official corrections shall be adjusted to conform to the changes in ice points. (See ASTM E77–66, ‘‘Verification and Calibration of Liquid-in-Glass Thermometers.’’)

(c) Timers. Time signals are broadcast by the National Bureau of Standards,
Station WWV, Washington, DC at 2.5, 5, 10, 15, 20, 25, 30, and 35 Mc/sec (MHz). Time signals are also broadcast by Station CHU from Ottawa, Canada, at 3.330, 7.335, and 14.670 Mc/sec, and Station MSF at Rugby, United Kingdom, at 2.5, 5, and 10 Mc/sec.

§6.3.4 Procedure. (a) Set and maintain the bath at the appropriate test temperature (see §5.1.3) within the limits specified in §6.3.2(c). Apply the necessary corrections, if any, to all thermometer readings.

(b) Select a clean, dry, calibrated viscometer giving a flow time not less than its specified minimum, or 200 seconds, whichever is the greater.

(c) Charge the viscometer in the manner used when the instrument was calibrated. Do not filter or dry the brake fluid, but protect it from contamination by dirt and moisture during filling and measurements.

(1) Charge the suspended level viscometers by tilting about 30° from the vertical and pouring sufficient brake fluid through the fill tube into the lower reservoir so that when the viscometer is returned to vertical position the meniscus is between the fill marks. For measurements below 0 °C. (32 °F.), before placing the filled viscometer into the constant temperature bath, draw the sample into the working capillary and timing bulb and insert small rubber stoppers to suspend the fluid in this position, to prevent accumulation of water condensate on the walls of the critical portions of the viscometer. Alternatively, fit loosely packed drying tubes into the open ends of the viscometer to prevent water condensation, but do not restrict the flow of the sample under test by the pressures created in the instrument.

(2) If a Cannon-Fenske Routine viscometer is used, charge by inverting and immersing the smaller arm into the brake fluid and applying vacuum to the larger arm. Fill the tube to the upper timing mark, and return the viscometer to an upright position.

(d) Mount the viscometer in the bath in a true vertical position (see §6.3.2(b)).

(e) The viscometer shall remain in the bath until it reaches the test temperature.

(f) At temperatures below 0 °C. (32 ºF.) conduct an untimed preliminary run by allowing the brake fluid to drain through the capillary into the lower reservoir after the test temperature has been established.

(g) Adjust the head level of the brake fluid to a position in the capillary arm about 5 mm. above the first timing mark.

(h) With brake fluid flowing freely measure to within 0.2 second the time required for the meniscus to pass from the first timing mark to the second. If this flow time is less than the minimum specified for the viscometer, or 200 seconds, whichever is greater, repeat using a viscometer with a capillary of smaller diameter.

(i) Repeat §6.3.4 (g) and (h). If the two timed runs do not agree within 0.2 percent, reject and repeat using a fresh sample of brake fluid.

§6.3.5 Cleaning the viscometers. (a) Periodically clean the instrument with chromic acid to remove organic deposits. Rinse thoroughly with distilled water and acetone, and dry with clean dry air.

(b) Between successive samples rinse the viscometer with ethanol (isopropanol when testing DOT 5 fluids) followed by an acetone or ether rinse. Pass a slow stream of filtered dry air through the viscometer until the last trace of solvent is removed.

§6.3.6 Calculation. (a) The following viscometers have a fixed volume charged at ambient temperature, and as a consequence C varies with test temperature: Cannon-Fenske Routine, Pinkevitch, Cannon-Manning Semi-Micro, and Cannon Fenske Opaque. To calculate C at test temperatures other than the calibration temperature for these viscometers, see ASTM D2515–66, “Kinematic Glass Viscometers” or follow instructions given on the manufacturer’s certificate of calibration.

(b) Average the four timed runs on the duplicate samples to determine the kinematic viscosities.

§6.3.7 Precision (at 95 percent confidence level). (a) Repeatability. If results on duplicate samples by the same operator differ by more than 1 percent of their mean, repeat the tests.
§571.116

49 CFR Ch. V (10–1–08 Edition)

S6.4 pH value. Determine the pH value of a brake fluid by running one sample according to the following procedure.

S6.4.1 Summary of the procedure. Brake fluid is diluted with an equal volume of an ethanol-water solution. The pH of the resultant mixture is measured with a prescribed pH meter assembly at 23 °C. (73.4 °F.).

S6.4.2 Apparatus. The pH assembly consists of the pH meter, glass electrode, and calomel electrode, as specified in Appendices A1.1, A1.2, and A1.3 of ASTM D 1121–67, “Standard Method of Test for Reserve Alkalinity of Engine Antifreezes and Antirusts.” The glass electrode is a full range type (pH 0–14), with low sodium error.

S6.4.3 Reagents. Reagent grade chemicals conforming to the specifications of the Committee on Analytical Reagents of the American Chemical Society.

(a) Distilled water. Distilled water (S7.1) shall be boiled for about 15 minutes to remove carbon dioxide, and protected with a soda-lime tube or its equivalent while cooling and in storage. (Take precautions to prevent contamination by the materials used for protection against carbon dioxide.) The pH of the boiled distilled water shall be between 6.2 and 7.2 at 25 °C. (77 °F.).

(b) Standard buffer solutions. Prepare buffer solutions for calibrating the pH meter and electrode pair from salts sold specifically for use, either singly or in combination, as pH standards.

Dry salts for 1 hour at 110 °C (230 °F.) before use except for borax which shall be used as the decahydrate. Store solutions with pH less than 9.5 in bottles of chemically resistant glass or polyethylene. Store the alkaline phosphate solution in a glass bottle coated inside with paraffin. Do not use a standard with an age exceeding three months.

(1) Potassium hydrogen phthalate buffer solution (0.05 M, pH=4.01 at 25 °C. (77 °F.)). Dissolve 10.21 g. of potassium hydrogen phthalate (KHC\(_8\)H\(_4\)O\(_4\)) in distilled water. Dilute to 1 liter.

(2) Neutral phosphate buffer solution (0.025 M with respect to each phosphate salt, pH=6.86 at 25 °C. (77 °F.)). Dissolve 3.40 g. of potassium dihydrogen phosphate (KH\(_2\)PO\(_4\)) and 3.55 g. of anhydrous disodium hydrogen phosphate (Na\(_2\)HPO\(_4\)) in distilled water.

(3) Borax buffer solution (0.01 M, pH=9.18 at 25 °C. (77 °F.)). Dissolve 3.81 g. of disodium tetraborate decahydrate (Na\(_2\)B\(_4\)O\(_7\cdot10\)H\(_2\)O) in distilled water, and dilute to 1 liter. Stopper the bottle except when actually in use.

(4) Alkaline phosphate buffer solution (0.01 M trisodium phosphate, pH=11.72 at 25 °C. (77 °F.)). Dissolve 1.42 g. of anhydrous disodium hydrogen phosphate (Na\(_2\)HPO\(_4\)) in 100 ml. of a 0.1 M carbonate-free solution of sodium hydroxide. Dilute to 1 liter with distilled water.

(5) Potassium chloride electrolyte. Prepare a saturated solution of potassium chloride (KCl) in distilled water.

(c) Ethanol-water mixture. To 80 parts by volume of ethanol (S7.3) add 20 parts by volume of distilled water. Adjust the pH of the mixture to 7 ±0.1 using 0.1 N sodium hydroxide (NaOH) solution. If more than 4 ml. of NaOH solution per liter of mixture is required for neutralization, discard the mixture.

S6.4.4 Preparation of electrode system.

(a) Maintenance of electrodes. Clean the glass electrode before using by immersing in cold chromic-acid cleaning solution. Drain the calomel electrode and fill with KCl electrolyte, keeping the level above that of the mixture at all times. When not in use,immerse the lower halves of the electrodes in distilled water, and do not immerse in the mixture for any appreciable period of time between determinations.

(b) Preparation of electrodes. Condition new glass electrodes and those that have been stored dry as recommended by the manufacturer. Before and after using, wipe the glass electrode thoroughly with a clean cloth, or a soft absorbent tissue, and rinse with distilled water. Before each pH determination, soak the prepared electrode in distilled water for at least 2 minutes. Immediately before use, remove any excess water from the tips of the electrode.

S6.4.5 Standardization of the pH assembly and testing of the electrodes. (a) Immediately before use, standardize the pH assembly with a standard buffer solution. Then use a second standard buffer solution to check the linearity of the response of the electrodes at different pH values, and to detect a faulty
§ 571.116  

S6.4.6 Procedure. To 50 ±1 ml of the test brake fluid add 50 ±1 ml of the ethanol-water (S6.4.3(c)) and mix thoroughly. Immerse the electrodes in the mixture. Allow the system to come to equilibrium, readjust the temperature compensation if necessary, and take the pH reading.

S6.5 Fluid stability. Evaluate the heat and chemical stability of a brake fluid by the following procedure, running duplicate samples for each test and averaging the results.

S6.5.1 Summary of the procedure. The degradation of the brake fluid at elevated temperature, alone or in a mixture with a reference fluid, is evaluated by determining the change in boiling point after a period of heating under reflux conditions.

S6.5.2 Apparatus. Use the apparatus and preparation specified in S6.1.2 and S6.1.3.

S6.5.3 High temperature stability.

S6.5.3.1 Procedure. (a) Heat a new 60 ±1 ml sample of the brake fluid to 185° ±2 °C. (365° ±3.6 °F.). Hold at this temper-erature for 120 ±5 minutes. Bring to a reflux rate in excess of 1 drop per second within 5 minutes. The reflux rate should not exceed 5 drops per second at any time. Over the next 5 ±2 minutes adjust the heating rate to obtain an equilibrium reflux rate of 1 to 2 drops per second. Maintain this rate for an additional 2 minutes, taking four temperature readings at 30-second intervals. Average these as the observed ERBP. If no reflux is evident when the fluid temperature reaches 260 °C. (500 °F), discontinue heating and report ERBP as in excess of 260 °C. (500 °F.).

S6.5.3.2 Calculation. Correct the observed ERBP for thermometer and barometric pressure factors according to S6.1.5 (a) and (b). Average the corrected ERBP’s of the duplicate samples. The difference between this average and the original ERBP obtained in S6.1 is the change in ERBP of the fluid.

S6.5.4 Chemical stability.

S6.5.4.2 Procedure. (a) Mix 30 ±1 ml. of the brake fluid with 30 ±1 ml. of SAE RM–66–04 Compatibility Fluid in a boiling point flask (S6.1.2(a)). Determine the initial ERBP of the mixture by applying heat to the flask so that the fluid is refluxing in 10 ±2 minutes at a rate in excess of 1 drop per second, but not more than 5 drops per second. Note the maximum fluid temperature observed during the first minute after the fluid begins refluxing at a rate in excess of 1 drop per second. Over the next 15 ±1 minutes, adjust and maintain the reflux rate at 1 to 2 drops per second. Maintain this rate for an additional 2 minutes, recording the average value of four temperature readings taken at 30 second intervals as the final ERBP.

(b) Thermometer and barometric corrections are not required.

S6.5.4.3 Calculation. The difference between the initial ERBP and the final average temperature is the change in temperature of the refluxing mixture.
Average the results of the duplicates to the nearest 0.5 °C (1.0 °F).

S6.6 Corrosion. Evaluate the corrosiveness of a brake fluid by running duplicate samples according to the following procedure.

S6.6.1 Summary of the procedure. Six specified metal corrosion test strips are polished, cleaned, and weighed, then assembled as described. Assembly is placed on a standard wheel cylinder cup in a corrosion test jar, immersed in the water-wet brake fluid, capped and placed in an oven at 100 °C (212 °F) for 120 hours. Upon removal and cooling, the strips, fluid, and cups are examined and tested.

S6.6.2 Equipment. (a) Balance. An analytical balance having a minimum capacity of 50 grams and capable of weighing to the nearest 0.1 mg.
(b) Desiccators. Desiccators containing silica gel or other suitable desiccant.
(c) Oven. Gravity convection oven capable of maintaining the desired set point within 2 °C (3.6 °F).
(d) Micrometer. A machinist’s micrometer 25 to 50 mm. (1 to 2 inches) capacity, or an optical comparator, capable of measuring the diameter of the SBR wheel cylinder (WC) cups to the nearest 0.02 mm. (0.001 inch).

S6.6.3 Materials. (a) Corrosion test strips. Two sets of strips from each of the metals listed in appendix C of SAE Standard J1703b. Each strip shall be approximately 8 cm. long, 1.3 cm. wide, not more than 0.6 cm. thick, and have a surface area of 25 ±5 sq. cm. and a hole 4 to 5 mm. (0.16 to 0.20 inch) in diameter on the centerline about 6 mm. from one end. The hole shall be clean and free from burrs. Tinned iron strips shall be unused. Other strips, if used, shall not be employed if they cannot be polished to a high finish.
(b) SBR cups. Two unused standard SAE SBR wheel cylinder (WC) cups, as specified in S7.6.
(c) Corrosion test jars and lids. Two screw-top straight-sided round glass jars, each having a capacity of approximately 475 ml. and inner dimensions of approximately 100 mm. in height and 75 mm. in diameter, and a tinned steel lid (no insert or organic coating) vented with a hole 0.8 ±0.1 mm. (0.031 ±0.004 inch) in diameter (No. 68 drill).

(d) Machine screws and nuts. Clean, rust and oil-free, uncoated mild steel round or fillister head machine screws, size 6 or 8–32 UNC-Class 2A, five-eighths or three-fourths inch long (or equivalent metric sizes), and matching uncoated nuts.
(e) Supplies for polishing strips. Waterproof silicon carbide paper, grit No. 320A and grit 1200; lint-free polishing cloth.
(f) Distilled water as specified in S7.1.
(g) Ethanol as specified in S7.3.
(h) Isopropanol as specified in S7.7.

S6.6.4 Preparation. (a) Corrosion test strips. Except for the tinned iron strips, abrade corrosion test strips on all surface areas with 320A silicon carbide paper wet with ethanol (isopropanol when testing DOT 5 SBBF fluids) until all surface scratches, cuts and pits visible to an observer having corrected visual acuity of 20/40 (Snellen ratio) at a distance of 300 mm (11.8 inches) are removed. Use a new piece of paper for each different type of metal. Except for the tinned iron strips, further abrade the test strips on all surface areas with 1200 silicon carbide paper wet with ethanol (isopropanol when testing DOT 5 SBBF fluids), again using a new piece of paper for each different type of metal. Handle the strips with forceps after polishing. Weigh and record the weight of each strip to the nearest 0.1 mg. Assemble the strips on a clean dry machine screw, with matching plain nut, in the order of tinned iron, steel, aluminum, cast iron, brass, and copper. Bend the strips, other than the cast iron, so that there is a separation of 3 ±1⁄2 mm. (1⁄8 ±1⁄64 inch) between adjacent strips for a distance of about 5 cm. (2 inches) from the free end of the strips. (See Figure 4.) Tighten the screw on each test strip assembly so that the strips are in electrolytic contact, and can be lifted by either of the outer strips (tinned iron or copper) without any of the strips moving relative to the others when held horizontally. Immerse the strip assemblies in 90 percent ethyl alcohol. Dry with dried filtered compressed air, then desiccate at least 1 hour before use.
FIG. 4—CORROSION STRIP ASSEMBLY

(b) SBR WC cups. Measure the base diameters of the two standard SBR cups, using an optical comparator or micrometer, to the nearest 0.02 mm. (0.001 inch) along the centerline of the SAE and rubber-type identifications and at right angles to this centerline. Take the measurements at least 0.4 mm. (0.015 inch) above the bottom edge and parallel to the base of the cup. Discard any cup if the two measured diameters differ by more than 0.08 mm. (0.003 inch). Average the two readings on each cup. Determine the hardness of the cups according to S7.4.

S6.6.5 Procedure. Rinse the cups in ethanol (isopropanol when testing DOT 5 SBBF fluids) for not more than 30 seconds and wipe dry with a clean lint-free cloth. Place one cup with lip edge facing up, in each jar. Insert a metal strip assembly inside each cup with the fastened end down and the free end extending upward. (See Figure 5.) When testing brake fluids, except DOT 5 SBBF, mix 760 ml. of brake fluid with 40 ml. of distilled water. When testing DOT 5 SBBF’s, humidify 800 ml. of brake fluid in accordance with S6.2, eliminating determination of the ERBP. Using this water-wet mixture, cover each strip assembly to a minimum depth of 10 mm. above the tops of the strips. Tighten the lids and place the jars for 120 ± 2 hours in an oven maintained at 100 ± 2 °C. (212 ± 3.6 °F.). Allow the jars to cool at 23 ± 5 °C. (73.4 ± 9 °F.) for 60 to 90 minutes. Immediately remove the strips from the jars using forceps, agitating the strip assembly in the fluid to remove loose adhering sediment. Examine the test strips and jars for adhering crystalline deposits. Disassemble the metal strips, and remove adhering fluid by flushing with water; clean each strip by wiping with a clean cloth wetted with ethanol (isopropanol when testing DOT 5 fluids). Examine the strips for evidence of corrosion and pitting. Disregard staining or discoloration. Place the strips in a desiccator containing silica gel or other suitable desiccant, maintained at 23 ± 5 °C. (73.4 ± 9 °F.), for at least 1 hour. Weigh each strip to the nearest 0.1 mg. Determine the change in weight of each metal strip. Average the results for the two strips of each type of metal. Immediately following the cooling period, remove the cups from the jars with forceps. Remove loose adhering sediment by agitation of the cups in the mixture. Rinse the cups in ethanol (isopropanol when testing DOT 5 fluids) and air-dry. Examine the cups for evidence of sloughing, blisters, and other forms of disintegration. Measure the base diameter and hardness of each cup within 15 minutes after removal from the mixture. Examine the mixture for gelling. Agitate the mixture to suspend and uniformly disperse sediment. From each jar, transfer a 100 ml. portion of the mixture to an ASTM cone-shaped centrifuge tube. Determine the percent sediment after centrifuging as described in S7.5. Measure the pH value of the corrosion text fluid according to S6.4.6. Measure the pH value of the test mixture according to S6.4.6.
S6.6 Calculation. (a) Measure the area of each type of test strip to the nearest square centimeter. Divide the average change in mass for each type by the area of that type.

(b) Note other data and evaluations indicating compliance with S5.1.6. In the event of a marginal pass on inspection by attributes, or of a failure in one of the duplicates, run another set of duplicate samples. Both repeat samples shall meet all requirements of S5.1.6.

S6.7 Fluidity and appearance at low temperatures. Determine the fluidity and appearance of a sample of brake fluid at each of two selected temperatures by the following procedure.

S6.7.1 Summary of procedure. Brake fluid is chilled to expected minimum exposure temperatures and observed for clarity, gelation, sediment, separation of components, excessive viscosity or thixotropy.

S6.7.2 Apparatus. (a) Oil sample bottle. Two clear flint glass 4-ounce bottles made especially for sampling oil and other liquids, with a capacity of approximately 125 ml., an outside diameter of 37 ±0.05 mm. and an overall height of 165 ±2.5 mm.

(b) Cold chamber. An air bath cold chamber capable of maintaining storage temperatures down to minus 55 °C. (minus 67 °F.) with an accuracy of ±2 °C. (3.6 °F.).

(c) Timing device. A timing device in accordance with S6.3.2(e).

S6.7.3 Procedure. (a) Place 100 ±1 ml. of brake fluid at room temperature in an oil sample bottle. Stopper the bottle with an unused cork and place in the cold chamber at the higher storage temperature specified in Table II (S5.1.7(c)). After 144 ±4 hours remove the bottle from the chamber, quickly wipe it with a clean, lint-free cloth, saturated with ethanol (isopropanol when testing DOT 5 fluids) or acetone. Examine the fluid for evidence of sludging, sedimentation, crystallization, or stratification. Invert the bottle and determine the number of seconds required for the air bubble to travel to the top of the fluid. Let sample warm to room temperature and examine.

(b) Repeat S6.7.3(a), substituting the lower cold chamber temperature specified in Table II, and a storage period of 6 hours ±12 minutes.

NOTE: Test specimens from either storage temperature may be used for the other only after warming up to room temperature.

S6.8 [Reserved]

S6.9 Water tolerance. Evaluate the water tolerance characteristics of a brake fluid by running one test specimen according to the following procedure.

S6.9.1 Summary of the procedure. Brake fluid, except DOT 5 SBBF, is diluted with 3.5 percent water (DOT 5 SBBF is humidified), then stored at minus 40 °C. (minus 40 °F.) for 120 hours. The cold, water-wet fluid is first examined for clarity, stratification, and sedimentation, then placed in an oven at 60 °C. (140 °F.) for 24 hours. On removal, it is again examined for stratification, and the volume percent of sediment determined by centrifuging.

S6.9.2 Apparatus. (a) Centrifuge tube. See S7.5.1(a).

(b) Centrifuge. See S7.5.1(b).

(c) Cold chamber. See S6.7.2(b).

(d) Oven. Gravity or forced convection oven.

(e) Timing device. See S6.3.2(e).

S6.9.3 Procedure. (a) At low temperature. Humidify 100 ±1 ml. of DOT 5 SBBF brake fluid in accordance with S6.2 eliminating determination of the ERBP. When testing brake fluids except DOT 5 SBBF, mix 3.5 ±0.1 ml. of distilled water with 100 ±1 ml. of the brake fluid; pour into a centrifuge tube. Stopper the tube with a
clean cork and place in the cold chamber maintained at minus 40 ±2 °C. After 120 hours ±2 hours remove the tube, quickly wipe with clean lint-free cloth saturated with ethanol or acetone and examine the fluid for evidence of sludging, sedimentation, crystallization, or stratification. Invert the tube and determine the number of seconds required for the air bubble to travel to the top of the fluid. (The air bubble is considered to have reached the top of the fluid when the top of the bubble reaches the 2 ml. graduation of the centrifuge tube.) If the wet fluid has become cloudy, warm to 23 ±5 °C. (73.4 ±9 °F.) and note appearance and fluidity.

(b) At 60 °C. (140 ±2 °F.). Place tube and brake fluid from S6.9.3(a) in an oven maintained at 60 ±2 °C. (140 ±3.6 °F.) for 24 ±2 hours. Remove the tube and immediately examine the contents for evidence of stratification. Determine the percent sediment by centrifuging as described in S7.5.

§571.116 Compatibility. The compatibility of a brake fluid with other brake fluids shall be evaluated by running one test sample according to the following procedure.

S6.10.1 Summary of the procedure. Brake fluid is mixed with an equal volume of SAE RM–66–04 Compatibility Fluid, then tested in the same way as for water tolerance (S6.9) except that the bubble flow time is not measured. This test is an indication of the compatibility of the test fluid with other motor vehicle brake fluids at both high and low temperatures.

S6.10.2 Apparatus and materials.
(a) Centrifuge tube. See S7.5.1(a).
(b) Centrifuge. See S7.5.1(b).
(c) Cold Chamber. See S6.7.2(b)
(d) Oven. See S6.9.2(d)

S6.10.3 Procedure.
(a) At low temperature.
Mix 50 ±0.5 mL of brake fluid with 50 ±0.5 mL of SAE RM–66–04 Compatibility Fluid. Pour this mixture into a centrifuge tube and stopper with a clean dry cork. Place tube in the cold chamber maintained at minus 40 °C. (minus 40 ±3.6 °F.). After 24 ±2 hours remove tube, quickly wipe with a clean lint-free cloth saturated with ethanol (isopropanol when testing DOT 5 fluids) or acetone. Examine the test specimen for evidence of sludging, sedimentation, or crystallization. Test fluids, except DOT 5 SBBF, shall be examined for stratification.

S6.11 Resistance to oxidation. The stability of a brake fluid under oxidative conditions shall be evaluated by running duplicate samples according to the following procedure.

S6.11.1 Summary of procedure. Brake fluids, except DOT 5 SBBF, are activated with a mixture of approximately 0.2 percent benzoyl peroxide and 5 percent water. DOT 5 SBBF is humidified in accordance with S6.2 eliminating determination of the ERBP, and then approximately 0.2 percent benzoyl peroxide is added. A corrosion test strip assembly consisting of cast iron and an aluminum strip separated by tinfoil squares at each end is then rested on a piece of SBR WC cup positioned so that the test strip is half immersed in the fluid and oven aged at 70 °C. (158 °F.) for 168 hours. At the end of this period, the metal strips are examined for pitting, etching, and loss of mass.

S6.11.2 Equipment.
(a) Balance. See S6.6.2(a).
(b) Desiccators. See S6.6.2(b).
(c) Oven. See S6.6.2 (c).
(d) Three glass test tubes approximately 22 mm. outside diameter by 175 mm. in length.

S6.11.3 Reagents and materials.
(a) Benzoyl peroxide, reagent grade, 96 percent. (Benzoyl peroxide that is brownish, or dusty, or has less than 90 percent purity, must be discarded.) Reagent strength may be evaluated by ASTM E298–68, “Standard Methods for Assay of Organic Peroxides.”
(b) Corrosion test strips. Two sets of cast iron and aluminum metal test strips as described in appendix C of SAE Standard J1703b.
(c) Tinfoil. Four unused pieces of tinfoil approximately 12 mm. (½ inch) square and between 0.02 and 0.06 mm. (0.0008 and 0.0024 inch) in thickness.
§571.116

49 CFR Ch. V (10–1–08 Edition)

The foil shall be at least 99.9 percent tin and contain not more than 0.025 percent lead.

(d) SBR cups. Two unused, approximately one-eighth sections of a standard SAE SBR WC cup (as described in S7.6).

(e) Machine screw and nut. Two clean oil-free, No. 6 or 8–32\%–\% or \%–\%–\% inch long (or equivalent metric size), round or fillister head, uncoated mild steel machine screws, with matching plain nuts.

S6.11.4 Preparation.

(a) Corrosion test strips. Prepare two sets of aluminum and cast iron test strips according to S6.6.4(a) except for assembly. Weigh each strip to the nearest 0.1 mg. and assemble a strip of each metal on a machine screw, separating the strips at each end with a piece of tinfoil. Tighten the nut enough to hold both pieces of foil firmly in place.

(b) Test mixture. Place 30 ±1 ml. of the brake fluid under test in a 22 by 175 mm. test tube. For all fluids except DOT 5 SBBF, add 0.060 ±0.002 grams of benzoyl peroxide, and 1.50 ±0.05 ml. of distilled water. For DOT 5 SBBF, use test fluid humidified in accordance with S6.2, and add only the benzoyl peroxide. Stopper the tube loosely with a clean dry cork, shake, and place in an oven for 2 hours at 70 ±5 °C. (158 ±9 °F.). Shake every 15 minutes to effect solution of the peroxide, but do not wet cork. Remove the tube from the oven and allow to cool to 23 ±5 °C. (73.4 ±9 °F.). Begin testing according to paragraph S6.11.5 not later than 24 hours after removal of tube from oven.

S6.11.5 Procedure. Place a one-eighth SBR cup section in the bottom of each tube. Add 10 ml. of prepared test mixture to each test tube. Place a metal-foil strip assembly in each, the end of the strip without the screw resting on the rubber, and the solution covering about one-half the length of the strips. Stopper the tubes with clean dry corks and store upright for 70 ±2 hours at 23 ±5 °C. (73.4 ±9 °F.). Loosen the corks and place the tubes for 168 ±2 hours in an oven maintained at 70 ±2 °C. (158 ±3.6 °F.). Afterwards remove and disassemble strips. Examine the strips and note any gum deposits. Wipe the strips with a clean cloth wet with ethanol (isopropanol when testing DOT 5 fluids) and note any pitting, etching or roughening of surface disregarding stain or discoloration. Place the strips in a desiccator over silica gel or other suitable desiccant, at 23 ±5 °C. (73.4 ±9 °F.), for at least 1 hour. Again weigh each strip to the nearest 0.1 mg.

S6.11.6 Calculation. Determine corrosion loss by dividing the change in mass of each metal strip by the total surface area of each strip measured in square millimeters (mm²), to the nearest square millimeter (mm²). Average the results for the two strips of each type of metal, rounding to the nearest 0.05 mg. per 100 square millimeter (mm²). If only one of the duplicates fails for any reason, run a second set of duplicate samples. Both repeat samples shall meet all requirements of S5.1.11.

S6.12 Effect on SBR cups. The effects of a brake fluid in swelling, softening, and otherwise affecting standard SBR WC cups shall be evaluated by the following procedure.

S6.12.1 Summary of the procedure. Four standard SAE SBR WC cups are measured and their hardesses determined. The cups, two to a jar, are immersed in the test brake fluid. One jar is heated for 70 hours at 70 °C. (156 °F), and the other for 70 hours at 120 °C (248 °F). Afterwards, the cups are washed, examined for disintegration, remeasured and their hardesses redetermined.

S6.12.2 Equipment and supplies.

(a) Oven. See S6.6.2(c).

(b) Glass jars and lids. Two screw-top, straight-sided round glass jars, each having a capacity of approximately 250 ml. and inner dimensions of approximately 125 mm. in height and 50 mm. in diameter, and a tinned steel lid (no insert or organic coating).

(c) SBR cups. See S7.6.

S6.12.3 Preparation. Measure the base diameters of the SBR cups as described in S6.6.4(b), and the hardness of each as described in S7.4.

S6.12.4 Procedure. Wash the cups in 90 percent ethanol (isopropanol when testing DOT 5 fluids) (see S7.3), for not longer than 30 seconds and quickly dry with a clean, lint-free cloth. Using forceps, place two cups into each of the two jars; add 75 ml. of brake fluid to each jar and cap tightly. Place one jar in an oven held at 70 ±2 °C. (158 ±3.6
"F.) for 70 ± 2 hours. Place the other jar in an oven held at 120° ± 2 °C. (248° ±3.6 °F.) for 70 ± 2 hours. Allow each jar to cool for 60 to 90 minutes at 23° ± 5 °C. (73.4° ±9 °F.). Remove cups, wash with ethanol (isopropanol when testing DOT 5 fluids) for not longer than 30 seconds, and quickly dry. Examine the cups for disintegration as evidenced by stickiness, blisters, or sloughing. Measure the base diameter and hardness of each cup within 15 minutes after removal from the fluid.

S6.12.5 Calculation. (a) Calculate the change in base diameter for each cup. If the two values, at each temperature, do not differ by more than 0.10 mm. (0.004 inch) average them to the nearest 0.02 mm. (0.001 inch). If the two values differ by more than 0.10 mm., repeat the test at the appropriate temperature and average the four values as the change in base diameter.

(b) Calculate the change in hardness for each cup. The average of the two values for each pair is the change in hardness.

(c) Note disintegration as evidenced by stickiness, blisters, or sloughing.

S6.13 Stroking properties. Evaluate the lubricating properties, component compatibility, resistance to leakage, and related qualities of a brake fluid by running one sample according to the following procedures.

S6.13.1 Summary of the procedure. Brake fluid is stroked under controlled conditions at an elevated temperature in a simulated motor vehicle hydraulic braking system consisting of three slave wheel cylinders and an actuating master cylinder connected by steel tubing. Referee standard parts are used. All parts are carefully cleaned, examined, and certain measurements made immediately prior to assembly for test. During the test, temperature, rate of pressure rise, maximum pressure, and rate of stroking are specified and controlled. The system is examined periodically during stroking to assure that excessive leakage of fluid is not occurring. Afterwards, the system is torn down. Metal parts and SBR cups are examined and remeasured. The brake fluid and any resultant sludge and debris are collected, examined, and tested.

S6.13.2 Apparatus and equipment.

Either the drum and shoe type of stroking apparatus (see Figure 1 of SAE Standard J1703b) except using only three sets of drum and shoe assemblies, or the stroking fixture type apparatus as shown in Figure 2 of SAE J1703Nov83, with the components arranged as shown in Figure 1 of SAE J1703Nov83. The following components are required.

(a) Brake assemblies. With the drum and shoe apparatus: three drum and shoe assembly units (SAE RM–29a) consisting of three forward brake shoes and three reverse brake shoes with linings and three front wheel brake drum assemblies with assembly component parts. With stroking fixture type apparatus: three fixture units including appropriate adapter mounting plates to hold brake wheel cylinder assemblies.

(b) Braking pressure actuation mechanism. An actuating mechanism for applying a force to the master cylinder pushrod without side thrust. The amount of force applied by the actuating mechanism shall be adjustable and capable of applying sufficient thrust to the master cylinder to create a pressure of at least 6895 kPa (1,000 p.s.i.) in the simulated brake system. A hydraulic gage or pressure recorder, having a range of at least 0 to 6895 kPa (0 to 1,000 p.s.i), shall be installed between the master cylinder and the brake assemblies and shall be provided with a shutoff valve and with a bleeding valve for removing air from the connecting tubing. The actuating mechanism shall be designed to permit adjustable stroking rates of approximately 1,000 strokes per hour. Use a mechanical or electrical counter to record the total number of strokes.

(c) Heated air bath cabinet. An insulated cabinet or oven having sufficient capacity to house the three mounted brake assemblies or stroking fixture assemblies, master cylinder, and necessary connections. A thermostatically controlled heating system is required to maintain a temperature of 70° ±5 °C (158° ±9 °F) or 120° ±5 °C (248° ±9 °F). Heaters shall be shielded to prevent direct radiation to wheel or master cylinder.
(d) **Master cylinder (MC) assembly (SAE RM–15a).** One cast iron housing hydraulic brake system cylinder having a diameter of approximately 28 mm. (1 1/8 inch) and fitted for a filler cap and standpipe (see S6.13.2(e)). The MC piston shall be made from SAE CA360 copperbase alloy (half hard). A new MC assembly is required for each test.

(e) **Filler cap and standpipe.** MC filler cap provided with a glass or uncoated steel standpipe. Standpipe must provide adequate volume for thermal expansion, yet permit measurement and adjustment of the fluid level in the system to ±3 ml. Cap and standpipe may be cleaned and reused.

(f) **Wheel cylinder (WC) assemblies (SAE RM–14a).** Three unused cast iron housing straight bore hydraulic brake WC assemblies having diameters of approximately 28 mm (1 1/8 inch) for each test. Pistons shall be made from unanodized SAE AA 2024 aluminum alloy.

(g) **Micrometer.** Same as S6.6.2(d).

S6.13.3 **Materials.**

(a) **Standard SBR brake cups.** Six standard SAE SBR wheel cylinder test cups, one primary MC test cup, and one secondary MC test cup, all as described in S7.6, for each test.

(b) **Steel tubing.** Double wall steel tubing meeting SAE specification J527. A complete replacement of tubing is essential when visual inspection indicates any corrosion or deposits on inner surface of tubing. Tubing from master cylinder to one wheel cylinder shall be replaced for each test (minimum length 9 m.) Uniformity in tubing size is required between master cylinder and wheel cylinder. The standard master cylinder has two outlets for tubing, both of which must be used.

S6.13.4 **Preparation of test apparatus.**

(a) **Wheel cylinder assemblies.** Use unused wheel cylinder assemblies. Disassemble cylinders and discard cups. Clean all metal parts with ethanol (isopropanol when testing DOT 5 fluids). Inspect the working surfaces of all metal parts for scoring, galling, or pitting and cylinder bore roughness, and discard all defective parts. Remove any stains on cylinder walls with crocus cloth and ethanol (isopropanol when testing DOT 5 fluids). If stains cannot be removed, discard the cylinder. Measure the internal diameter of each cylinder at a location approximately 19 mm. (0.75 inch) from each end of the cylinder bore, taking measurements in line with the hydraulic inlet opening and at right angles to this centerline. Discard the cylinder if any of these four readings exceeds the maximum or minimum limits of 28.66 to 28.60 mm. (1.128 to 1.126 inch). Measure the outside diameter of each piston at two points approximately 90° apart. Discard any piston if either reading exceeds the maximum or minimum limits of 28.55 to 28.52 mm. (1.124 to 1.123 inch). Select parts to insure that the clearance between each piston and mating cylinder is within 0.08 to 0.13 mm. (0.003 to 0.005 inch). Use unused SBR cups. To remove dirt and debris, rinse the cups in 90 percent ethyl alcohol for not more than 30 seconds and wipe dry with a clean lint-free cloth. Discard any cups showing defects such as cuts, molding flaws, or blisters. Measure the lip and base diameters of all cups with an optical comparator or micrometer to the nearest 0.02 mm. (0.001 inch) along the centerline of the SAE and rubber-type identifications and at right angles to this centerline. Determine base diameter measurements at least 0.4 mm. (0.015 inch) above the bottom edge and parallel to the base of the cup. Discard any cup if the two measured lip or base diameters differ by more than 0.08 mm. (0.003 inch). Average the lip and base diameters of each cup. Determine the hardness of all cups according to S7.4. Dip the rubber and metal parts of wheel cylinders, except housing and rubber boots, in the fluid to be tested and install them in accordance with the manufacturer’s instructions. Manually stroke the cylinders to insure that they operate easily. Install cylinders in the simulated brake system.

(b) **Master cylinder assembly.** Use an unused master cylinder and unused standard SBR primary and secondary MC cups which have been inspected, measured and cleaned in the manner specified in S6.13.4(a), omitting hardness of the secondary MC cup. However, prior to determining the lip and base diameters of the secondary cup, dip the cup in test brake fluid, assemble on the MC piston, and maintain the assembly in a vertical position at 23° ± 15
procedure. Operate the system for 16,000 ±1,000 cycles at 23° ± 5° C. (73.4° ± 9° F.). Repair any leakage, readjust the brake shoe clearances, and add fluid to the master cylinder standpipe to bring to the level originally recorded, if necessary. Start the test again and raise the temperature of the cabinet within 6 ± 2 hours to 120° ± 5° C. (248° ± 9° F.). During the test observe operation of wheel cylinders for improper functioning and record the amount of fluid required to replenish any loss, at intervals of 24,000 strokes. Stop the test at the end of 85,000 total recorded strokes. These totals shall include the number of strokes during operation at 23° ± 5° C. (73.4° ± 9° F.) and the number of strokes required to bring the system to the operating temperature. Allow equipment to cool to room temperature. Examine the wheel cylinders for leakage. Stroke the assembly an additional 100 strokes, examine wheel cylinders for leakage and record volume loss of fluid. Within 16 hours after stopping the test, remove the master and wheel cylinders from the system, retaining the fluid in the cylinders by immediately capping or plugging the ports. Disassemble the cylinders, collecting the fluid from the master cylinder and wheel cylinders in a glass jar. When collecting the stroked fluid, remove all residue which has deposited on rubber and metal internal parts by rinsing and agitating such parts in the stroked fluid and using a soft brush to assure that all loose adhering sediment is collected. Clean SBR cups in ethanol (isopropanol when testing DOT 5 fluids) and dry. Inspect the cups for stickiness, scuffing, blistering, cracking, chipping, and change in shape from original appearance. Within 1 hour after disassembly, measure the lip and base diameters of each cylinder cup by the procedures specified in §6.13.4 (a) and (b) with the exception that lip or base diameters of cups may now differ by more than 0.08 mm. (0.003 inch). Determine the hardness of each cup according to §7.4. Note any sludge or gel present in the test fluid. Within 1 hour after draining the cylinders, agitate the fluid in a glass jar to suspend and
uniformly disperse sediment and transfer a 100 ml. portion of this fluid to a centrifuge tube and determine percent sediment as described in S7.5. Allow the tube and fluid to stand for 24 hours, recentrifuge and record any additional sediment recovered. Inspect cylinder parts, note any gumming or any pitting on pistons and cylinder walls. Disregard staining or discoloration. Rub any deposits adhering to cylinder walls with a clean soft cloth wetted with ethanol (isopropanol when testing DOT 5 fluids) to determine abrasiveness and removability. Clean cylinder parts in ethanol (isopropanol when testing DOT 5 fluids) and dry. Measure and record diameters of pistons and cylinders according to S6.13.4(a) and (b). Repeat the test if mechanical failure occurs that may affect the evaluation of the brake fluid.

S6.13.6 Calculation.
(a) Calculate the changes in diameters of cylinders and pistons (see S5.1.13(b)).
(b) Calculate the average decrease in hardness of the seven cups tested, as well as the individual values (see S5.1.13(c)).
(c) Calculate the increases in base diameters of the eight cups (see S5.1.13(e)).
(d) Calculate the lip diameter interference set for each of the eight cups by the following formula and average the eight values (see S5.1.13(f)).

\[
\left(\frac{D_1 - D_2}{D_1 - D_3}\right) \times 100 = \text{Percentage Lip Diameter Interference Set}
\]

where:

- \(D_1\) = Original lip diameter.
- \(D_2\) = Final lip diameter.
- \(D_3\) = Original cylinder bore diameter.

S6.14 Container information. Each container with information marked directly on the container surface or on a label (labels) affixed to the container pursuant to S5.2.2.2 or S5.2.2.3 is subjected to the following procedure:

(a) If the container has a label affixed to it, make a single vertical cut all the way through the label with the container in the vertical position.

(b) Immerse the container in the same brake fluid or hydraulic system mineral oil contained therein for 15 minutes at room temperature (23 ± 2°C; 73.4 ± 9°F).

(c) Within 5 minutes after removing the container from the fluid or oil, remove excess liquid from the surface of the container by wiping with a clean dry cloth.

S7. Auxiliary test methods and reagent standards.

S7.2 Water content of motor vehicle brake fluids. Use analytical methods based on ASTM D1123-59, “Standard Method of Test for Water in Concentrated Engine Antifreezes by the Iodine Reagent Method,” for determining the water content of brake fluids, or other methods of analysis yielding comparable results. To be acceptable for use, such other method must measure the weight of water added to samples of the SAE RM-66-84 and TEGME Compatibility Fluids within ±15 percent of the water added for additions up to 0.8 percent by weight, and within ±5 percent of the water added for additions greater than 0.8 percent by weight. The SAE RM-66-04 Compatibility Fluid used to prepare the samples must have an original ERBP of not less than 205 °C (401 °F) when tested in accordance with S6.1. The SAE TEGME fluid used to prepare the samples must have an original ERBP of not less than 240 °C (464 °F) when tested in accordance with S6.1.

S7.3 Ethanol. 95 percent (190 proof) ethyl alcohol, USP or ACS, or Formula 3-A Specially Denatured Alcohol of the same concentration (as specified at 27 CFR 21.35). For pretest washings of equipment, use approximately 90 percent ethyl alcohol, obtained by adding 5 parts of distilled water to 95 parts of ethanol.

S7.4 Measuring the hardness of SBR brake cups. Hardness measurements on SBR wheel cylinder cups and master cylinder primary cups shall be made by using the following apparatus and the following procedure.

S7.4.1 Apparatus.

(a) Anvil. A rubber anvil having a flat circular top 20 ± 1 mm. (¾ ± ¼ inch) in diameter, a thickness of at least 9 mm. (¾ inch) and a hardness within 5 IRHDs of the SBR test cup.
(b) **Hardness tester.** A hardness tester meeting the requirements for the standard instrument as described in ASTM D1415–68, "Standard Method of Test for International Hardness of Vulcanized Natural and Synthetic Rubbers," and graduated directly in IRHD units.

S7.4.2 *Procedure.* Make hardness measurements at 23° ± 2°C (73.4° ± 4°F). Equilibrate the tester and anvils at this temperature prior to use. Center brake cups lip side down on an anvil of appropriate hardness. Following the manufacturer’s operating instructions for the hardness tester, make one measurement at each of four points 6 mm from the center of the cup and spaced 90° apart. Average the four values, and round off to the nearest IRHD.

S7.5 *Sediment by centrifuging.* The amount of sediment in the test fluid shall be determined by the following procedure.

S7.5.1 **Apparatus.**

(a) **Centrifuge tube.** Cone-shaped centrifuge tubes conforming to the dimensions given in Figure 6, and made of thoroughly annealed glass. The graduations shall be numbered as shown in Figure 6, and shall be clear and distinct. Scale-error tolerances and smallest graduations between various calibration marks are given in Table V and apply to calibrations made with air-free water at 20°C (68°F).

(b) **Centrifuge.** A centrifuge capable of whirling two or more filled centrifuge tubes at a speed which can be controlled to give a relative centrifugal force (r.c.f.) between 600 and 700 at the tip of the tubes. The revolving head, trunnion rings, and trunnion cups, including the rubber cushion, shall withstand the maximum centrifugal force capable of being delivered by the power source. The trunnion cups and cushions shall firmly support the tubes when the centrifuge is in motion. Calculate the speed of the rotating head using this equation:
r.p.m. = \( 265\sqrt{25.4 \times \text{r.c.f.}}/d \)

Where:
- r.c.f. = Relative centrifugal force, and
- d = Diameter of swing, in millimeters, measured between tips of opposing tubes when in rotating position.

Table VI shows the relationship between diameter, swing, relative centrifugal force (r.c.f.), and revolutions per minute.

* Measured in millimeters between tips of opposite tubes when in rotating position.

**S7.5.2 Procedure.** Balance the corked centrifuge tubes with their respective trunnion cups in pairs by weight on a scale, according to the centrifuge manufacturer’s instructions, and place them on opposite sides of the centrifuge head. Use a dummy assembly when one sample is tested. Then whirl them for 10 minutes, at a rate sufficient to produce a r.c.f. between 600 and 700 at the tips of the whirling tubes. Repeat until the volume of sediment in each tube remains constant for three consecutive readings.

**S7.5.3 Calculation.** Read the volume of the solid sediment at the bottom of the centrifuge tube and report the percent sediment by volume. Where replicate determinations are specified, report the average value.

**S7.6 Standard styrene-butadiene rubber (SBR) brake cups.** SBR brake cups for testing motor vehicle brake fluids shall be manufactured using the following formulation:

*Philprene 1503 has been found suitable.

**(NBS is National Bureau of Standards.**

Compounding, vulcanization, physical properties, size of the finished cups, and other details shall be as specified in appendix B of SAE J1703b. The cups shall be used in testing brake fluids either within 6 months from date of manufacture when stored at room temperature below 30 °C (86 °F.) or within 36 months from date of manufacture when stored at temperatures below minus 15 °C (+5 °F.). After removal of cups from refrigeration they shall be conditioned base down on a flat surface for at least 12 hours at room temperature in order to allow cups to reach their true configuration before measurement.

**S7.7 Isopropanol.** ACS or reagent grade.

[36 FR 22902, Dec. 2, 1971]

**EDITORIAL NOTE: For FEDERAL REGISTER citations affecting §571.116, see the List of Sections Affected, which appears in the Finding Aids section of the printed volume and on GPO Access.**

**§571.117 Standard No. 117; Retreaded pneumatic tires.**

**S1. Scope.** This standard specifies performance, labeling, and certification requirements for retreaded pneumatic passenger car tires.

**S2. Purpose.** The purpose of this standard is to require retreaded pneumatic passenger car tires to meet safety criteria similar to those for new pneumatic passenger car tires.

**S3. Application.** This standard applies to retreaded pneumatic tires for use on passenger cars manufactured after 1948.

**S4. Definitions.**

**S4.1 Casing** means a used tire to which additional tread may be attached for the purpose of retreading.
Retreaded means manufactured by a process in which a tread is attached to a casing.

S4.2 All terms defined in §§571.109 and 571.110 are used as defined therein.

S5. Requirements.

S5.1 Retreaded tires.

S5.1.1 Except as specified in S5.1.3, each retreaded tire, when mounted on a test rim of the width specified for the tire’s size designation in appendix A of §571.109 shall comply with the following requirements of §571.109:

(a) S4.1 (Size and construction).
(b) S4.2.1 (General).
(c) S4.2.2.3 (Tubeless tire resistance to bead unseating).
(d) S4.2.2.4 (Tire strength).

S5.1.2 Except as specified in S5.1.3, each retreaded tire, when mounted on a test rim of the width specified for the tire’s size designation in appendix A of §571.109, shall comply with the requirements of S4.2.2.2 of §571.109, except that the tire’s section width shall not be more than 110 percent of the section width specified, and the tire’s size factor shall be at least 97 percent of the size factor specified, in appendix A of §571.109 for the tire’s size designation.

S5.1.3 Each retreaded tire shall be capable of meeting the requirements of S5.1.1 and S5.1.2 when mounted on any rim in accordance with those sections.

S5.1.4 No retreaded tire shall have a size designation, recommended maximum load rating, or maximum permissible inflation pressure that is greater than that originally specified on the casing pursuant to S4.3 of §571.109, or specified for the casing in Table I.

S5.2 Casings.

S5.2.1 No retreaded tire shall be manufactured with a casing—

(a) From which a belt or ply, or part thereof, is removed during processing; or

(b) On which a belt or ply, or part thereof, is added or replaced during processing.

S5.2.3 Each retreaded tire shall be manufactured with a casing that bears, permanently molded at the time of its original manufacture into or onto the tire sidewall, each of the following:

(a) The symbol DOT;
(b) The size of the tire; and
(c) The actual number of plies or ply rating.

S5.2.4 (Reserved)

S6 Certification and labeling.

S6.1 Each manufacturer of a retreaded tire shall certify that its product complies with this standard pursuant to Section 30115 of Title 49, United States Code, by labeling the tire with the symbol DOT in the location specified in section 574.5 of this chapter.

S6.2 (Reserved)

S6.3. Labeling. Each retreaded tire shall comply, according to the phase-in schedule specified in S7 of this standard, with the requirements of S5.5 and S5.5.1 of §571.139.

S7 Phase-In Schedule for labeling

S7.1. Tires retreaded on or after September 1, 2005 and before September 1, 2006. For tires manufactured on or after September 1, 2005 and before September 1, 2006, the number of tires complying with S6.3 of this standard must be equal to not less than 40% of the retreader’s production during that period.

S7.2. Tires retreaded on or after September 1, 2006 and before September 1, 2007. For tires manufactured on or after September 1, 2006 and before September 1, 2007, the number of tires complying with S6.3 of this standard must be equal to not less than 70% of the retreader’s production during that period.
§571.118

S7.3. Tires retreaded on or after September 1, 2007. Each tire must comply with S6.3 of this standard.

§571.118 Standard No. 118; Power-operated window, partition, and roof panel systems.

S1. Purpose and scope. This standard specifies requirements for power operated window, partition, and roof panel systems to minimize the likelihood of death or injury from their accidental operation.

S2. Application. This standard applies to passenger cars, multipurpose passenger vehicles, and trucks with a gross vehicle weight rating of 4,536 kilograms or less. This standard’s inadvertent actuation performance requirements of S6(a) need not be met for vehicles manufactured before October 1, 2008. The standard’s pull-to-close switch operability requirements of S6(c) need not be met for vehicles manufactured before October 1, 2010.

S3. Definitions.

Infrared reflectance means the ratio of the intensity of infrared light reflected and scattered by a flat sample of the test rod material to the intensity of infrared light reflected and scattered by a mirror that reflects 99.99 percent of the infrared radiation incident on its surface as measured by the apparatus shown in Figure 2.

Power operated roof panel systems mean moveable panels in the vehicle roof which close by vehicle supplied power either by a sliding or hinged motion, and do not include convertible top systems.

S4. Operating requirements. Except as provided in S5, power operated window, partition, or roof panel systems may be closed only in the following circumstances:

(a) When the key that controls activation of the vehicle’s engine is in the “ON”, “START”, or “ACCESSORY” position;

(b) By muscular force unassisted by vehicle supplied power;

(c) Upon continuous activation by a locking system on the exterior of the vehicle;

(d) Upon continuous activation of a remote actuation device, provided that the remote actuation device shall be incapable of closing the power window, partition or roof panel from a distance of more than 6 meters from the vehicle;

(e) During the interval between the time the locking device which controls the activation of the vehicle’s engine is turned off and the opening of either of a two-door vehicle’s doors or, in the case of a vehicle with more than two doors, the opening of either of its front doors;

(f) If the window, partition, or roof panel is in a static position before starting to close and in that position creates an opening so small that a 4 mm diameter semi-rigid cylindrical rod cannot be placed through the opening at any location around its edge in the manner described in S5(b); or

(g) Upon continuous activation of a remote actuation device, provided that the remote actuation device shall be incapable of closing the power window, partition or roof panel if the device and the vehicle are separated by an opaque surface and provided that the remote actuation device shall be incapable of closing the power window, partition or roof panel from a distance of more than 11 meters from the vehicle.

S5. Automatic reversal systems. A power-operated window, partition, or roof panel system that is capable of closing or of being closed under any circumstances other than those specified in S4 shall meet the requirements of S5.1, S5.2, and, if applicable, S5.3.

S5.1. While closing, the power-operated window, partition, or roof panel shall stop and reverse direction either before contacting a test rod with properties described in S8.2 or S8.3, or before exerting a squeezing force of 100 newtons (N) or more on a semi-rigid cylindrical test rod with the properties described in S8.1, when such test rod is placed through the window, partition, or roof panel opening at any location
in the manner described in the applicable test under S7.

S5.2. Upon reversal, the power-operated window, partition, or roof panel system must open to one of the following positions, at the manufacturer's option:

(a) A position that is at least as open as the position at the time closing was initiated;

(b) A position that is not less than 125 millimeters (mm) more open than the position at the time the window reversed direction; or

(c) A position that permits a semi-rigid cylindrical rod that is 200 mm in diameter to be placed through the opening at the same location as the rod described in S7.1 or S7.2(b).

S5.3. If a vehicle uses proximity detection by infrared reflection to stop and reverse a power-operated window, partition, or roof panel, the infrared source shall project infrared light at a wavelength of not less than 850 nm and not more than 1050 nm. The system shall meet the requirements in S5.1 and S5.2 in all ambient light conditions from total darkness to 64,500 lux (6,000 foot candles) incandescent light intensity.

§ 571.118 Actuation Devices. Except as provided in paragraph S6(b), actuation devices in the occupant compartments of vehicles used to close power-operated windows, partitions, and roof panels must meet the following requirements:

(a) An actuation device must not cause a window, partition, or roof panel to begin to close from any open position when tested as follows:

(1) Using a stainless steel sphere having a surface finish between 8 and 4 micro inches and a radius of 20 mm ± 0.2 mm, place the surface of the sphere against any portion of the actuation device.

(2) Apply a force not to exceed 135 Newtons (30 pounds) through the geometric center of the sphere. This force may be applied at any angle with respect to the actuation device.

(3) For actuation devices that cannot be contacted by the sphere specified in S6(a)(1) prior to the application of force, apply a force up to the level specified in S6(a)(2) at any angle in an attempt to make contact with the actuation device. The sphere is directionally applied in such a manner that, if unimpeded, it would make contact with the actuation device.

(b) The requirement in S6(a) does not apply to either—

(1) actuation devices that are mounted in a vehicle's roof, headliner, or overhead console that can close power-operated windows, partitions, or roof panels only by continuous rather than momentary switch actuation, or

(2) actuation devices for closing power-operated windows, partitions, or roof panels which comply with paragraph S5.

(c) Any actuation device for closing a power-operated window must operate by pulling away from the surface in the vehicle on which the device is mounted. An actuation device for closing a power-operated window must operate only when pulled vertically up (if mounted on the top of a horizontal surface), or out (if mounted on a vertical surface), or down (if mounted on the underside of an overhead surface), or in a direction perpendicular to the surrounding surface if mounted in a sloped orientation, in order to cause the window to move in the closing direction.

S7. Test procedures.

S7.1. Test procedure for testing power-operated window, partition, or roof panel systems designed to detect obstructions by physical contact or by light beam interruption: Place the test rod of the type specified in S8.1 or S8.2, as appropriate, through the window, partition, or roof panel opening from the inside of the vehicle such that the cylindrical surface of the rod contacts any part of the structure with which the window, partition, or roof panel mates. Typical placements of test rods are illustrated in Figure 1. Attempt to close the power window, partition, or roof panel by operating the actuation device provided in the vehicle for that purpose.

S7.2. Test procedure for testing power-operated window, partition, or roof panel systems designed to detect the proximity of obstructions using infrared reflectance:

(a) Place the vehicle under incandescent lighting that projects 64,500 lux (6,000 foot candles) onto the infrared sensor. The light is projected onto the infrared sensor by aiming the optical axis of a light source outside of the vehicle as perpendicular as possible to the
lens of the infrared sensor. The intensity of light is measured perpendicular to the plane of the lens of the infrared sensor, as close as possible to the center of the lens of the infrared sensor.

(b) Place a test rod of the type specified in S8.3 in the window, partition, or roof panel opening, with the window, partition, or roof panel in any position. While keeping the rod stationary, attempt to close the window, partition, or roof panel by operating the actuation device provided in the vehicle for that purpose. Remove the test rod. Fully open the window, partition, or roof panel, and then begin to close it. While the window, partition, or roof panel is closing, move a test rod so that it approaches and ultimately extends through (if necessary) the window, partition, or roof panel opening, or its frame, in any orientation from the interior of the vehicle. For power partitions that have occupant compartment space on both sides of the partition, move the test rod into the partition opening from either side of the partition.

(c) Repeat the steps in S7.2(a) and (b) with other ambient light conditions within the range specified in S8.3.

S8. Test rods.

S8.1. Rods for testing systems designed to detect obstructions by physical contact:

(a) Each test rod is of cylindrical shape with any diameter in the range from 4 mm to 200 mm and is of sufficient length that it can be hand-held during the test specified in S7 with only the test rod making any contact with any part of the window, partition, or roof panel or mating surfaces of the window, partition, or roof panel.

(b) Each test rod has a force-deflection ratio of not less than 65 N/mm for rods 25 mm or smaller in diameter, and not less than 20 N/mm for rods larger than 25 mm in diameter.

S8.2. Rods for testing systems designed to detect obstructions by light beam interruption: Each test rod has the shape and dimensions specified in S8.1 and is, in addition, opaque to infrared, visible, and ultraviolet light.

S8.3. Rods for testing systems designed to detect the proximity of obstructions using infrared reflection:

(a) Each rod is constructed so that its surface has an infrared reflectance of not more than 1.0 percent when measured by the apparatus in Figure 2, in accordance with the procedure in S9.

(b) Each rod has the shape and dimensions specified in Figure 3.

(a) The infrared reflectance of the rod surface material is measured using a flat sample and an infrared light source and sensor operating at a wavelength of 950 ± 100 nm.

(b) The intensity of incident infrared light is determined using a reference mirror of nominally 100 percent reflectance mounted in place of the sample in the test apparatus in Figure 2.

(c) Infrared reflectance measurements of each sample of test rod surface material and of the reference mirror are corrected to remove the contribution of infrared light reflected and scattered by the sample holder and other parts of the apparatus before computation of the infrared reflectance ratio.

for Testing Non-Contact Infrared Reflection Systems
§ 571.119 Standard No. 119; New pneumatic tires for motor vehicles with a GVWR of more than 4,536 kilograms (10,000 pounds) and motorcycles.

S1. Scope. This standard establishes performance and marking requirements for tires for use on motor vehicles with a GVWR of more than 10,000 pounds and motorcycles.

S2. Purpose. The purpose of this standard is to provide safe operational performance levels for tires used on motor vehicles with a GVWR of more than 10,000 pounds, trailers, and motorcycles, and to place sufficient information on the tires to permit their proper selection and use.

S3. Application. This standard applies to:

(a) New pneumatic tires for use on motor vehicles with a GVWR of more than 4,536 kilograms (10,000 pounds) manufactured after 1948;
(b) New pneumatic light truck tires with a tread depth of 18/32 inch or greater, for use on motor vehicles with a GVWR of 4,536 kilograms (10,000 pounds) or less manufactured after 1948;
(c) Tires for use on special-use trailers (ST, FI and 8–12 rim or lower diameter code); and
(d) Tires for use on motorcycles manufactured after 1948.

S4. Definitions. All terms defined in the Act and the rules and standards issued under its authority are used as defined therein.

Light truck tire means a tire designated by its manufacturer as primarily intended for use on lightweight trucks or multipurpose passenger vehicles.

Model rim assembly means a test device that (a) includes a rim which conforms to the published dimensions of a commercially available rim, (b) includes an air valve assembly when used for testing tubeless tires or an inner tube and flap (as required) when used for testing tubetype tires, and (c) undergoes no permanent rim deformation and allows no loss of air through the portion that it comprises of the tire-rim pressure chamber when a tire is properly mounted on the assembly and subjected to the requirements of this standard.

S5. Tire and rim matching information.

S5.1 Each manufacturer of tires shall ensure that a listing of the rims that may be used with each tire that he produces is provided to the public. For purposes of this section each rim listing shall include dimensional specifications and a diagram of the rim. However a listing compiled in accordance with paragraph (a) of this section need not include dimensional specifications or a diagram of a rim if the rim’s dimensional specifications and diagram are contained in each listing published in accordance with paragraph (b) of this standard. The listing shall be in one of the following forms:

(a) Listed by manufacturer name or brand name in a document furnished to dealers of the manufacturer’s tires, to any person upon request, and in duplicate to: Docket Section, National Highway Traffic Safety Administration, 400 Seventh Street SW, Washington, DC 20590; or
(b) Contained in publications, current at the date of manufacture of the tire or any later date, of at least one of the following organizations:
The Tire and Rim Association
The European Tyre and Rim Technical Organisation
Japan Automobile Tire Manufacturers’ Association
Deutsche Industrie Norm
British Standards Institution
Scandinavian Tire and Rim Organization
The Tyre and Rim Association of Australia

S5.2 Information contained in a publication specified in S5.1(b) which lists general categories of tires and rims by size designation, type of construction, and/or intended use, shall be considered to be manufacturer’s information pursuant to S5.1 for the listed tires, unless the publication itself or specific information provided according to S5.1(a) indicates otherwise.

S6. Requirements. Each tire shall be capable of meeting any of the applicable requirements set forth below, when mounted on a model rim assembly corresponding to any rim designated by
§571.119 49 CFR Ch. V (10–1–08 Edition)

the tire manufacturer for use with the tire in accordance with S5. However, a particular tire need not meet further requirements after having been subjected to and met the endurance test (S6.1), strength test (S6.2), or high speed performance test (S6.3).

S6.1 Endurance.
S6.1.1 Prior to testing in accordance with the procedures of S7.2, a tire shall exhibit no visual evidence of tread, sidewall, ply, cord, innerliner, or bead separation, chunking, broken cords, cracking, or open splices.

S6.1.2 When tested in accordance with the procedures of S7.2:
(a) There shall be no visual evidence of tread, sidewall, ply, cord, innerliner, or bead separation, chunking, broken cords, cracking, or open splices.
(b) The tire pressure at the end of the test shall be not less than the initial pressure specified in S7.2(a).

S6.2 Strength. When tested in accordance with the procedures of S7.3 a tire’s average breaking energy value shall be not less than the value specified in Table II for that tire’s size and load range.

S6.3 High speed performance. When tested in accordance with the procedures of S7.3 a tire’s average breaking energy value shall be not less than the value specified in Table II for that tire’s size and load range.

S6.4 Treadwear indicators. Except as specified in this paragraph, each tire shall have at least six treadwear indicators spaced approximately equally around the circumference of the tire that enable a person inspecting the tire to determine visually whether the tire has worn to a tread depth of 1.6 mm (one-sixteenths of an inch). Tires with a rim diameter code of 12 or smaller shall have at least three such treadwear indicators. Motorcycle tires shall have at least three such indicators which permit visual determination that the tire has worn to a tread depth of 0.8 mm (one-thirty-second of an inch).

S6.5 Tire markings. Except as specified in this paragraph, each tire shall be marked on each sidewall with the information specified in paragraphs (a) through (j) of this section. The markings shall be placed between the maximum section width (exclusive of sidewall decorations or curb ribs) and the bead on at least one sidewall, unless the maximum section width of the tire is located in an area which is not more than one-fourth of the distance from the bead to the shoulder of the tire. If the maximum section width falls within that area, the markings shall appear between the bead and a point one-half the distance from the bead to the shoulder of the tire, on at least one sidewall. The markings shall be in letters and numerals not less than 2 mm (0.078 inch) high and raised above or sunk below the tire surface not less than 0.4 mm (0.015 inch), except that the marking depth shall be not less than 0.25mm (0.010 inch) in the case of motorcycle tires. The tire identification and the DOT symbol labeling shall comply with part 574 of this chapter. Markings may appear on only one sidewall and the entire sidewall area may be used in the case of motorcycle tires and recreational, boat, baggage, and special trailer tires.

(a) The symbol DOT, which shall constitute a certification that the tire conforms to applicable Federal motor vehicle safety standards. This symbol may be marked on only one sidewall.
(b) The tire identification number required by part 574 of this chapter. This number may be marked on only one sidewall.
(c) The tire size designation as listed in the documents and publications designated in S5.1.
(d) The maximum load rating and corresponding inflation pressure of the tire, shown as follows:

(Mark on tires rated for single and dual load): Max load single ___ kg (___ lb) at ___ kPa (___ psi) cold. Max load dual ___ kg (___ lb) at ___ kPa (___ psi) cold.

(Mark on tires rated only for single load): Max load ___ kg (___ lb) at ___ kPa (___ psi) cold.
(e) The speed restriction of the tire, if 90 km/h (55 mph) or less, shown as follows:
Max speed ___ km/h (___ mph).
(f) The actual number of plies and the composition of the ply cord material in the sidewall and, if different, in the tread area;
§ 571.119

(g) The words "tubeless" or "tube type" as applicable.

(h) The word "regroovable" if the tire is designed for regrooving.

(i) The word "radial" if a radial tire.

(j) The letter designating the tire load range.

S6.6 Maximum load rating. If the maximum load rating for a particular tire size is shown in one or more of the publications described in S5.1(b), each tire of that size designation shall have a maximum load rating that is not less than the published maximum load rating, or if there are differing published ratings for the same tire size designation, not less than the lowest published maximum load rating for the size designation.

S7. Test procedures.

S7.1 General conditions.

S7.1.1 The tests are performed using an appropriate new tube, tube valve and flap assembly (as required) that allows no loss of air for testing of tube-type tires under S7.2, S7.3, and S7.4, and tubeless tires under S7.3.

S7.1.2 The tire must be capable of meeting the requirements of S7.2 and S7.4 when conditioned to a temperature of 35 °C (95 °F) for 3 hours before the test is conducted, and with an ambient temperature maintained at 35 °C (95 °F) during all phases of testing. The tire must be capable of meeting the requirements of S7.3 when conditioned at a temperature of 21 °C (70 °F) for 3 hours before the test is conducted.

S7.2 Endurance. (a) Mount the tire on a model rim assembly and inflate it to the inflation pressure corresponding to the maximum load rating marked on the tire. Use a single maximum load value when the tire is marked with both single and dual maximum load.

(b) After conditioning the tire-rim assembly in accordance with S7.1.2, adjust the tire pressure to that specified in (a) immediately before mounting the tire rim assembly.

(c) Mount the tire-rim assembly on an axle and press it against a flat-faced steel test wheel that is 1708 mm (67.23 inches) in diameter and at least as wide as the tread of the tire.

(d) Apply the test load and rotate the test wheel as indicated in Table III for the type of tire tested conducting each successive phase of the test without interruption.

(e) Immediately after running the tire the required time, measure the tire inflation pressure. Remove the tire from the model rim assembly, and inspect the tire.

S7.3 Strength. (a) Mount the tire on a model rim assembly and inflate it to the pressure corresponding to the maximum load, or maximum dual load where there is both a single and dual load marked on the tire. If the tire is tubeless, a tube may be inserted to prevent loss of air during the test in the event of puncture.

(b) After conditioning the tire-rim assembly in accordance with S7.1.2, adjust the tire pressure to that specified in (a).

(c) Force a cylindrical steel plunger, with a hemispherical end and of the diameter specified in Table I for the tire size, perpendicularly into a raised tread element as near as possible to the centerline of the tread, at a rate of 50 mm (2 inches) per minute, until the tire breaks or the plunger is stopped by the rim.

(d) Record the force and the distance of penetration just before the tire breaks, or if it fails to break, just before the plunger is stopped by the rim.

(e) Repeat the plunger application at 72° intervals around the circumference of the tire, until five measurements are made. However, in the case of tires of 12 inch rim diameter code or smaller, repeat the plunger application at 120° intervals around the circumference of the tire, until three measurements are made.

(f) Compute the breaking energy for each test point by one of the two following formulas:

(1) \[ W = \left( \frac{F \times P}{2} \right) \times 10^{-3} \] (joules)

Where:

\[ W = \text{Breaking energy (in joules)} \] (kJ)

\[ F = \text{Force in newtons (N)} \]

\[ P = \text{Penetration in millimeters (mm)} \], or;

(2) \[ W = (FP/2) \]

Where:

\[ W = \text{Breaking energy in inch-pounds,} \]

\[ F = \text{Force in pounds,} \]

\[ P = \text{Penetration in inches.} \]

(g) Determine the average breaking energy value for the tire by computing...
§ 571.119

the average of the values obtained in accordance with paragraph (f).

S7.4 High speed performance. (a) Perform steps (a) through (c) of S7.2.

(b) Apply a force of 88 percent of the maximum load rating marked on the tire (use single maximum load value when the tire is marked with both single and dual maximum loads), and rotate the test wheel at 250 rpm for 2 hours.

(c) Remove the load, allow the tire to cool to 35 °C (95 °F), and then adjust the pressure to that marked on the tire for single tire use.

(d) Reapply the same load, and without interruption or readjustment of inflation pressure, rotate the test wheel at 375 rpm for 30 minutes, then at 400 rpm for 30 minutes, and then at 425 rpm for 30 minutes.

(e) Immediately after running the tire the required time, measure the tire inflation pressure. Remove the tire from the model rim assembly, and inspect the tire.

§ 571.120 Tire selection and rims and motor home/recreation vehicle trailer load carrying capacity information for motor vehicles with a GVWR of more than 4,536 kilograms (10,000 pounds).

S1. Scope. This standard specifies tire and rim selection requirements, rim marking requirements and motor home/recreation vehicle trailer load carrying capacity information.

S2. Purpose. The purpose of this standard is to provide safe operational performance by ensuring that vehicles to which it applies are equipped with tires of adequate size and load rating and with rims of appropriate size and type designation, and by ensuring that consumers are informed of motor home/recreation vehicle trailer load carrying capacity.

S3. Application. This standard applies to motor vehicles with a gross vehicle weight rating (GVWR) of more than 4,536 kilograms (10,000 pounds and motorcycles, to rims for use on those vehicles, and to non-pneumatic spare tire assemblies for use on those vehicles.

S4. Definitions. All terms defined in the Act and the rules and standards issued under its authority are used as defined therein.

- **Rim base** means the portion of a rim remaining after removal of all split or continuous rim flanges, side rings, and locking rings that can be detached from the rim.

- **Rim size designation** means rim diameter and width.

- **Rim diameter** means nominal diameter of the bead seat.

- **Rim width** means nominal distance between rim flanges.

- **Rim type designation** means the industry or manufacturer’s designation for a rim by style or code.

- **Weather side** means the surface area of the rim not covered by the inflated tire.

S5. Requirements.

S5.1 **Tire and rim selection.**

S5.1.1 Except as specified in S5.1.3, each vehicle equipped with pneumatic tires for highway service shall be equipped with tires that meet the requirements of §571.109, §571.119 or §571.139, and rims that are listed by the manufacturer of the tires as suitable for use with those tires, in accordance with S4.4 of §571.109 or S5.1 of §571.119, as applicable, except that vehicles may be equipped with a non-pneumatic spare tire assembly that meets the requirements of §571.129, New non-pneumatic tires for passenger cars, and S8 of this standard. Vehicles equipped with such an assembly shall meet the requirements of S5.3.3, S7, and S9 of this standard.

§ 571.120

S5.1.2 Except in the case of a vehicle which has a speed attainable in 3.2 kilometers of 80 kilometers per hour or less, the sum of the maximum load ratings of the tires fitted to an axle shall be not less than the gross axle weight rating (GAWR) of the axle system as specified on the vehicle’s certification label required by 49 CFR part 567. Except in the case of a vehicle which has a speed attainable in 2 miles of 50 mph or less, the sum of the maximum load ratings of the tires fitted to an axle shall be not less than the gross axle weight rating (GAWR) of the axle system as specified on the vehicle’s certification label required by 49 CFR part 567. If the certification label shows more than one GAWR for the axle system, the sum shall be not less than the GAWR corresponding to the size designation of the tires fitted to the axle. If the size designation of the tires fitted to the axle does not appear on the certification label, the sum shall be not less than the lowest GAWR appearing on the label. When a passenger car tire is installed on a multipurpose passenger vehicle, truck, bus, or trailer, the tire’s load rating shall be reduced by dividing by 1.10 before calculating the sum, i.e., the sum of the load ratings of the tires on each axle, when the tires’ load carrying capacity at the recommended tire cold inflation pressure is reduced by dividing by 1.10, must be appropriate for the GAWR.

S5.1.3 In place of tires that meet the requirements of Standard No. 119, a truck, bus, or trailer may at the request of a purchaser be equipped at the place of manufacture of the vehicle with retreaded or used tires owned or leased by the purchaser, if the sum of the maximum load ratings meets the requirements of S5.1.2. Used tires employed under this provision must have been originally manufactured to comply with Standard No. 119, as evidenced by the DOT symbol.

S5.2 Rim marking. Each rim or, at the option of the manufacturer in the case of a single-piece wheel, wheel disc shall be marked with the information listed in paragraphs (a) through (e) of this paragraph, in lettering not less than 3 millimeters high, impressed to a depth of at least 0.125 millimeters. The information listed in paragraphs (a) through (c) of this paragraph shall appear on the weather side. In the case of rims of multi-piece construction, the information listed in paragraphs (a) through (e) of this paragraph shall appear on the rim base and the information listed in paragraphs (b) and (d) of this paragraph shall also appear on each other part of the rim.

(a) A designation which indicates the source of the rim’s published nominal dimensions, as follows:

(1) “T” indicates The Tire and Rim Association.

(2) “E” indicates The European Tyre and Rim Technical Organisation.

(3) “J” indicates Japan Automobile Tire Manufacturers’ Association, Inc.

(4) “D” indicates Deutsche Industrie Norm.

(5) “B” indicates British Standards Institution.

(6) “S” indicates Scandinavian Tire and Rim Organization.

(7) “A” indicates The Tyre and Rim Association of Australia.

(8) “N” indicates an independent listing pursuant to §4.4.1(a) of Standard No. 109 or §5.1(a) of Standard No. 119.

(b) The rim size designation, and in case of multi-piece rims, the rim type designation. For example: 20×5.50, or 20×5.5.

(c) The symbol DOT, constituting a certification by the manufacturer of the rim that the rim complies with all applicable motor vehicle safety standards.

(d) A designation that identifies the manufacturer of the rim by name, trademark, or symbol.

(e) The month, day and year or the month and year of manufacture, expressed either numerically or by use of a symbol, at the option of the manufacturer. For example:

“September 4, 1976” may be expressed numerically as: 90476, 904, or 76 904

“September 1976” may be expressed as: 976, 9, or 76 9

(1) Any manufacturer that elects to express the date of manufacture by means of a symbol shall notify NHTSA
§ 571.120

in writing of the full names and addresses of all manufacturers and brand name owners utilizing that symbol and the name and address of the trademark owner of that symbol, if any. The notification shall describe in narrative form and in detail how the month, day, and year or the month and year are depicted by the symbol. Such description shall include an actual size graphic depiction of the symbol, showing and/or explaining the interrelationship of the component parts of the symbol as they will appear on the rim or single piece wheel disc, including dimensional specifications, and where the symbol will be located on the rim or single piece wheel disc. The notification shall be received by NHTSA at least 60 calendar days prior to first use of the symbol. The notification shall be mailed to the Office of Vehicle Safety Compliance, National Highway Traffic Safety Administration, 400 Seventh Street SW., Washington, DC 20590. All information provided to NHTSA under this paragraph will be placed in the public docket.

(2) Each manufacturer of wheels shall provide an explanation of its date of manufacture symbol to any person upon request.

S5.3 Each vehicle shall show the information specified in S5.3.1 and S5.3.2 and, in the case of a vehicle equipped with a non-pneumatic spare tire, the information specified in S5.3.3, in the English language, lettered in block capitals and numerals not less than 2.4 millimeters high and in the format set forth following this paragraph. This information shall appear either—

(a) After each GAWR listed on the certification label required by §567.4 or §567.5 of this chapter; or at the option of the manufacturer.

(b) On the tire information label affixed to the vehicle in the manner, location, and form described in §567.4 (b) through (f) of this chapter as appropriate of each GVWR–GAWR combination listed on the certification label.

S5.3.1 Tires. The size designation (not necessarily for the tires on the vehicle) and the recommended cold inflation pressure for those tires such that the sum of the load ratings of the tires on each axle (when the tires’ load carrying capacity at the specified pressure is reduced by dividing by 1.10, in the case of a tire subject to FMVSS No. 109) is appropriate for the GAWR as calculated in accordance with S5.1.2.

S5.3.2. Rims. The size designation and, if applicable, the type designation of Rims (not necessarily those on the vehicle) appropriate for those tires.

TRUCK EXAMPLE—SUITABLE TIRE-RIM CHOICE

GVWR: 7,840 KG (17,289 LB)
GAWR: FRONT—2,850 KG (6,280 LB) WITH 7.50–20(D) TIRES, 20×6.00 RIMS AT 520 KPA (75 PSI) COLD SINGLE
GAWR: REAR—4,990 KG (11,000 LB) WITH 7.50–20(D) TIRES, 20×6.00 RIMS, AT 450 KPA (65 PSI) COLD DUAL

GVWR: 13,280 KG (29,279 LB)
GAWR: FRONT—4,826 KG (10,640 LB) WITH 10.00–20(F) TIRES, 20×7.50 RIMS, AT 620 KPA (90 PSI) COLD SINGLE
GAWR: REAR—8,454 KG (18,639 LB) WITH 10.00–20(F) TIRES, 20×7.50 RIMS, AT 550 KPA (80 PSI) COLD DUAL

S5.3.3 The non-pneumatic tire identification code, with which that assembly is labeled pursuant to S4.3(a) of §571.129.

S6. Load Limits for Non-Pneumatic Spare Tires. The highest vehicle maximum load on the tire for the vehicle shall not be greater than the load rating for the non-pneumatic spare tire.

S7 Labeling Requirements for Non-Pneumatic Spare Tires or Tire Assemblies. Each non-pneumatic tire or, in the case of a non-pneumatic tire assembly in which the non-pneumatic tire is an integral part of the assembly, each non-pneumatic tire assembly shall include, in letters or numerals not less than 4 millimeters high, the information specified in paragraphs S7 (a) and (b). The information shall be permanently molded, stamped, or otherwise permanently marked into or onto the non-pneumatic tire or non-pneumatic tire assembly, or shall appear on a label that is permanently attached to the tire or tire assembly. If a label is used, it shall be subsurface printed, made of material that is resistant to fade, heat, moisture and abrasion, and attached in such a manner that it cannot be removed without destroying or defacing the label on the non-pneumatic tire or tire assembly. The information specified in paragraphs S7 (a) and (b) shall
appear on both sides of the non-pneumatic tire or tire assembly, except, in the case of a non-pneumatic tire assembly which has a particular side that must always face outward when mounted on a vehicle, in which case the information specified in paragraphs S7 (a) and (b) shall only be required on the outward facing side. The information shall be positioned on the tire or tire assembly such that it is not placed on the tread or the outermost edge of the tire and is not obstructed by any portion of any non-pneumatic rim or wheel center member designated for use with that tire in this standard or in Standard No. 129.

(a) FOR TEMPORARY USE ONLY; and

(b) MAXIMUM 80 KM/H (50 M.P.H.).

S8. Requirements for Vehicles Equipped with Non-Pneumatic Spare Tire Assemblies

S8.1 Vehicle Placarding Requirements. A placard, permanently affixed to the inside of the spare tire stowage area or equally accessible location adjacent to the non-pneumatic spare tire assembly, shall display the information set forth in S7 in block capitals and numerals not less than 6 millimeters high preceded by the words “IMPORTANT—USE OF SPARE TIRE” in letters not less than 9 millimeters high.

S8.2 Supplementary Information. The owner’s manual of the vehicle shall contain, in writing in the English language and in not less than 10 point type, the following information under the heading “IMPORTANT—USE OF SPARE TIRE”:

(a) A statement indicating the information related to appropriate use for the non-pneumatic spare tire including at a minimum the information set forth in S8 (a) and (b) and either the information set forth in S5.3.6 or a statement that the information set forth in S5.3.6 is located on the vehicle placard and on the non-pneumatic tire;

(b) An instruction to drive carefully when the non-pneumatic spare tire is in use, and to install the proper pneumatic tire and rim at the first reasonable opportunity; and

(c) A statement that operation of the vehicle is not recommended with more than one non-pneumatic spare tire in use at the same time.

S9 Non-Pneumatic Rims and Wheel Center Members

S9.1 Non-Pneumatic Rim Requirements. Each non-pneumatic rim that is part of a separable non-pneumatic spare tire assembly shall be constructed to the dimensions of a non-pneumatic rim that is listed pursuant to §5.4 of §571.129 for use with the non-pneumatic tire, designated by its non-pneumatic tire identification code, with which the vehicle is equipped.

S9.2 Wheel Center Member Requirements. Each wheel center member that is part of a separable non-pneumatic spare tire assembly shall be constructed to the dimensions of a wheel center member that is listed pursuant to §5.4 of §571.129 for use with the non-pneumatic tire, designated by its non-pneumatic tire identification code, with which the vehicle is equipped.

S10. Each motor home and recreation vehicle (RV) trailer must meet the applicable requirements in S10.

S10.1 On motor homes, the sum of the gross axle weight ratings (GAWR) of all axles on the vehicle must not be less than the gross vehicle weight rating (GVWR).

S10.2 On RV trailers, the sum of the GAWRs of all axles on the vehicle plus the vehicle manufacturer’s recommended tongue weight must not be less than the GVWR. If tongue weight is specified as a range, the minimum value must be used.

S10.3 The tires on each motor home and RV trailer at first retail sale must be the same size as the tire size on the labeling required by S5.3.

S10.4 Each motor home and RV trailer single stage or final stage manufacturer must affix either a motor home occupant and cargo carrying capacity (OCCC) label (Figure 1) or a RV trailer cargo carrying capacity (CCC) label (Figure 2) to its vehicles that meets the following criteria:

S10.4.1 The RV load carrying capacity labels (Figures 1 and 2) must be legible, visible, moisture resistant, presented in the English language, have a minimum print size of 2.4 millimeters (3/32 inches) high and be printed in black print on a yellow background.

S10.4.2 The weight value for load carrying capacity on the RV load carrying capacity labels (Figures 1 and 2)
must be displayed to the nearest kilogram with conversion to the nearest pound and must be such that the vehicle’s weight does not exceed its GVWR when loaded with the stated load carrying capacity. The UVW and the GVWR used to determine the RV’s load carrying capacity must reflect the weights and design of the motor home or RV trailer as configured for delivery to the dealer/service facility. If applicable, the weight of full propane tanks must be included in the RV’s UVW and the weight of on-board potable water must be treated as cargo.

S10.4.3 The RV load carrying capacity labels (Figures 1 and 2) must be:

(a) Permanently affixed and must be visibly located on the interior of the forward-most exterior passenger door on the right side of the vehicle; or

(b) If a permanent RV load carrying capacity label (Figure 1 or 2) is affixed in the location specified at S5.3(b), a temporary version of the RV load carrying capacity label (Figure 1 or 2) may be visibly located on the interior of the forward-most exterior passenger door on the right side of the vehicle.

S10.4.4 Permanent and temporary motor home OCCC labels must contain the following information in accordance with Figure 1:

(a) The statement: “MOTOR HOME OCCUPANT AND CARGO CARRYING CAPACITY” in block letters.

(b) The Vehicle Identification Number (VIN).

(c) The statement “THE COMBINED WEIGHT OF OCCUPANTS AND CARGO SHOULD NEVER EXCEED: XXX kg or XXX lbs” in block letters with appropriate values included.

(d) The statement: “Safety belt equipped seating capacity: XXX” with the appropriate value included. This is the total number of safety belt equipped seating positions.

(e) The statement: “CAUTION: A full load of water equals XXX kg or XXX lbs of cargo @ 1 kg/L (8.3 lb/gal) and the tongue weight of a towed trailer counts as cargo” with appropriate values included.

S10.4.5 Permanent and temporary RV trailer CCC labels must contain the following information in accordance with Figure 2:

(a) The statement: “RECREATION VEHICLE TRAILER CARGO CARRYING CAPACITY” in block letters.

(b) The Vehicle Identification Number (VIN).

(c) The statement: “THE WEIGHT OF CARGO SHOULD NEVER EXCEED: XXX kg or XXX lbs” in block letters with appropriate values included.

(d) The statement: “CAUTION: A full load of water equals XXX kg or XXX lbs of cargo @ 1 kg/L (8.3 lb/gal)” with appropriate values included.

S10.5 Weight added to motor homes and RV trailers between final vehicle certification and first retail sale of the vehicle.

S10.5.1 If weight exceeding 45.4 kg (100 pounds) is added to a motor home or RV trailer between final vehicle certification and first retail sale of the vehicle, the load carrying capacity values on the RV load carrying capacity labels (Figures 1 and 2) required by S10.4 must be corrected using one or a combination of the following methods:

(a) Permanently affix the load carrying capacity modification label (Figure 3) which displays the amount the load carrying capacity is reduced to the nearest kilogram with conversion to the nearest pound, within 25 millimeters of the original, permanent RV load carrying capacity label (Figure 1 or 2). The load carrying capacity modification label must be legible, visible, permanent, moisture resistant, presented in the English language, have a minimum print size of 2.4 millimeters (3/32 inches) high and be printed in black print on a yellow background. If the manufacturer selects S10.4.3(b), apply a temporary version of the load carrying capacity modification label (Figure 3) within 25 millimeters of the original, permanent RV load carrying capacity label (Figure 1 or 2). The load carrying capacity modification label must be legible, visible, permanent, moisture resistant, presented in the English language, have a minimum print size of 2.4 millimeters (3/32 inches) high and be printed in black print on a yellow background. If the manufacturer selects S10.4.3(b), apply a temporary version of the load carrying capacity modification label (Figure 3) within 25 millimeters of the original, permanent RV load carrying capacity label (Figure 1 or 2) on the interior of the forward-most exterior passenger door on the right side of the vehicle. Both temporary and permanent versions of the load carrying capacity modification label (Figure 3) may be printed without values and values may be legibly applied to the label with a black, fine point, indelible marker. The label must contain the statements “CAUTION—LOAD CARRYING CAPACITY REDUCED” in block letters and “Modifications to this vehicle have
reduced the original load carrying capacity by XXX kg or XXX lbs’ in accordance with Figure 3 with appropriate values in place of XXX. If two load carrying capacity modification labels are required (one permanent and one temporary), the weight values on each must agree, or

(b) Modify the original permanent RV load carrying capacity label (Figure 1 or 2) with correct load carrying capacity weight values. If the manufacturer selects S10.4.3(b), the temporary RV load carrying capacity label (Figure 1 or 2) must also be modified with correct load carrying capacity weight values. Modification of labels requires a machine printed overlay with printed corrected values or blanks for corrected values that may be entered with a black, fine-point, indelible marker. Crossing out old values and entering corrected values on the original label is not permissible, or

(c) Replace the original, permanent RV load carrying capacity label (Figure 1 or 2) with the same label containing correct load carrying capacity weight values. If the manufacturer selects S10.4.3(b), the temporary RV load carrying capacity label (Figure 1 or 2) must also be replaced with the same label containing correct load carrying capacity weight values.

S10.5.2 Corrected load carrying capacity weight values or the weight amount the load carrying capacity is reduced, must reflect the total weight added between final vehicle certification and first retail sale and must be accurate within one percent of the actual added weight. No re-labeling is required if the weight of the vehicle is reduced between final vehicle certification and the first retail sale.

---

**MOTOR HOME OCCUPANT AND CARGO CARRYING CAPACITY**

VIN: #0000000000

THE COMBINED WEIGHT OF OCCUPANTS AND CARGO SHOULD NEVER EXCEED:

XXX kg or XXX lbs

Safety belt equipped seating capacity: XXX

CAUTION:

A full load of water equals XXX kg or XXX lbs of cargo @ 1 kg/L (8.3 lb/gal) and the tongue weight of a towing trailer counts as cargo

Figure 1 - Motor Home Occupant and Cargo Carrying Capacity Label

**RECREATION VEHICLE TRAILER CARGO CARRYING CAPACITY**

VIN: #0000000000

THE WEIGHT OF CARGO SHOULD NEVER EXCEED:

XXX kg or XXX lbs

CAUTION:

A full load of water equals XXX kg or XXX lbs of cargo @ 1 kg/L (8.3 lb/gal)

Figure 2 - RV Trailer Cargo Carrying Capacity Label

**CAUTION: LOAD CARRYING CAPACITY REDUCED**

Modifications to this vehicle have reduced the original load carrying capacity by __________ kg or __________ lbs

§ 571.121  Air brake systems.

S1. Scope. This standard establishes performance and equipment requirements for braking systems on vehicles equipped with air brake systems.

S2. Purpose. The purpose of this standard is to insure safe braking performance under normal and emergency conditions.

S3. Application. This standard applies to trucks, buses, and trailers equipped with air brake systems. However, it does not apply to:

(a) Any trailer that has a width of more than 102.36 inches with extendable equipment in the fully retracted position and is equipped with two short track axles in a line across the width of the trailer.
(b) Any vehicle equipped with an axle that has a gross axle weight rating (GAWR) of 29,000 pounds or more;
(c) Any truck or bus that has a speed attainable in 2 miles of not more than 33 mph;
(d) Any truck that has a speed attainable in 2 miles of not more than 45 mph, an unloaded vehicle weight that is not less than 95 percent of its gross vehicle weight rating (GVWR), and no capacity to carry occupants other than the driver and operating crew;
(e) Any trailer that has a GVWR of more than 120,000 pounds and whose body conforms to that described in the definition of heavy hauler trailer set forth in §4;
(f) Any trailer that has an unloaded vehicle weight which is not less than 95 percent of its GVWR;
(g) Any load divider dolly.

S4. Definitions.

Agricultural commodity trailer means a trailer that is designed to transport bulk agricultural commodities in off-road harvesting sites and to a processing plant or storage location, as evidenced by skeletal construction that accommodates harvest containers, a maximum length of 28 feet, and an arrangement of air control lines and reservoirs that minimizes damage in field operations.

Air brake system means a system that uses air as a medium for transmitting pressure or force from the driver control to the service brake, including an air-over-hydraulic brake subsystem, but does not include a system that uses compressed air or vacuum only to assist the driver in applying muscular force to hydraulic or mechanical components.

Air-over-hydraulic brake subsystem means a subsystem of the air brake system that uses compressed air to transmit a force from the driver control to a hydraulic brake system to actuate the service brakes.

Antilock brake system or ABS means a portion of a service brake system that automatically controls the degree of rotational wheel slip during braking by:

(1) Sensing the rate of angular rotation of the wheels;
(2) Transmitting signals regarding the rate of wheel angular rotation to one or more controlling devices which interpret those signals and generate responsive controlling output signals; and
(3) Transmitting those controlling signals to one or more modulators which adjust brake actuating forces in response to those signals.

Auto transporter means a truck and a trailer designed for use in combination to transport motor vehicles, in that the towing vehicle is designed to carry cargo at a location other than the fifth wheel and to load this cargo only by means of the towed vehicle.

Common diaphragm means a single brake chamber diaphragm which is a component of the parking, emergency, and service brake systems.

Container chassis trailer means a semitrailer of skeleton construction limited to a bottom frame, one or more axles, specially built and fitted with locking devices for the transport of intermodal shipping containers, so that
when the chassis and container are assembled, the units serve the same function as an over the road trailer.  

Directly controlled wheel means a wheel for which the degree of rotational wheel slip is sensed, either at that wheel or on the axle shaft for that wheel and corresponding signals are transmitted to one or more modulators that adjust the brake actuating forces at that wheel. Each modulator may also adjust the brake actuating forces at other wheels that are on the same axle or in the same axle set in response to the same signal or signals.

Effective projected luminous lens area means that area of the projection on a plane perpendicular to the lamp axis of that portion of the light-emitting surface that directs light to the photometric test pattern, and does not include mounting hole bosses, reflex reflector area, beads or rims that may glow or produce small areas of increased intensity as a result of uncontrolled light from small areas (1/2 degree radius around the test point).

Full-treadle brake application means a brake application in which the treadle valve pressure in any of the valve's output circuits reaches 85 pounds per square inch (psi) within 0.2 seconds after the application is initiated, or in which maximum treadle travel is achieved within 0.2 seconds after the application is initiated.

Heavy hauler trailer means a trailer which has one or more of the following characteristics, but which is not a container chassis trailer:

(1) Its brake lines are designed to adapt to separation or extension of the vehicle frame; or

(2) Its body consists only of a platform whose primary cargo-carrying surface is not more than 40 inches above the ground in an unloaded condition, except that it may include sides that are designed to be easily removable and a permanent "front end structure" as that term is used in §393.106 of this title.

Independently controlled wheel means a directly controlled wheel for which the modulator does not adjust the brake actuating forces at any other wheel on the same axle.

Indirectly controlled wheel means a wheel at which the degree of rotational wheel slip is not sensed, but at which the modulator of an antilock braking system adjusts its brake actuating forces in response to signals from one or more sensed wheel(s).

Initial brake temperature means the average temperature of the service brakes on the hottest axle of the vehicle 0.2 mile before any brake application in the case of road tests, or 18 seconds before any brake application in the case of dynamometer testing.

Intermodal shipping container means a reusable, transportable enclosure that is especially designed with integral locking devices for securing the container to the trailer to facilitate the efficient and bulk shipping and transfer of goods by, or between various modes of transport, such as highway, rail, sea and air.

Load divider dolly means a trailer composed of a trailer chassis and one or more axles, with no solid bed, body, or container attached, and which is designed exclusively to support a portion of the load on a trailer or truck excluded from all the requirements of this standard.

Maximum drive-through speed means the highest possible constant speed at which the vehicle can be driven through 200 feet of a 500-foot radius curve arc without leaving the 12-foot lane.

Maximum treadle travel means the distance that the treadle moves from its position when no force is applied to its position when the treadle reaches a full stop.

Peak friction coefficient or PFC means the ratio of the maximum value of braking test wheel longitudinal force to the simultaneous vertical force occurring prior to wheel lockup, as the braking torque is progressively increased.

Pulpwood trailer means a trailer that is designed exclusively for harvesting logs or pulpwood and constructed with a skeletal frame with no means for attachment of a solid bed, body, or container, and with an arrangement of air control lines and reservoirs designed to minimize damage in off-road operations.

Tandem axle means a group or set of two or more axles placed in a close arrangement, one behind the other, with
§ 571.121

the centerlines of adjacent axles not more than 72 inches apart.

Straddle trailer means a trailer that is designed to transport bulk agricultural commodities from the harvesting location as evidenced by a framework that is driven over the cargo and lifting arms that suspend the cargo for transit.

Wheel lockup means 100 percent wheel slip.

S5. Requirements. Each vehicle shall meet the following requirements under the conditions specified in S6.

S5.1 Required equipment for trucks and buses. Each truck and bus shall have the following equipment:

S5.1.1 Air compressor. An air compressor of sufficient capacity to increase air pressure in the supply and service reservoirs from 85 psi to 100 psi when the engine is operating at the vehicle manufacturer's maximum recommended r.p.m. within a time, in seconds, determined by the quotient (Actual reservoir capacity × 25)/Required reservoir capacity.

S5.1.1.1 Air compressor cut-in pressure. The air compressor governor cut-in pressure for each bus shall be 85 p.s.i. or greater. The air compressor governor cut-in pressure for each truck shall be 100 p.s.i. or greater.

S5.1.2 Reservoirs. One or more service reservoir systems, from which air is delivered to the brake chambers, and either an automatic condensate drain valve for each service reservoir or a supply reservoir between the service reservoir system and the source of air pressure.

S5.1.2.1 The combined volume of all service reservoirs and supply reservoirs shall be at least 12 times the combined volume of all service brake chambers. For each brake chamber type having a full stroke at least as great as the first number in Column 1 of Table V, but no more than the second number in Column 1 of Table V, the volume of each brake chamber for purposes of calculating the required combined service and supply reservoir volume shall be either that specified in Column 2 of Table V or the actual volume of the brake chamber at maximum travel of the brake piston or pushrod, whichever is lower. The volume of a brake chamber not listed in Table V is the volume of the brake chamber at maximum travel of the brake piston or pushrod. The reservoirs of the truck portion of an auto transporter need not meet this requirement for reservoir volume.

S5.1.2.2 Each reservoir shall be capable of withstanding an internal hydrostatic pressure of five times the compressor cutout pressure or 500 psi, whichever is greater, for 10 minutes.

S5.1.2.3 Each service reservoir system shall be protected against loss of air pressure due to failure or leakage in the system between the service reservoir and the source of air pressure, by check valves or equivalent devices whose proper functioning can be checked without disconnecting any air line or fitting.

S5.1.2.4 Each reservoir shall have a condensate drain valve that can be manually operated.

S5.1.3 Towing vehicle protection system. If the vehicle is intended to tow another vehicle equipped with air brakes, a system to protect the air pressure in the towing vehicle from the effects of a loss of air pressure in the towed vehicle.

S5.1.4 Pressure gauge. A pressure gauge in each service brake system, readily visible to a person seated in the normal driving position, that indicates the service reservoir system air pressure. The accuracy of the gauge shall be within plus or minus 7 percent of the compressor cut-out pressure.

S5.1.5 Warning signal. A signal, other than a pressure gauge, that gives a continuous warning to a person in the normal driving position when the ignition is in the “on” (“run”) position and the air pressure in the service reservoir system is below 60 psi. The signal shall be either visible within the driver’s forward field of view, or both audible and visible.

S5.1.6 Antilock brake system.

S5.1.6.1(a) Each single-unit vehicle manufactured on or after March 1, 1998, shall be equipped with an antilock brake system that directly controls the wheels of at least one front axle and the wheels of at least one rear axle of the vehicle. Wheels on other axles of the vehicle may be indirectly controlled by the antilock brake system.

(b) Each truck tractor manufactured on or after March 1, 1997, shall be
equipped with an antilock brake system that directly controls the wheels of at least one front axle and the wheels of at least one rear axle of the vehicle, with the wheels of at least one axle being independently controlled. Wheels on other axles of the vehicle may be indirectly controlled by the antilock brake system. A truck tractor shall have no more than three wheels controlled by one modulator.

§5.1.6.2 Antilock malfunction signal and circuit.
(a) Each truck tractor manufactured on or after March 1, 1997, and each single unit vehicle manufactured on or after March 1, 1998, shall be equipped with an indicator lamp, mounted in front of and in clear view of the driver, which is activated whenever there is a malfunction that affects the generation or transmission of response or control signals in the vehicle’s antilock brake system. The indicator lamp shall remain activated as long as such a malfunction exists, whenever the ignition (start) switch is in the “on” (“run”) position, whether or not the engine is running. The indicator lamp shall also be activated as a check of lamp function whenever the ignition is turned to the “on” (“run”) position. The indicator lamp shall be deactivated at the end of the check of lamp function unless there is a malfunction or a message about a malfunction that existed when the key switch was last turned to the “off” position.

(b) Each truck tractor manufactured on or after March 1, 2001, and each single unit vehicle manufactured on or after March 1, 2001, that is equipped to tow another air-braked vehicle shall be equipped with one or more electrical circuits that provide continuous power to the antilock system on each towed vehicle whenever the ignition (start) switch is in the “on” (“run”) position. Such a circuit shall be adequate to enable the antilock system on each towed vehicle to be fully operable.

§5.1.7 Service brake stop lamp switch.
A switch that lights the stop lamps when the service brake control is statisically depressed to a point that produces a pressure of 6 psi or less in the service brake chambers.

§5.1.8 Brake distribution and automatic adjustment.
(a) Brake adjuster. Wear of the service brakes shall be compensated for by means of a system of automatic adjustment. When inspected pursuant to §5.9, the adjustment of the service brakes shall be within the limits recommended by the vehicle manufacturer.

(b) Brake indicator. For each brake equipped with an external automatic
adjustment mechanism and having an exposed pushrod, the condition of service brake under-adjustment shall be displayed by a brake adjustment indicator that is discernible when viewed with 20/40 vision from a location adjacent to or underneath the vehicle, when inspected pursuant to §5.9.

§5.2 Required equipment for trailers. Each trailer shall have the following equipment:

§5.2.1 Reservoirs. One or more reservoirs to which the air is delivered from the towing vehicle.

§5.2.1.1 The total volume of each service reservoir shall be at least eight times the combined volume of all service brake chambers serviced by that reservoir. For each brake chamber type having a full stroke at least as great as the first number in Column 1 of Table V, but no more than the second number in column 1, the volume of each brake chamber for purposes of calculating the required total service reservoir volume shall be either the number specified in Column 2 of Table V or the actual volume of the brake chamber at maximum travel of the brake piston or pushrod, whichever is lower. The volume of a brake chamber not listed in Table V is the volume of the brake chamber at maximum travel of the brake piston or pushrod. The reservoirs on a heavy hauler trailer and the trailer portion of an auto transporter need not meet this requirement for reservoir volume.

§5.2.1.2 Each reservoir shall be capable of withstanding an internal hydrostatic pressure of 500 psi for 10 minutes.

§5.2.1.3 Each reservoir shall have a condensate drain valve that can be manually operated.

§5.2.1.4 Each service reservoir shall be protected against loss of air pressure due to failure or leakage in the system between the service reservoir and its source of air pressure by check valves or equivalent devices.

§5.2.2 Brake distribution and automatic adjustment. Each vehicle shall be equipped with a service brake system acting on all wheels.

(a) Brake adjuster. Wear of the service brakes shall be compensated for by means of a system of automatic adjustment. When inspected pursuant to §5.9, the adjustment of the service brakes shall be within the limits recommended by the vehicle manufacturer.

(b) Brake indicator. For each brake equipped with an external automatic adjustment mechanism and having an exposed pushrod, the condition of service brake under-adjustment shall be displayed by a brake adjustment indicator in a manner that is discernible when viewed with 20/40 vision from a location adjacent to or underneath the vehicle, when inspected pursuant to §5.9.

§5.2.3 Antilock brake system.

§5.2.3.1(a) Each semitrailer (including a trailer converter dolly) manufactured on or after March 1, 1998, shall be equipped with an antilock brake system that directly controls the wheels of at least one axle of the vehicle. Wheels on other axles of the vehicle may be indirectly controlled by the antilock brake system.

(b) Each full trailer manufactured on or after March 1, 1998, shall be equipped with an antilock brake system that directly controls the wheels of at least one front axle of the vehicle and at least one rear axle of the vehicle. Wheels on other axles of the vehicle may be indirectly controlled by the antilock brake system.

§5.2.3.2 Antilock malfunction signal. Each trailer (including a trailer converter dolly) manufactured on or after March 1, 2001, that is equipped with an antilock brake system shall be equipped with an electrical circuit that is capable of signaling a malfunction in the trailer’s antilock brake system, and shall have the means for connection of this antilock brake system malfunction signal circuit to the towing vehicle. The electrical circuit need not be separate or dedicated exclusively to this malfunction signaling function. The signal shall be present whenever there is a malfunction that affects the generation or transmission of response or control signals in the trailer’s antilock brake system. The signal shall remain present as long as the malfunction exists, whenever power is supplied to the antilock brake system. Each message about the existence of such a malfunction shall be stored in the antilock brake system whenever power is no longer supplied to the system, and the malfunction signal shall be.
automatically reactivated whenever power is again supplied to the trailer's antilock brake system. In addition, each trailer manufactured on or after March 1, 2001, that is designed to tow other air-brake equipped trailers shall be capable of transmitting a malfunction signal from the antilock brake systems of additional trailers it tows to the vehicle towing it.

§5.2.3.3 Antilock malfunction indicator

(a) In addition to the requirements of §5.2.3.2, each trailer and trailer converter dolly manufactured on or after March 1, 1998, and before March 1, 2009, shall be equipped with an external antilock malfunction indicator lamp that meets the requirements of §5.2.3.3 (b) through (d).

(b)(1) The lamp shall be designed to conform to the performance requirements of Society of Automotive Engineers (SAE) Recommended Practice J592 JUN92, or J592e, July 1972, Clearance, Side Marker, and Identification Lamps, for combination, clearance, and side marker lamps, which are marked with a “PC” or “P2” on the lens or housing, in accordance with SAE J759 Jan 95, Lighting Identification Code. SAE J592 June 92, SAE J592e July 1972, and SAE J759 January 1995, are incorporated by reference and thereby are made part of this standard. The Director of the Federal Register approved the material incorporated by reference in accordance with 5 U.S.C. 552(a) and 1 CFR part 51. Copies of the material may be inspected at NHTSA’s Docket Section, 400 Seventh Street, SW., room 5109, Washington, DC, or at the National Archives and Records Administration (NARA). For information on the availability of this material at NARA, call 202-741-6030, or go to: http://www.archives.gov/federal_register/code_of_federal_regulations/ibr_locations.html.

(2) The color of the lamp shall be yellow.

(3) The letters “ABS” shall be permanently molded, stamped, or otherwise marked or labeled in letters not less than 10 mm (0.4 inches) high on the lamp lens or its housing to identify the function of the lamp. Alternatively, the letters “ABS” may be painted on the trailer body or dolly or a plaque with the letters “ABS” may be affixed to the trailer body or converter dolly; the letters “ABS” shall be not less than 25 mm (1 inch) high. A portion of one of the letters in the alternative identification shall be not more than 150 mm (5.9 inches) from the edge of the lamp lens.

(c) Location requirements. (1) Each trailer that is not a trailer converter dolly shall be equipped with a lamp mounted on a permanent structure on the left side of the trailer as viewed from the rear, no closer than 150 mm (5.9 inches), and no farther than 600 mm (23.6 inches) from the red rear side marker lamp, when measured between the closest edge of the effective projected luminous lens area of each lamp. (2) Each trailer converter dolly shall be equipped with a lamp mounted on a permanent structure of the dolly so that the lamp is not less than 375 mm (14.8 inches) above the road surface when measured from the center of the lamp with the dolly at curb weight. When a person, standing 3 meters (9.8 feet) from the lamp, views the lamp from a perspective perpendicular to the vehicle’s centerline, no portion of the lamp shall be obscured by any structure on the dolly.

(d) The lamp shall be illuminated whenever power is supplied to the antilock brake system and there is a malfunction that affects the generation or transmission of response or control signals in the trailer’s antilock brake system. The lamp shall remain illuminated as long as such a malfunction exists and power is supplied to the antilock brake system. Each message about the existence of such a malfunction shall be stored in the antilock brake system whenever power is no longer supplied to the system. The lamp shall be automatically reactivated when power is again supplied to...
the trailer’s antilock brake system.
The lamp shall also be activated as a
check of lamp function whenever power
is first supplied to the antilock brake
system and the vehicle is stationary.
The lamp shall be deactivated at the
end of the check of lamp function, un-
less there is a malfunction or a mes-
sage about a malfunction that existed
when power was last supplied to the
antilock brake system.
S5.3 Service brakes—road tests. The
service brake system on each truck
tractor shall, under the conditions of
S6, meet the requirements of S5.3.1,
S5.3.3, S5.3.4, and S5.3.6, when tested
without adjustments other than those
specified in this standard. The service
brake system on each bus and truck
(other than a truck tractor) manufactured
before July 1, 2005 and each bus and truck
(other than a truck tractor) manufactured
in two or more stages shall, under the conditions of
S6, meet the requirements of S5.3.1,
S5.3.3, and S5.3.4 when tested without
adjustments other than those specified
in this standard. The service brake sys-
tem on each bus and truck (other than
a truck tractor) manufactured on or
after July 1, 2005, and each single unit ve-
hicle manufactured on or after March
1, 1998, shall meet the requirements of
S5.3.1, S5.3.3, and S5.3.4 when tested without
adjustments other than those specified
in this standard. The service brake sys-
tem on each bus and truck (other than
a truck tractor) manufactured on or
after July 1, 2005, and each single unit ve-
hicle manufactured on or after March
1, 1998, shall meet the requirements of
S5.3.1, S5.3.3, and S5.3.4 when tested without
adjustments other than those specified
in this standard. The service brake sys-
tem on each trailer shall, under the
conditions of S6, meet the require-
ments of S5.3, S5.3.3, S5.3.4, and S5.3.5 when tested without
adjustments other than those specified
in this standard. However, a heavy hauler trailer and the
truck and trailer portions of an auto
transporter need not meet the require-
ments of S5.3.
S5.3.1 Stopping distance—trucks and
buses. When stopped six times for each
combination of vehicle type, weight,
and speed specified in S5.3.1.1, in the
sequence specified in Table I, each truck
tractor manufactured on or after
March 1, 1997, and each single unit ve-
hicle manufactured on or after March
1, 1998, shall stop at least once in not
more than the distance specified in
Table II, measured from the point at
which movement of the service brake
control begins, without any part of the
vehicle leaving the roadway, and with
wheel lockup permitted only as fol-
lovs:
(a) At vehicle speeds above 20 mph,
any wheel on a nonsteerable axle other
than the two rearmost nonliftable,
nonsteerable axles may lock up, for
any duration. The wheels on the two
rearmost nonliftable, nonsteerable
axles may lock up according to
S5.3.1(b).
(b) At vehicle speeds above 20 mph,
one wheel on any axle or two wheels on
any tandem may lock up for any dura-
tion.
(c) At vehicle speeds above 20 mph,
any wheel not permitted to lock in
S5.3.1 (a) or (b) may lock up repeatedly,
with each lockup occurring for a dura-
tion of one second or less.
(d) At vehicle speeds of 20 mph or
less, any wheel may lock up for any du-
ration.
S5.3.1.1 Stop the vehicle from 60
mph on a surface with a peak friction
coefficient of 0.9 with the vehicle load-
ed as follows:
(a) Loaded to its GVWR so that the
load on each axle, measured at the tire-
ground interface, is most nearly pro-
portional to the axles’ respective
GAWRs, without exceeding the GAWR
of any axle.
(b) In the truck tractor only configu-
rations plus up to 500 lbs. or, at the
manufacturer’s option, at its unloaded
weight plus up to 500 lbs. (including
driver and instrumentation) and plus
not more than an additional 1,000 lbs.
for a roll bar structure on the vehicle,
and
(c) At its unloaded vehicle weight
(except for truck tractors) plus up to
500 lbs. (including driver and instru-
mentation) or, at the manufacturer’s
option, at its unloaded weight plus up to
500 lbs. (including driver and instru-
mentation) plus not more than an addi-
tional 1,000 lbs. for a roll bar structure
on the vehicle. If the speed attainable
in two miles is less than 60 mph, the
vehicle shall stop from a speed in Table
II that is four to eight mph less than
the speed attainable in two miles.
S5.3.2 [Reserved]
S5.3.3 Brake actuation time. Each service brake system shall meet the requirements of S5.3.3.1 (a) and (b).

S5.3.3.1(a) With an initial service reservoir system air pressure of 100 psi, the air pressure in each brake chamber shall, when measured from the first movement of the service brake control, reach 60 psi in not more than 0.45 second in the case of trucks and buses, 0.50 second in the case of trailers, other than trailer converter dollies, designed to tow another vehicle equipped with air brakes, 0.55 second in the case of trailer converter dollies, and 0.60 second in the case of trailers other than trailers designed to tow another vehicle equipped with air brakes. A vehicle designated to tow another vehicle equipped with air brakes shall meet the above actuation time requirement with a 50-cubic-inch test reservoir connected to the control line output coupling. A trailer, including a trailer converter dolly, shall meet the above actuation time requirement with its control line input coupling connected to the test rig shown in Figure 1.

(b) For vehicles designed to tow another vehicle equipped with air brakes, the pressure in the 50-cubic-inch test reservoir referred to in S5.3.3.1(a) shall, when measured from the first movement of the service brake control, fall to 5 psi in not more than 0.75 seconds in the case of trucks and buses, 1.10 seconds in the case of trailer converter dollies, and 1.00 seconds in the case of trailers other than trailer converter dollies.

S5.3.4 Brake release time. Each service brake system shall meet the requirements of S5.3.4.1 (a) and (b).

S5.3.4.1(a) With an initial service brake chamber air pressure of 95 psi, the air pressure in each brake chamber shall, when measured from the first movement of the service brake control, fall to 5 psi in not more than 0.55 second in the case of trucks and buses; 1.00 second in the case of trailers, other than trailer converter dollies, designed to tow another vehicle equipped with air brakes; 1.10 seconds in the case of trailer converter dollies; and 1.20 seconds in the case of trailers other than trailers designed to tow another vehicle equipped with air brakes. A vehicle designated to tow another vehicle equipped with air brakes shall meet the above release time requirement with a 50-cubic-inch test reservoir connected to the control line output coupling. A trailer, including a trailer converter dolly, shall meet the above release time requirement with its control line input coupling connected to the test rig shown in Figure 1.

(b) For vehicles designed to tow another vehicle equipped with air brakes, the pressure in the 50-cubic-inch test reservoir referred to in S5.3.4.1(a) shall, when measured from the first movement of the service brake control, fall to 5 psi in not more than 0.75 seconds in the case of trucks and buses, 1.10 seconds in the case of trailer converter dollies, and 1.00 seconds in the case of trailers other than trailer converter dollies.

S5.3.5 Control signal pressure differential—converter dollies and trailers designed to tow another vehicle equipped with air brakes.

(a) For a trailer designed to tow another vehicle equipped with air brakes, the pressure differential between the control line input coupling and a 50-cubic-inch test reservoir attached to the control line output coupling shall not exceed the values specified in S5.3.5(a) (1), (2), and (3) under the conditions specified in S5.3.5(b) (1) through (4):

(1) 1 psi at all input pressures equal to or greater than 5 psi, but not greater than 20 psi;
(2) 2 psi at all input pressures equal to or greater than 20 psi but not greater than 40 psi; and
(3) Not more than a 5-percent differential at any input pressure equal to or greater than 40 psi.

S5.3.5(b) The requirements in S5.3.5(a) shall be met—

(1) When the pressure at the input coupling is steady, increasing or decreasing;
(2) When air is applied to or released from the control line input coupling using the trailer test rig shown in Figure 1;
(3) With a fixed orifice consisting of a 0.0180 inch diameter hole (no. 77 drill bit) in a 0.032 inch thick disc installed...
in the control line between the trailer test rig coupling and the vehicle’s control line input coupling; and

(4) Operating the trailer test rig in the same manner and under the same conditions as it is operated during testing to measure brake actuation and release times, as specified in §5.3.3 and §5.3.4, except for the installation of the orifice in the control line to restrict airflow rate.

§5.3.6 Stability and control during braking—trucks and buses. When stopped four consecutive times for each combination of weight, speed, and road conditions specified in §5.3.6.1 and §5.3.6.2, each truck tractor shall stop at least three times within the 12-foot lane, without any part of the vehicle leaving the roadway. When stopped four consecutive times for each combination of weight, speed, and road conditions specified in §5.3.6.1 and §5.3.6.2, each bus and truck (other than a truck tractor) manufactured on or after July 1, 2005, and each bus and truck (other than a truck tractor) manufactured in two or more stages on or after July 1, 2006, shall stop at least three times within the 12-foot lane, without any part of the vehicle leaving the roadway.

§5.3.6.1 Using a full-treadle brake application for the duration of the stop, stop the vehicle from 30 mph or 75 percent of the maximum drive-through speed, whichever is less, on a 500-foot radius curved roadway with a wet level surface having a peak friction coefficient of 0.5 when measured on a straight or curved section of the curved roadway using an American Society for Testing and Materials (ASTM) E1136 standard reference tire, in accordance with ASTM Method E1337–90, at a speed of 40 mph, with water delivery.

§5.3.6.2 Stop the vehicle, with the vehicle:

(a) Loaded to its GVWR, for a truck tractor; and

(b) At its unloaded weight plus up to 500 pounds (including driver and instrumentation), or at the manufacturer’s option, at its unloaded weight plus up to 500 pounds (including driver and instrumentation) and plus not more than an additional 1000 pounds for a roll bar structure on the vehicle, for a truck, bus, or truck tractor.

§5.4 Service brake system—dynamometer tests. When tested without prior road testing, under the conditions of §6.2, each brake assembly shall meet the requirements of §5.4.1, §5.4.2, and §5.4.3 when tested in sequence and without adjustments other than those specified in the standard. For purposes of the requirements of §5.4.2 and §5.4.3, an average deceleration rate is the change in velocity divided by the deceleration time measured from the onset of deceleration.

§5.4.1 Brake retardation force. The sum of the retardation forces exerted by the brakes on each vehicle designed to be towed by another vehicle equipped with air brakes shall be such that the quotient sum of the brake retardation forces / sum of GAWR’s relative to brake chamber air pressure, and shall have values not less than those shown in Column 1 of Table III. Retardation force shall be determined as follows:

§5.4.1.1 After burnishing the brake pursuant to §6.2.6, retain the brake assembly on the inertia dynamometer. With an initial brake temperature between 125 °F., and 200 °F., conduct a stop from 50 m.p.h., maintaining brake chamber air pressure at a constant 20 psi. Measure the average torque exerted by the brake from the time the specified air pressure is reached until the brake stops and divide by the static loaded tire radius specified by the tire manufacturer to determine the retardation force. Repeat the procedure six times, increasing the brake chamber air pressure by 10 psi each time. After each stop, rotate the brake drum or disc until the temperature of the brake falls to between 125 °F. and 200 °F.

§5.4.2 Brake power. When mounted on an inertia dynamometer, each brake shall be capable of making 10 consecutive decelerations at an average rate of 9 f.p.s.p.s. from 50 m.p.h. to 15 m.p.h., at equal intervals of 72 seconds, and shall be capable of decelerating to a stop from 20 m.p.h. at an average deceleration rate of 14 f.p.s.p.s. 1 minute after the 10th deceleration. The series of decelerations shall be conducted as follows:

§5.4.2.1 With an initial brake temperature between 150 °F. and 200 °F. for the first brake application, and the
drum or disc rotating at a speed equivalent to 50 m.p.h., apply the brake and decelerate at an average deceleration rate of 9 f.p.s.p.s. to 15 m.p.h. Upon reaching 15 m.p.h., accelerate to 50 m.p.h. and apply the brake for a second time 72 seconds after the start of the first application. Repeat the cycle until 10 decelerations have been made. The service line air pressure shall not exceed 100 psi during any deceleration.

S5.4.2.2 One minute after the end of the last deceleration required by S5.4.2.1 and with the drum or disc rotating at a speed of 20 m.p.h., decelerate to a stop at an average deceleration rate of 14 f.p.s.p.s.

S5.4.3 Brake recovery. Except as provided in S5.4.3(a) and (b), starting two minutes after completing the tests required by S5.4.2, a vehicle’s brake shall be capable of making 20 consecutive stops from 30 mph at an average deceleration rate of 12 f.p.s.p.s., at equal intervals of one minute measured from the start of each brake application. The service line air pressure needed to attain a rate of 12 f.p.s.p.s. shall be not more than 85 lb/in², and not less than 20 lb/in² for a brake not subject to the control of an antilock system, or 12 lb/in² for a brake subject to the control of an antilock system.

(a) Notwithstanding S5.4.3, neither front axle brake of a truck-tractor is subject to the requirements set forth in S5.4.3.

(b) Notwithstanding S5.4.3, neither front axle brake of a bus or a truck other than a truck-tractor is subject to the requirement set forth in S5.4.3 prohibiting the service line air pressure from being less than 20 lb/in² for a brake not subject to the control of an antilock system or 12 lb/in² for a brake subject to the control of an antilock system.

S5.5 Antilock system.
S5.5.1 Antilock system malfunction. On a truck tractor manufactured on or after March 1, 1997, that is equipped with an antilock brake system and a single unit vehicle manufactured on or after March 1, 1998, that is equipped with an antilock brake system, a malfunction that affects the generation or transmission of response or control signals of any part of the antilock system shall not increase the actuation and release times of the service brakes.

S5.5.2 Antilock system power—trailers. On a trailer (including a trailer converter dolly) manufactured on or after March 1, 1998, that is equipped with an antilock system that requires electrical power for operation, the power shall be obtained from the towing vehicle through one or more electrical circuits which provide continuous power whenever the powered vehicle's ignition (start) switch is in the “on” (“run”) position. The antilock system shall automatically receive power from the stoplamp circuit, if the primary circuit or circuits are not functioning. Each trailer (including a trailer converter dolly) manufactured on or after March 1, 1998, that is equipped to tow another air-braked vehicle shall be equipped with one or more circuits which provide continuous power to the antilock system on the vehicle(s) it tows. Such circuits shall be adequate to enable the antilock system on each towed vehicle to be fully operable.

S5.6 Parking brakes.
(a) Except as provided in S5.6(b) and S5.6(c), each vehicle other than a trailer converter dolly shall have a parking brake system that under the conditions of S6.1 meets the requirements of:

(1) S5.6.1 or S5.6.2, at the manufacturer’s option, and

(2) S5.6.3, S5.6.4, S5.6.5, and S5.6.6.

(b) At the option of the manufacturer, for vehicles equipped with brake systems which incorporate a common diaphragm, the performance requirements specified in S5.6(a) which must be met with any single leakage-type failure in a common diaphragm may instead be met with the level of leakage-type failure determined in S5.6.7. The election of this option does not affect the performance requirements specified in S5.6(a) which apply with single leakage-type failures other than failures in a common diaphragm.

(c) At the option of the manufacturer, the trailer portion of any agricultural commodity trailer, heavy hauler trailer, or pulpwood trailer may meet the requirements of §393.49 of this title instead of the requirements of S5.6(a).
§571.121 Static retardation force. With all other brakes made inoperative, during a static drawbar pull in a forward or rearward direction, the static retardation force produced by the application of the parking brakes shall be:

(a) In the case of a vehicle other than a truck-tractor that is equipped with more than two axles, such that the quotient static retardation force/GAWR is not less than 0.28 for any axle other than a steerable front axle; and

(b) In the case of a truck-tractor that is equipped with more than two axles, such that the quotient static retardation force/GVWR is not less than 0.14.

§571.122 Grade holding. With all parking brakes applied, the vehicle shall remain stationary facing uphill and facing downhill on a smooth, dry portland cement concrete roadway with a 20-percent grade, both

(a) When loaded to its GVWR, and

(b) At its unloaded vehicle weight plus 1500 pounds (including driver and instrumentation and roll bar).

§571.123 Application and holding. Each parking brake system shall meet the requirements of §571.123.1 through §571.123.4.

§571.123.1 The parking brake system shall be capable of achieving the minimum performance specified either in §571.123.1 or §571.123.2 with any single leakage-type failure, in any other brake system, of a part designed to contain compressed air or brake fluid (excluding failure of a component of a brake chamber housing but including failure of any brake chamber diaphragm that is part of any other brake system including a diaphragm which is common to the parking brake system and any other brake system), when the pressures in the vehicle's parking brake chambers are at the levels determined in §571.123.4.

§571.123.2 A mechanical means shall be provided that, after a parking brake application with sufficient parking retardation force to meet the minimum performance specified in §571.123.1 and in either §571.123.1 or §571.123.2.

§571.123.3 For trucks and buses, with an initial reservoir system pressure of 100 psi and, if designed to tow a vehicle equipped with air brakes, with a 50 cubic inch test reservoir connected to the supply line coupling, no later than three seconds from the time of actuation of the parking brake control, the mechanical means referred to in §571.123.2 shall be actuated. For trailers, with the supply line initially pressurized to 100 psi using the supply line portion of the trailer test rig (Figure 1) and, if designed to tow a vehicle equipped with air brakes, with a 50 cubic inch test reservoir connected to the rear supply line coupling, no later than three seconds from the time venting to the atmosphere of the front supply line coupling is initiated, the mechanical means referred to in §571.123.2 shall be actuated. This requirement shall be met for trucks, buses and trailers both with and without any single leakage-type failure, in any other brake system, of a part designed to contain compressed air or brake fluid (consistent with the parenthetical phrase specified in §571.123.1).

§571.123.4 The parking brake chamber pressures for §571.123.1 and §571.123.2 are determined as follows. For trucks and buses, with an initial reservoir system pressure of 100 psi and, if designed to tow a vehicle equipped with air brakes, with a 50 cubic inch test reservoir connected to the supply line coupling, any single leakage type failure, in any other brake system, of a part designed to contain compressed air or brake fluid (consistent with the parenthetical phrase specified in §571.123.1), is introduced in the brake system. The parking brake control is actuated and the pressures in the vehicle's parking brake chambers are measured three seconds after that actuation is initiated. For trailers, with the supply line initially pressurized to 100 psi using the supply line portion of the trailer test rig (Figure 1) and, if designed to tow a vehicle equipped with air brakes, with a 50 cubic inch test reservoir connected to the rear supply line coupling, any single leakage type failure, in any other brake system, of a part designed to contain compressed air or brake fluid (consistent with the parenthetical phrase specified in §571.123.1), is introduced in the brake system. The parking brake control is actuated and the pressures in the vehicle's parking brake chambers are measured three seconds after that actuation is initiated. For trailers, with the supply line initially pressurized to 100 psi using the supply line portion of the trailer test rig (Figure 1) and, if designed to tow a vehicle equipped with air brakes, with a 50 cubic inch test reservoir connected to the rear supply line coupling, any single leakage type failure, in any other brake system, of a part designed to contain compressed air or brake fluid (consistent with the parenthetical phrase specified in §571.123.1), is introduced in the brake system. The parking brake control is actuated and the pressures in the vehicle's parking brake chambers are measured three seconds after that actuation is initiated.
fluid (consistent with the parenthetical phrase specified in §5.6.3.1), is introduced in the brake system. The front supply line coupling is vented to the atmosphere and the pressures in the vehicle’s parking brake chambers are measured three seconds after that venting is initiated.

§5.6.4 Parking brake control—trucks and buses. The parking brake control shall be separate from the service brake control. It shall be operable by a person seated in the normal driving position. The control shall be identified in a manner that specifies the method of control operation. The parking brake control shall control the parking brakes of the vehicle and of any air braked vehicle that it is designed to tow.

§5.6.5 Release Performance. Each parking brake system shall meet the requirements specified in §5.6.5.1 through §5.6.5.4.

§5.6.5.1 For trucks and buses, with initial conditions as specified in §5.6.5.2, at all times after an application actuation of the parking brake control, and with any subsequent level of pressure, or combination of levels of pressure, in the reservoirs of any of the vehicle’s brake systems, no reduction in parking brake retardation force shall result from a release actuation of the parking brake control unless the parking brakes are capable, after such release, of reaplication at a level meeting the minimum performance specified either in §5.6.1 or §5.6.2. This requirement shall be met both with and without any single leakage-type failure, in any other brake system, of a part designed to contain compressed air or brake fluid (consistent with the parenthetical phrase specified in §5.6.3.1).

§5.6.5.2 The initial conditions for §5.6.5.1 are as follows: The reservoir system and supply line are pressurized to 100 psi, using the supply line portion of the trailer test rig (Figure 1). If the vehicle is designed to tow a vehicle equipped with air brakes, a 50 cubic inch test reservoir is connected to the rear supply line coupling.

§5.6.6 Accumulation of actuation energy. Each parking brake system shall meet the requirements specified in §5.6.6.1 through §5.6.6.6.

§5.6.6.1 For trucks and buses, with initial conditions as specified in §5.6.6.2, the parking brake system shall be capable of meeting the minimum performance specified either in §5.6.1 or §5.6.2. This requirement shall be met both with and without the engine on, and with and without single leakage-type failure, in any other brake system, of a part designed to contain compressed air or brake fluid (consistent with the parenthetical phrase specified in §5.6.3.1).

§5.6.6.2 The initial conditions for §5.6.6.1 are as follows: The engine is on. The reservoir system pressure is 100 psi. If the vehicle is designed to tow a vehicle equipped with air brakes, a 50 cubic inch test reservoir is connected to the supply line coupling.

§5.6.6.3 The test sequence for §5.6.6.1 is as follows: The engine is turned off. Any single leakage type failure, in any other brake system, of a part designed to contain compressed air or brake fluid (consistent with the
parenthetical phrase specified in S5.6.3.1), is then introduced in the brake system. An application actuation of the parking brake control is then made. Thirty seconds after such actuation, a release actuation of the parking brake control is made. Thirty seconds after the release actuation, a final application actuation of the parking brake control is made.

S5.6.6.4 For trailers, with initial conditions as specified in S5.6.6.5, the parking brake system shall be capable of meeting the minimum performance specified either in S5.6.1 or S5.6.2, with any single leakage-type failure, in any other brake system, of a part designed to contain compressed air or brake fluid (consistent with the parenthetical phrase specified in S5.6.3.1), at the conclusion of the test sequence specified in S5.6.6.6.

S5.6.6.5 The initial conditions for S5.6.6.4 are as follows: The reservoir system and supply line are pressurized to 100 psi, using the supply line portion of the trailer test rig (Figure 1). If the vehicle is designed to tow a vehicle equipped with air brakes, a 50 cubic inch test reservoir is connected to the rear supply line coupling.

S5.6.6.6 The test sequence for S5.6.6.4 is as follows. Any single leakage type failure, in any other brake system, of a part designed to contain compressed air or brake fluid (consistent with the parenthetical phrase specified in S5.6.3.1), is introduced in the brake system. The front supply line coupling is vented to the atmosphere. Thirty seconds after the initiation of such venting, the supply line is repressurized with the trailer test rig (Figure 1). Thirty seconds after the initiation of such repressurizing of the supply line, the front supply line is repressed in the atmosphere. This procedure is conducted either by connection and disconnection of the supply line coupling or by use of a valve installed in the supply line portion of the trailer test rig near the supply line coupling.

S5.6.7 Maximum level of common diaphragm leakage-type failure/ Equivalent level of leakage from the air chamber containing that diaphragm. In the case of vehicles for which the option in S5.6(b) has been elected, determine the maximum level of common diaphragm leakage-type failure (or equivalent level of leakage from the air chamber containing that diaphragm) according to the procedures set forth in S5.6.7.1 through S5.6.7.2.3.

S5.6.7.1 Trucks and buses.

S5.6.7.1.1 According to the following procedure, determine the threshold level of common diaphragm leakage-type failure (or equivalent level of leakage from the air chamber containing that diaphragm) at which the vehicle’s parking brakes become unreleasable. With an initial reservoir system pressure of 100 psi, the engine turned off, no application of any of the vehicle’s brakes, and, if the vehicle is designed to tow a vehicle equipped with air brakes, a 50 cubic inch test reservoir connected to the supply line coupling, introduce a leakage-type failure of the common diaphragm (or equivalent leakage from the air chamber containing that diaphragm). Apply the parking brakes by making an application actuation of the parking brake control. Reduce the pressures in all of the vehicle’s reservoirs to zero, turn on the engine and allow it to idle, and allow the pressures in the vehicle’s reservoirs to rise until they stabilize or until the compressor shut-off point is reached. At that time, make a release actuation of the parking brake control, and determine whether all of the mechanical means referred to in S5.6.3.2 continue to be actuated and hold the parking brake applications with sufficient parking retardation force to meet the minimum performance specified in either S5.6.1 or S5.6.2. Repeat this procedure with progressively decreasing or increasing levels (whichever is applicable) of leakage-type diaphragm failures or equivalent leakages, to determine the minimum level of common diaphragm leakage-type failure (or equivalent level of leakage from the air chamber containing that diaphragm) at which all of the mechanical means referred to in S5.6.3.2 continue to be actuated and hold the parking brake applications with sufficient parking retardation force to meet the minimum performance specified in either S5.6.1 or S5.6.2.

S5.6.7.1.2 At the level of common diaphragm leakage-type failure (or equivalent level of leakage from the air
chamber containing that diaphragm) determined in §5.6.7.1.1, and using the following procedure, determine the threshold maximum reservoir rate (in psi per minute). With an initial reservoir system pressure of 100 psi, the engine turned off, no application of any of the vehicle’s brakes and, if the vehicle is designed to tow a vehicle equipped with air brakes, a 50 cubic inch test reservoir connected to the supply line coupling, introduce a leakage-type failure of the common diaphragm (or equivalent leakage from the air chamber containing that diaphragm). Make a parking brake application by venting the front supply line coupling to the atmosphere, and reduce the pressures in all of the vehicle’s reservoirs to zero. Pressurize the supply line by connecting the trailer’s front supply line coupling to the supply line portion of the trailer test rig (Figure 1) with the regulator of the trailer test rig set at 100 psi, and determine whether all of the mechanical means referred to in §5.6.3.2 continue to be actuated and hold the parking brake applications with sufficient parking retardation forces to meet the minimum performance specified in either §5.6.1 or §5.6.2. Repeat this procedure with progressively decreasing or increasing levels (whichever is applicable) of leakage-type diaphragm failures or equivalent leakages, to determine the minimum level of common diaphragm leakage-type failure (or equivalent level of leakage from the air chamber containing that diaphragm) at which all of the mechanical means referred to in §5.6.3.2 continue to be actuated and hold the parking brake applications with sufficient parking retardation forces to meet the minimum performance specified in either §5.6.1 or §5.6.2.

§5.6.7.2.2 At the level of common diaphragm leakage-type failure (or equivalent level of leakage from the air chamber containing that diaphragm) determined in §5.6.7.2.1, and using the following procedure, determine the threshold maximum reservoir leakage rate (in psi per minute). With an initial reservoir system and supply line pressure of 100 psi, no application of any of the vehicle’s brakes and, if the vehicle is designed to tow a vehicle equipped with air brakes, a 50 cubic inch test reservoir connected to the rear supply line coupling, make a parking brake application by venting the front supply line coupling to the atmosphere. Determine the maximum reservoir leakage rate (in psi per minute), which is the
maximum rate of decrease in air pressure of any of the vehicle’s reservoirs that results after that parking brake application.

S5.6.7.2.3 Using the following procedure, a leakage-type failure of the common diaphragm (or equivalent leakage from the air chamber containing that diaphragm) that results in a maximum reservoir leakage rate that is three times the threshold maximum reservoir leakage rate determined in S5.6.7.2.2. With an initial reservoir system and supply line pressure of 100 psi, no application of any of the vehicle’s brakes and, if the vehicle is designed to tow a vehicle equipped with air brakes, a 50 cubic inch test reservoir connected to the rear supply line coupling, make a parking brake application by venting the front supply line coupling to the atmosphere. Determine the maximum reservoir leakage rate (in psi per minute), which is the maximum rate of decrease in air pressure of any of the vehicle’s reservoirs that results after that parking brake application. The level of common diaphragm leakage-type failure (or equivalent level of leakage from the air chamber containing that diaphragm) associated with this reservoir leakage rate is the level that is to be used under the option set forth in S5.6(b).

S5.7 Emergency brake system for trucks and buses. Each vehicle shall be equipped with an emergency brake system which, under the conditions of S6.1, conforms to the requirements of S5.7.1 through S5.7.3. However, the truck portion of an auto transporter need not meet the road test requirements of S5.7.1 and S5.7.3.

S5.7.1 Emergency brake system performance. When stopped six times for each combination of weight and speed specified in S6.3.1.1, except for a loaded truck tractor with an unbraked control trailer, on a road surface having a PFC of 0.9, with a single failure in the service brake system of a part designed to contain compressed air or brake fluid (except failure of a common valve, manifold, brake fluid housing, or brake chamber housing), the vehicle shall stop at least once in not more than the distance specified in Column 5 of Table II, measured from the point at which movement of the service brake control begins, except that a truck-tractor tested at its unloaded vehicle weight plus up to 1500 pounds shall stop at least once in not more than the distance specified in Column 6 of Table II. The stop shall be made without any part of the vehicle leaving the roadway, and with unlimited wheel lockup permitted at any speed.

S5.7.2 Emergency brake system operation. The emergency brake system shall be applied and released, and be capable of modulation, by means of the service brake control.

S5.7.3 Towing vehicle emergency brake requirements. In addition to meeting the other requirements of S5.7, a vehicle designed to tow another vehicle equipped with air brakes shall—

(a) In the case of a truck-tractor in the unloaded condition and a single unit truck which is capable of towing an air brake equipped vehicle and is loaded to GVWR, be capable of meeting the requirements of S5.7.1 by operation of the service brake control only, with the trailer air supply line and air control line from the towing vehicle vented to the atmosphere in accordance with S6.1.14;

(b) Be capable of modulating the air in the supply or control line to the trailer by means of the service brake control with a single failure in the towing vehicle service brake system as specified in S5.7.1.

(c) [Reserved]

S5.8 Emergency brakes for trailers. Each trailer shall meet the requirements of S5.8.1 through S5.8.3.

S5.8.1 Emergency braking capability. Each trailer other than a trailer converter dolly shall have a parking brake system that conforms to S5.6 and that applies with the force specified in S5.6.1 or S5.6.2 when the air pressure in the supply line is at atmospheric pressure. A trailer converter dolly shall have, at the manufacturer’s option—

(a) A parking brake system that conforms to S5.6 and that applies with the force specified in S5.6.1 or S5.6.2 when the air pressure in the supply line is at atmospheric pressure, or

(b) An emergency system that automatically applies the service brakes when the service reservoir is at any pressure above 20 lb/in² and the supply
line is at atmospheric pressure. However, any agricultural commodity trailer, heavy hauler trailer, or pulpwood trailer shall meet the requirements of S5.8.1 or, at the option of the manufacturer, the requirements of §393.43 of this title.

S5.8.2 Supply line pressure retention. Any single leakage type failure in the service brake system (except for a failure of the supply line, a valve directly connected to the supply line or a component of a brake chamber housing) shall not result in the pressure in the supply line falling below 70 psi, measured at the forward trailer supply coupling. A trailer shall meet the above supply line pressure retention requirement with its brake system connected to the trailer test rig shown in Figure 1, with the reservoirs of the trailer and test rig initially pressurized to 100 psi and the regulator of the trailer test rig set at 100 psi; except that a trailer equipped with an air-applied, mechanically-held parking brake system and not designed to tow a vehicle equipped with air brakes, at the manufacturer's option, may meet the requirements of S5.8.4 rather than those of S5.8.2 and S5.8.3.

S5.8.3 Automatic application of parking brakes. With an initial reservoir system pressure of 100 psi and initial supply line pressure of 100 psi, and if designed to tow a vehicle equipped with air brakes, with a 50 cubic inch test reservoir connected to the rear supply line coupling, and with any subsequent single leakage type failure in any other brake system, of a part designed to contain compressed air or brake fluid (consistent with the parenthetical phrase specified in S5.6.3.1), whenever the air pressure in the supply line is 70 psi or higher, the parking brakes shall not provide any brake retardation as a result of complete or partial automatic application of the parking brakes.

S5.8.4 Automatic application of air-applied, mechanically-held parking brakes. With its brake system connected to the supply line portion of the trailer test rig (Figure 1) and the regulator of the trailer test rig set at 100 psi, and with any single leakage type failure in the service brake system (except for a failure of the supply line, a valve directly connected to the supply line or a component of a brake chamber, but including failure of any common diaphragm), the parking brakes shall not provide any brake retardation as a result of complete or partial automatic application of the parking brakes.

S5.9 Final inspection. Inspect the service brake system for the condition of adjustment and for the brake indicator display in accordance with S5.1.8 and S5.2.2.

S6. Conditions. The requirements of S5 shall be met by a vehicle when it is tested according to the conditions set in this S6, without replacing any brake system part or making any adjustments to the brake system except as specified. Unless otherwise specified, where a range of conditions is specified, the vehicle must be capable of meeting the requirements at all points within the range. On vehicles equipped with automatic brake adjusters, the automatic brake adjusters must remain activated at all times. Compliance of vehicles manufactured in two or more stages may, at the option of the final-stage manufacturer, be demonstrated to comply with this standard by adherence to the instructions of the incomplete vehicle manufacturer provided with the vehicle in accordance with §568.4(a)(7)(ii) and §568.5 of title 49 of the Code of Federal Regulations.

S6.1 Road test conditions.

S6.1.1 Except as otherwise specified, the vehicle is loaded to its GVWR, distributed proportionally to its GAWRs. During the burnish procedure specified in S6.1.8, truck tractors shall be loaded to their GVWR, by coupling them to an unbraked flatbed semitrailer, which semitrailer shall be loaded so that the weight of the tractor-trailer combination equals the GVWR of the truck tractor. The load on the unbraked flatbed semitrailer shall be located so that the truck tractor’s wheels do not lock during burnish.

S6.1.2 The inflation pressure is as specified by the vehicle manufacturer for the GVWR.

S6.1.3 Unless otherwise specified, the transmission selector control is in neutral or the clutch is disengaged during all decelerations and during static parking brake tests.

S6.1.4 All vehicle openings (doors, windows, hood, trunk, cargo doors,
S6.1.5 The ambient temperature is between 32 °F and 100 °F.

S6.1.6 The wind velocity is zero.

S6.1.7 Unless otherwise specified, stopping tests are conducted on a 12-foot wide level, straight roadway having a peak friction coefficient of 0.9. For road tests in §5.3, the vehicle is aligned in the center of the roadway at the beginning of a stop. Peak friction coefficient is measured using an ASTM E1136 standard reference test tire in accordance with ASTM method E1337–90, at a speed of 40 mph, without water delivery for the surface with PFC of 0.9, and with water delivery for the surface with PFC of 0.5.

S6.1.8 For vehicles with parking brake systems not utilizing the service brake friction elements, burnish the friction elements of such systems prior to the parking brake test according to the manufacturer’s recommendations. For vehicles with parking brake systems utilizing the service brake friction elements, burnish the brakes as follows: With the transmission in the highest gear appropriate for a speed of 40 mph, make 500 snubs between 40 mph and 20 mph at a deceleration rate of 10 f.p.s.p.s., or at the vehicle’s maximum deceleration rate if less than 10 f.p.s.p.s. Except where an adjustment is specified, after each brake application accelerate to 40 mph and maintain that speed until making the next brake application at a point 1 mile from the initial point of the previous brake application. If the vehicle cannot attain a speed of 40 mph in 1 mile, continue to accelerate until the vehicle reaches 40 mph or until the vehicle has traveled 1.5 miles from the initial point of the previous brake application, whichever occurs first. Any automatic pressure limiting valve is in use to limit pressure as designed. The brakes may be adjusted up to three times during the burnish procedure, at intervals specified by the vehicle manufacturer, and may be adjusted at the conclusion of the burnishing, in accordance with the vehicle manufacturer’s recommendation.

S6.1.9 Static parking brake tests for a semitrailer are conducted with the front-end supported by an unbraked dolly. The weight of the dolly is included as part of the trailer load.

S6.1.10 In a test other than a static parking test, a truck tractor is tested at its GVWR by coupling it to an unbraked flatbed semi-trailer (hereafter, control trailer) as specified in §6.1.10.2 to §6.1.10.4.

S6.1.10.1 [Reserved]

S6.1.10.2 The center of gravity height of the ballast on the loaded control trailer shall be less than 24 inches above the top of the tractor’s fifth wheel.

S6.1.10.3 The control trailer has a single axle with a GAWR of 18,000 pounds and a length, measured from the transverse centerline of the axle to the centerline of the kingpin, of 258 ±6 inches.

S6.1.10.4 The control trailer is loaded so that its axle is loaded at 4,500 pounds and the tractor is loaded to its GVWR, loaded above the kingpin only, with the tractor’s fifth wheel adjusted so that the load on each axle measured at the tire-ground interface is most nearly proportional to the axes’ respective GAWRs, without exceeding the GAWR of the tractor’s axle or axles or control trailer’s axle.

S6.1.11 Special drive conditions. A vehicle equipped with an interlocking axle system or a front wheel drive system that is engaged and disengaged by the driver is tested with the system disengaged.

S6.1.12 Liftable axles. A vehicle with a liftable axle is tested at GVWR with the liftable axle down and at unloaded vehicle weight with the liftable axle up.

S6.1.13 Trailer test rig.

The trailer test rig shown in Figure 1 is calibrated in accordance with the calibration curves shown in Figure 3. For the requirements of §5.3.3.1 and §5.3.4.1, the pressure in the trailer test rig reservoir is initially set at 100 psi for actuation tests and 95 psi for release tests.

S6.1.14 In testing the emergency braking system of towing vehicles under §5.7.3(a), the hose(s) is vented to the atmosphere at any time not less than 1 second and not more than 1 minute before the emergency stop begins, while the vehicle is moving at the speed from which the stop is to be
made and any manual control for the towing vehicle protection system is in the position to supply air and brake control signals to the vehicle being towed. No brake application is made from the time the line(s) is vented until the emergency stop begins and no manual operation of the parking brake system or towing vehicle protection system occurs from the time the line(s) is vented until the stop is completed.

S6.1.15 Initial brake temperature. Unless otherwise specified, the initial brake temperature is not less than 150°F and not more than 200°F.

S6.1.16 Thermocouples. The brake temperature is measured by plug-type thermocouples installed in the approximate center of the facing length and width of the most heavily loaded shoe or disc pad, one per brake, as shown in Figure 2. A second thermocouple may be installed at the beginning of the test sequence if the lining wear is expected to reach a point causing the first thermocouple to contact the rubbing surface of a drum or rotor. The second thermocouple shall be installed at a depth of .080 inch and located within 1 inch circumferentially of the thermocouple installed at .040 inch depth. For centergrooved shoes or pads, thermocouples are installed within one-eighth of an inch to one-quarter of an inch of the groove and as close to the center as possible.

S6.1.17 Selection of compliance options. Where manufacturer options are specified, the manufacturer shall select the option by the time it certifies the vehicle and may not thereafter select a different option for the vehicle. Each manufacturer shall, upon request from the National Highway Traffic Safety Administration, provide information regarding which of the compliance options it has selected for a particular vehicle or make/model.

S6.2 Dynamometer test conditions.

S6.2.1 The dynamometer inertia for each wheel is equivalent to the load on the wheel with the axle loaded to its GAWR. For a vehicle having additional GAWRs specified for operation at reduced speeds, the GAWR used is that specified for a speed of 50 mph, or, at the option of the manufacturer, any speed greater than 50 mph.

S6.2.2 The ambient temperature is between 75°F and 100°F.

S6.2.3 Air at ambient temperature is directed uniformly and continuously over the brake drum or disc at a velocity of 2,200 feet per minute.

S6.2.4 The temperature of each brake is measured by a single plug-type thermocouple installed in the center of the lining surface of the most heavily loaded shoe or pad as shown in Figure 2. The thermocouple is outside any center groove.

S6.2.5 The rate of brake drum or disc rotation on a dynamometer corresponding to the rate of rotation on a vehicle at a given speed is calculated by assuming a tire radius equal to the static loaded radius specified by the tire manufacturer.

S6.2.6 Brakes are burnished before testing as follows: place the brake assembly on an inertia dynamometer and adjust the brake as recommended by the vehicle manufacturer. Make 200 stops from 40 mph at a deceleration of 10 f.p.s.p.s., with an initial brake temperature on each stop of not less than 315°F and not more than 385°F. Make 200 additional stops from 40 mph at a deceleration of 10 f.p.s.p.s. with an initial brake temperature on each stop of not less than 450°F and not more than 550°F. The brakes may be adjusted up to three times during the burnish procedure, at intervals specified by the vehicle manufacturer, and may be adjusted at the conclusion of the burnishing, in accordance with the vehicle manufacturer’s recommendation.

S6.2.7 The brake temperature is increased to a specified level by conducting one or more stops from 40 m.p.h. at a deceleration of 10 f.p.s.p.s. The brake temperature is decreased to a specified level by rotating the drum or disc at a constant 30 m.p.h.

§571.122 Standard No. 122; Motorcycle brake systems.

S1. Scope. This standard specifies performance requirements for motorcycle brake systems.

S2. Purpose. The purpose of the standard is to insure safe motorcycle braking performance under normal and emergency conditions.

S3. Application. This standard applies to motorcycles.

S4. Definitions. Braking interval means the distance measured from the start of one brake application to the start of the next brake application. Initial brake temperature means the temperature of the hottest service brake of the vehicle 0.2 mile before any brake application.

575
§ 571.122 49 CFR Ch. V (10–1–08 Edition)

Skid number means the frictional resistance of a pavement measured in accordance with American Society for Testing and Materials (ASTM) Method E-274–70 (as revised July, 1974) at 40 mph, omitting water delivery as specified in paragraphs 7.1 and 7.2 of that method.

Stopping distance means the distance traveled by a vehicle from the start of the brake application to the point where the vehicle stops.

Split service brake system means a brake system consisting of two or more subsystems actuated by a single control designed so that a leakage-type failure of a pressure component in a single subsystem (except structural failure of a housing that is common to all subsystems) shall not impair the operation of the other subsystem(s).

§ 5. Requirements. Each motorcycle shall meet the following requirements under the conditions specified in §6, when tested according to the procedures and in the sequence specified in §7. Corresponding test procedures of §7 are indicated in parentheses. If a motorcycle is incapable of attaining a specified speed, its service brakes shall be capable of stopping the vehicle from the multiple of 5 m.p.h. that is 4 m.p.h. to 8 m.p.h. less than the speed attainable in 1 mile, within stopping distances that do not exceed the stopping distances specified in Table 1.

§ 5.1 Required equipment—split service brake system. Each motorcycle shall have either a split service brake system or two independently actuated service brake systems.

§ 5.1.1 Mechanical service brake system. Failure of any component in a mechanical service brake system shall not result in a loss of braking ability in the other service brake system on the vehicle.

§ 5.1.2 Hydraulic service brake system. A leakage failure in a hydraulic service brake system shall not result in a loss of braking ability in the other service brake system on the vehicle. Each motorcycle equipped with a hydraulic brake system shall have the equipment specified in §5.1.2.1 and §5.1.2.2.

§ 5.1.2.1 Master cylinder reservoirs. Each master cylinder shall have a separate reservoir for each brake circuit, with each reservoir filler opening hav-
than one-half the fluid reservoir capacity, whichever is the greater.

(b) All failure indicator lamps shall be activated when the ignition switch is turned from the "off" to the "on" or to the "start" position.

(c) Except for the momentary activation required by §5.1.3.1(b), each indicator lamp, once activated, shall remain activated as long as the condition exists, whenever the ignition switch is in the "on" position. An indicator lamp activated when the ignition is turned to the "start" position shall be deactivated upon return of the switch to the "on" position unless a failure exists in the service brake system.

(d) Each indicator lamp shall have a red lens with the legend "Brake Failure" on or adjacent to it in letters not less than thirty-three seconds of an inch high that shall be legible to the driver in daylight when lighted.

§5.1.4 Parking brake. Each three-wheeled motorcycle shall be equipped with a parking brake of a friction type with a solely mechanical means to retain engagement.

§5.1.5 Other requirements. The brake system shall be installed so that the lining thickness of drum brake shoes may be visually inspected, either directly or by use of a mirror without removing the drums, and so that disc brake friction lining thickness may be visually inspected without removing the pads.

§5.2 Service brake system—first (preburnish) effectiveness.

§5.2.1 Service brake system. The service brakes shall be capable of stopping the motorcycle from 30 m.p.h. and 60 m.p.h. within stopping distances which do not exceed the stopping distances specified in Column I of Table I (§7.3.1).

§5.2.2 Partial service brake system. Each independently actuated service brake system on each motorcycle shall be capable of stopping the motorcycle from 30 m.p.h. and 60 m.p.h. within stopping distances which do not exceed the stopping distances specified in Column II of Table I (§7.3.2).

§5.3 Service brake system—second effectiveness. The service brakes shall be capable of stopping the motorcycle from 30 m.p.h., 60 m.p.h., 80 m.p.h., and the multiple of 5 m.p.h. that is 4 m.p.h. to 8 m.p.h. less than the speed attainable in 1 mile if this speed is 95 m.p.h. or greater, within stopping distances that do not exceed the stopping distances specified in Column III of Table I (§7.5).

§5.4 Service brake system—fade and recovery. These requirements do not apply to a motor-driven cycle whose speed attainable in 1 mile is 30 m.p.h. or less.

§5.4.1 Baseline check—minimum and maximum pedal forces. The pedal and lever forces used in establishing the fade baseline check average shall be within the limits specified in §6.10 (§7.6.1).

§5.4.2 Fade. Each motorcycle shall be capable of making 10 fade stops from 60 m.p.h. at not less than 15 f.p.s.p.s. for each stop (§7.6.2).

§5.4.3 Fade recovery. Each motorcycle shall be capable of making five recovery stops with a pedal force that does not exceed 400 Newtons (90 pounds), and a hand lever force that does not exceed 245 Newtons (55 pounds) for any of the first four recovery stops and that for the fifth recovery stop, is within, plus 89 Newtons (20 pounds) and minus 44 Newtons (10 pounds) of the fade test baseline check average force (§7.6.3), but not less than 0 Newtons (0 pounds).

§5.5 Service brake system—final effectiveness. These requirements do not apply to a motor-driven cycle whose speed attainable in 1 mile is 30 mph or less.

§5.5.1 Service brake system. The service brakes shall be capable of stopping the motorcycle in a manner that complies with §5.3 (§7.8.1).

§5.5.2 Hydraulic service brake system—partial failure. In the event of a pressure component leakage failure, other than a structural failure of either a brake master cylinder body in a split integral body type master cylinder system or a service brake system failure indicator body, the remaining portion of the service brake system shall continue to operate and shall be capable of stopping the motorcycle from 30 m.p.h. and 60 m.p.h. within stopping distances that do not exceed the stopping distances specified in Column IV of Table I (§7.8.2).

§5.6 Parking brake system. The parking brake system shall be capable of
holding the motorcycle stationary (to the limits of traction of the braked wheels), for 5 minutes, in both forward and reverse directions, on a 30 percent grade, with an applied force of not more than 90 pounds for a foot-operated system and 55 pounds for a hand-operated system (§7.9).

§5.7 Service brake system—water recovery.

§5.7.1 Baseline check. The pedal and lever forces used in establishing the water recovery baseline check average shall be within the limits specified in §6.10 (§7.10.1).

§5.7.2 Water recovery test. Each motorcycle shall be capable of making five recovery stops with a pedal force that does not exceed 400 Newtons (90 pounds), and hand lever force that does not exceed 245 Newtons (55 pounds), for any of the first four recovery stops, and that for the fifth recovery stop, is within, plus 89 Newtons (20 pounds) and minus 44 Newtons (10 pounds) of the water recovery baseline check average force (§7.10.2), but not less than 0 Newtons (0 pounds).

§5.8 Service brake system design durability. Each motorcycle shall be capable of completing all braking requirements of §§ without detachment of brake linings from the shoes or pad, detachment or fracture of any brake system components, or leakage of fluid or lubricant at the wheel cylinder, and master cylinder reservoir cover, seal, or retention device (§7.11).

§6 Test conditions. The requirements of §5 shall be met under the following conditions. Where a range of conditions is specified, the motorcycle shall be capable of meeting the requirements at all points within the range.

§6.1 Vehicle weight. Motorcycle weight is unloaded vehicle weight plus 200 pounds (including driver and instrumentation), with the added weight distributed in the saddle or carrier if so equipped.

§6.2 Tire inflation pressure. Tire inflation pressure is the pressure recommended by the manufacturer for the vehicle weight specified in paragraph §6.1.

§6.3 Transmission. Unless otherwise specified, all stops are made with the clutch disengaged.

§6.4 Engine. Engine idle speed and ignition timing settings are according to the manufacturer’s recommendations. If the vehicle is equipped with an adjustable engine speed governor, it is adjusted according to the manufacturer’s recommendation.

§6.5 Ambient temperature. The ambient temperature is between 32 °F and 100 °F.

§6.6 Wind velocity. The wind velocity is zero.

§6.7 Road surface. Road tests are conducted on level roadway having a skid number of 81. The roadway is 8 feet wide for two-wheeled motorcycles, and overall vehicle width plus 5 feet for three-wheeled motorcycles. The parking brake test surface is clean, dry, smooth portland cement concrete.

§6.8 Vehicle position. The motorcycle is aligned in the center of the roadway at the start of each brake application. Stops are made without any part of the motorcycle leaving the roadway and without lockup of any wheel.

§6.9 Thermocouples. The brake temperature is measured by plug-type thermocouples installed in the approximate center of the facing length and width of the most heavily loaded shoe or disc pad, one per brake, as shown in Figure 1.

§6.10 Brake actuation forces. Except for the requirements of the fifth recovery stop in §§4.3 and 5.7.2 (§7.6.3 and §7.10.2), the hand lever force is not less than 10 Newtons (2.3 pounds) and not more than 245 Newtons (55 pounds) and the foot pedal force is not less than 25 Newtons (5.6 pounds) and not more than 400 Newtons (90 pounds). The point of initial application of the lever forces is 1.2 inches from the end of the brake lever grip. The direction of the force is perpendicular to the handle grip on the plane along which the brake lever rotates, and the point of application of the pedal force is the center of the foot contact pad of the brake pedal. The direction of the force is perpendicular to the foot contact pad on the plane along which the brake pedal rotates, as shown in Figure 2.

§7 Test procedures and sequence. Each motorcycle shall be capable of meeting all the requirements of this standard when tested according to the procedures and in the sequence set forth.
below without replacing any brake system part, or making any adjustments to the brake system other than as permitted in §571.122. A motorcycle shall be deemed to comply with §571.122 below without replacing any brake system part, or making any adjustments to the brake system other than as permitted in §571.122. A motorcycle shall be deemed to comply with §571.122 below if at least one of the stops specified in §571.122 is made within the stopping distances specified in Table I.

57.1 Braking warming. If the initial brake temperature for the first stop in a test procedure (other than §571.122.10) has not been reached, heat the brakes to the initial brake temperature by making up to 10 stops from 30 m.p.h. at a deceleration of not more than 10 f.p.s.p.s. On independently operated brake systems, the coldest brake shall be within 10 °F. of the hottest brake.

57.2 Pretest instrumentation check. Conduct a general check of test instrumentation by making not more than 10 stops from a speed of not more than 30 m.p.h. at a deceleration of not more than 10 f.p.s.p.s. If test instrument repair, replacement, or adjustment is necessary, make not more than 10 additional stops after such repair, replacement or adjustment.

57.3 Service brake system—first (preburnished) effectiveness test.

57.3.1 Service brake system. Make six stops from 30 m.p.h. and then six stops from 60 m.p.h. with an initial brake temperature between 130 °F. and 150 °F.

57.3.2 Partial service brake system. For a motorcycle with two independently actuated service brake systems, repeat §571.3.1 using each service brake system individually.

57.4 Service brake system—burnish procedure. Burnish the brakes by making 200 stops from 30 m.p.h. at 12 f.p.s.p.s. The braking interval shall be either the distance necessary to reduce the initial brake temperature to between 130 °F. and 150 °F. or 1 mile, whichever occurs first. Accelerate at maximum rate to 30 m.p.h. immediately after each stop and maintain that speed until making the next stop. After burnishing adjust the brakes in accordance with the manufacturer’s recommendation.

57.5 Service brake system—second effectiveness test. Repeat §571.3.1. Then, make four stops from 80 m.p.h. and four stops from the multiple of 5 m.p.h. that is 4 m.p.h. to 8 m.p.h. less than the speed attainable in 1 mile if that speed is 95 m.p.h. or greater.

57.6 Service brake system—fade and recovery test. These requirements do not apply to a motor-driven cycle whose speed attainable in 1 mile is 30 m.p.h. or less.

57.6.1 Baseline check stops. Make three stops from 30 m.p.h. at 10 to 11 f.p.s.p.s. for each stop. Compute the average of the maximum brake pedal forces and the maximum brake lever forces required for the three stops.

57.6.2 Fade stops. Make 10 stops from 60 m.p.h. at not less than 15 f.p.s.p.s. for each stop. The initial brake temperature before the first brake application shall be between 130 °F. and 150 °F. Initial brake temperatures before brake applications for subsequent stops shall be those occurring at the distance intervals. Attain the required deceleration as quickly as possible and maintain at least this rate for not less than three-fourths of the total stopping distance for each stop. The interval between the starts of service brake applications shall be 0.4 mile. Drive 1 mile at 30 m.p.h. after the last fade stop and immediately conduct the recovery test specified in §571.6.3.

57.6.3 Recovery test. Make five stops from 30 m.p.h. at 10 to 11 f.p.s.p.s. for each stop. The braking interval shall not be more than 1 mile. Immediately after each stop accelerate at maximum rate to 30 m.p.h. and maintain that speed until making the next stop.

57.7 Service brake system—reburnish. Repeat §571.4 except make 35 burnish stops instead of 200 stops. Brakes may be adjusted after reburnish if no tools are used. These requirements do not apply to a motor-driven cycle whose speed attainable in 1 mile is 30 m.p.h. or less.

57.8 Service brake system—final effectiveness test. These requirements do not apply to a motor-driven cycle whose speed attainable in 1 mile is 30 m.p.h. or less.

57.8.1 Service brake system. Repeat §571.5 including §571.3.1.

57.8.2 Partial service brake system test. Alter the service brake system on three-wheeled motorcycles to induce a complete loss of braking in any one subsystem. Determine the line pressure or pedal force necessary to cause the
§571.122  49 CFR Ch. V (10–1–08 Edition)

brake system failure indicator to operate. Make six stops from 30 m.p.h. and then six stops from 60 m.p.h. with an initial brake temperature between 130 °F. and 150 °F. Repeat for each subsystem. Determine that the brake failure indicator is operating when the master cylinder fluid level is less than the level specified in §5.1.3.1(a)(2), and that it complies with §5.1.3.1(c). Check for proper operation with each reservoir in turn at a low level. Restore the service brake system to normal at completion of this test.

S7.9 Parking brake test. Starting with an initial brake temperature of not more than 150 °F., drive the motorcycle downhill on the 30 percent grade with the longitudinal axis of the motorcycle in the direction of the grade. Apply the service brakes with a force not exceeding 90 pounds to stop the motorcycle and place the transmission in neutral. Apply the parking brake by exerting a force not exceeding those specified in §5.6. Release the service brake and allow the motorcycle to remain at rest (to the limit of traction of the braked wheels) for 5 minutes. Repeat the test with the motorcycle parked in the reversed (uphill) position on the grade.

S7.10 Service brake system—water recovery test.

S7.10.1 Baseline check stops. Make three stops from 30 m.p.h. at 10 to 11 f.p.s.p.s. for each stop. Compute the average of the maximum brake pedal forces and of the maximum brake lever forces required for the three stops.

S7.10.2 Wet brake recovery stops. Completely immerse the rear brake assembly of the motorcycle in water for 2 minutes with the brake fully released. Next completely immerse the front brake assembly of the motorcycle in water for 2 minutes with the brake fully released. Perform the entire wetting procedure in not more than 7 minutes. Immediately after removal of the front brake from water, accelerate at a maximum rate to 30 m/h without a brake application. Immediately upon reaching that speed make five stops, each from 30 m/h at 10 to 11 ft/s² for each stop. After each stop (except the last) accelerate the motorcycle immediately at a maximum rate to 30 m/h and begin the next stop.

S7.11 Final inspection. Upon completion of all the tests inspect the brake system in an assembled condition, for compliance with the brake lining inspection requirements. Disassemble all brakes and inspect:

(a) The entire brake system for detachment or fracture of any component.

(b) Brake linings for detachment from the shoe or pad.

(c) Wheel cylinder, master cylinder, and axle seals for fluid or lubricant leakage.

(d) Master cylinder for reservoir capacity and retention device.

(e) Master cylinder label for compliance with §5.1.2.2.

§ 571.123 Motorcycle controls and displays.

S1. Scope. This standard specifies requirements for the location, operation, identification, and illumination of motorcycle controls and displays, and requirements for motorcycle stands and footrests.

S2. Purpose. The purpose of this standard is to minimize accidents caused by operator error in responding to the motoring environment, by standardizing certain motorcycle controls and displays.

S3. Application. This standard applies to motorcycles equipped with handlebars, except for motorcycles that are designed, and sold exclusively for use by law enforcement agencies.

S4. Definitions. Clockwise and counterclockwise mean opposing directions of rotation around the following axes, as applicable.

(a) The operational axis of the ignition control, viewed from in front of the ignition lock opening;
(b) The axis of the right handlebar on which the twist-grip throttle is located, viewed from the end of that handlebar;
(c) The axis perpendicular to the center of the speedometer, viewed from the operator’s normal eye position.

Scooter means a motorcycle that:
(1) Has a platform for the operator’s feet or has integrated footrests, and
(2) Has a step-through architecture, meaning that the part of the vehicle forward of the operator’s seat and between the legs of an operator seated in the riding position, is lower in height than the operator’s seat.

S5. Requirements.

S5.1. Each motorcycle shall be equipped with a supplemental engine stop control, located and operable as specified in Table 1.

S5.2. Each motorcycle to which this standard applies shall meet the following requirements:

S5.2.1 Control location and operation. If an item of equipment listed in Table 1, Column 1, is provided, the control for such item shall be located as specified in Column 2, and operable as specified in Column 3. Each control located on a right handlebar shall be operable by the operator’s right hand throughout its full range without removal of the operator’s right hand from the throttle. Each control located on a left handlebar shall be operable by the operator’s left hand throughout its full range without removal of the operator’s left hand from the handgrip. If a motorcycle with an automatic clutch other than a scooter is equipped with a supplemental rear brake control, the control shall be located on the left handlebar. If a scooter with an automatic clutch is equipped with a supplemental rear brake control, the control shall be on the right side and operable by the operator’s right foot. A supplemental control shall provide brake actuation identical to that provided by the required control of Table 1, Item 11, of this Standard. If a motorcycle is equipped with self-proportioning or antilock braking devices utilizing a single control for front and rear brakes, the control shall be located and operable in the same manner as a rear brake control, as specified in Table 1, Item 11, and in this paragraph.

S5.2.2 Display illumination and operation. If an item of equipment listed in Table 2, Column 1, is provided, the display for such item shall be visible to a seated operator under daylight conditions, shall illuminate as specified in Column 2, and shall operate as specified in Column 3.

S5.2.3 Control and display identification. If an item of equipment in Table 3, Column 1, is provided, the item and its operational function shall be identified by:

(a) A symbol substantially in the form shown in Column 3; or
(b) Wording shown in both Column 2 and Column 4; or
(c) A symbol substantially in the form shown in Column 3 and wording shown in both Column 2 and Column 4.

(d) The abbreviations “M.P.H.”, “km/h”, “r/min”, “Hi”, “Lo”, “L”, “R”, and “Res” appearing in Column 2 and Column 4 may be spelled in full. Symbols and words may be provided for equipment items where none are shown in Column 2, Column 3, and Column 4. Any identification provided shall be placed on or adjacent to the control or display position, and shall appear upright to the operator.

S5.2.4 Stands. A stand shall fold rearward and upward if it contacts the
§ 571.123

584

594

49 CFR Ch. V (10–1–08 Edition)

ground when the motorcycle is moving forward.

S5.2.5 Footrests. Footrests shall be provided for each designated seating position. Each footrests for a passenger other than an operator shall fold rearward and upward when not in use.

^1 Required only if electric starter is separate from ignition switch.
^2 The pair of arrows is a single symbol. When the indicators for left and right turn operate independently, however, the two arrows will be considered separate symbols and may be spaced accordingly.
^3 MPH increase in a clockwise direction. Major graduations and numerals appear at 10 mph intervals, minor graduations at 5 mph intervals. (37 F.R. 17474—August 29, 1972. Effective: 9/1/74)
^4 If the speedometer is graduated in miles per hour (MPH) and in kilometers per hour (km/h), the identifying words or abbreviation shall be "MPH" and "km/h" in any combination of upper or lower case letters.

§ 571.124 Standard No. 124; Accelerator control systems.

S1. Scope. This standard establishes requirements for the return of a vehicle’s throttle to the idle position when the driver removes the actuating force from the accelerator control, or in the event of a severance or disconnection in the accelerator control system.

S2. Purpose. The purpose of this standard is to reduce deaths and injuries resulting from engine overspeed caused by malfunctions in the accelerator control system.

S3. Application. This standard applies to passenger cars, multi-purpose passenger vehicles, trucks, and buses.

S4. Definitions.

S4.1 Driver-operated accelerator control system means all vehicle components, except the fuel metering device, that regulate engine speed in direct response to movement of the driver-operated control and that return the throttle to the idle position upon release of the actuating force.

Fuel metering device means the carburetor, or in the case of certain engines the fuel injector, fuel distributor or fuel injection pump.

Throttle means the component of the fuel metering device that connects to the driver-operated accelerator control system and that by input from the driver-operated accelerator control system controls the engine speed.

Idle position means the position of the throttle at which it first comes in contact with an engine idle speed control appropriate for existing conditions according to the manufacturers’ recommendations. These conditions include, but are not limited to, engine speed adjustments for cold engine, air conditioning, and emission control, and the use of throttle setting devices.

Ambient temperature means the surrounding air temperature, at a distance such that it is not significantly affected by heat from the vehicle under test.

S4.2 In the case of vehicles powered by electric motors, the words throttle and idle refer to the motor speed controller and motor shutdown, respectively.

S5. Requirements. The vehicle shall meet the following requirements when the engine is running under any load condition, and at any ambient temperature between −40 degrees Celsius and +52 degrees Celsius after 12 hours of conditioning at any temperature within that range.

S5.1 There shall be at least two sources of energy capable of returning the throttle to the idle position within the time limit specified by S5.3 from any accelerator position or speed whenever the driver removes the opposing actuating force. In the event of failure of one source of energy by a single severance or disconnection, the throttle shall return to the idle position within the time limits specified by S5.3, from any accelerator position or speed whenever the driver removes the opposing actuating force.

S5.2 The throttle shall return to the idle position from any accelerator position or any speed of which the engine is capable whenever any one component of the accelerator control system is disconnected or severed at a single point. The return to idle shall occur within the time limit specified by S5.3, measured either from the time of severance or disconnection or from the first removal of the opposing actuating force by the driver.

S5.3 Except as provided below, maximum time to return to idle position shall be 1 second for vehicles of 4536 kilograms or less GVWR, and 2 seconds for vehicles of more than 4536 kilograms GVWR. Maximum time to return to idle position shall be 3 seconds for any vehicle that is exposed to ambient air at −18 degrees Celsius to −40 degrees Celsius during the test or for any portion of the 12-hour conditioning period.

[38 FR 2880, Jan. 31, 1973; as amended at 60 FR 13645, Mar. 14, 1995]

§ 571.125 Standard No. 125; Warning devices.

S1. Scope. This standard establishes requirements for devices, without self-contained energy sources, that are designed to be carried in motor vehicles and used to warn approaching traffic of the presence of a stopped vehicle, except for devices designed to be permanently affixed to the vehicle.
§ 571.125  

49 CFR Ch. V (10–1–08 Edition)

S2. **Purpose.** The purpose of this standard is to reduce deaths and injuries due to rear end collisions between moving traffic and disabled vehicles.

S3. **Application.** This standard applies to devices, without self-contained energy sources, that are designed to be carried in buses and trucks that have a gross vehicle weight rating (GVWR) greater than 10,000 pounds. These devices are used to warn approaching traffic of the presence of a stopped vehicle, except for devices designed to be permanently affixed to the vehicle.

S4. **Definitions.** *Entrance angle* means the angle having as its sides the line through the center, and normal to the face, of the object to be tested, and the line from the center of the object to the center of the source of illumination (Figure 2).

*Fluorescent* means the property of emitting visible light due to the absorption of radiation of a shorter wavelength which may be outside the visible spectrum.

*Observation angle* means the angle having as its sides the line from the observation point to the center of the object to be tested and the line from the center of that object to the center of the source of illumination (Figure 2).

*Reflex reflective* means reflective of light in directions close to the direction of incident light, over a wide range of variations in the direction of incident light.

S5. **Requirements.**

S5.1 **Equipment.**

S5.1.1 Reflex reflective material and fluorescent material that meet the requirements of this standard shall be affixed to both faces of the warning device. Alternatively, a dual purpose orange fluorescent and red reflective material that meets the requirements of this standard (hereafter referred to as “dual purpose material”) may be affixed to both faces in places of the reflective and fluorescent materials.

S5.1.2 Each warning device shall be protected from damage and deterioration—

(a) By enclosure in an opaque protective reusable container, except that two or three warning devices intended to be sold for use as a set with a single vehicle may be enclosed in a single container; or

(b) By secure attachment to any light-tight, enclosed, and easily accessible compartment of a new motor vehicle with which it is supplied by the vehicle manufacturer.

S5.1.3 The warning device shall be designed to be erected, and replaced in its container, without the use of tools.

S5.1.4 The warning device shall be permanently and legibly marked with:

(a) Name of manufacturer;

(b) Month and year of manufacture, which may be expressed numerically, as “6/72”; and

(c) The symbol DOT, or the statement that the warning device complies with all applicable Federal motor vehicle safety standards.

S5.1.5 Each warning device shall have instructions for its erection and display.

(a) The instructions shall be either indelibly printed on the warning device or attached in such a manner that they cannot be easily removed.

(b) Instructions for each warning device shall include a recommendation that the driver activate the vehicular hazard warning signal lamps before leaving the vehicle to erect the warning device.

(c) Instructions shall include the illustration depicted in Figure 3 indicating recommended positioning.

S5.2 **Configuration.**

S5.2.1 When the warning device is erected on level ground:

(a) Part of the warning device shall form an equilateral triangle that stands in a plane not more than 10° from the vertical, with the lower edge of the base of the triangle horizontal and not less than 1 inch above the ground.

(b) None of the required portion of the reflective material and fluorescent material shall be obscured by any other part of the warning device except for any portion of the material over which it is necessary to provide fasteners, pivoting beads or other means to allow collapsibility or support of the device. In any event, sufficient reflective and fluorescent material shall be used on the triangle to meet the requirements of S5.4 and S5.5.

S5.2.2 Each of the three sides of the triangular portion of the warning device shall not be less than 17 and not
more than 22 inches long, and not less than 2 and not more than 3 inches wide (Figure 1).

§ 571.125  Each face of the triangular portion of the warning device shall have an outer border of red reflex reflective material of uniform width and not less than 0.75 and not more than 1.75 inches wide, and an inner border of orange fluorescent material of uniform width and not less than 1.25 and not more than 1.30 inches wide (Figure 1). However, this requirement shall not apply if the dual purpose material is used.

§ 5.2.4  Each vertex of the triangular portion of the warning device shall have a radius of not less than 0.25 inch and not more than 0.50 inch.

§ 5.2.5  All edges shall be rounded or chamfered, as necessary, to reduce the possibility of cutting or harm to the user.

§ 5.2.6  The device shall consist entirely of the triangular portion and attachments necessary for its support and enclosure, without additional visible shapes or attachments.

§ 5.3  Color.

§ 5.3.1  The color of the red reflex reflective material on the warning device shall have the following characteristics, both before and after the warning device has been conditioned in accordance with § 6.1, when the source of illumination is a lamp with a tungsten filament operating at 2856 Kelvin color temperature. Expressed in terms of the International Commission on Illumination (CIE) 1931 standard colorimetric observer system (CIE chromaticity diagram, Figure 4), the chromaticity coordinates of the red reflex reflective material shall lie within the region bounded by the spectrum locus and the lines on the diagram defined by the following equations:

<table>
<thead>
<tr>
<th>Boundary</th>
<th>Equations</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yellow</td>
<td>( y = 0.33 )</td>
</tr>
<tr>
<td>White</td>
<td>( xy = 0.93 )</td>
</tr>
</tbody>
</table>

§ 5.3.2  The color of the orange fluorescent material on the warning device shall have the following characteristics, both before and after the warning device has been conditioned in accordance with § 6.1, when the source of illumination is a 150-watt high pressure xenon compact arc lamp. Expressed in terms of the International Commission on Illumination (CIE) 1931 standard colorimetric observer system, the chromaticity coordinates of the orange fluorescent material shall lie within the region bounded by the spectrum locus and the lines on the diagram defined by the following equations:

<table>
<thead>
<tr>
<th>Boundary</th>
<th>Equations</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yellow</td>
<td>( y = 0.49 x + 0.17 )</td>
</tr>
<tr>
<td>White</td>
<td>( xy = 0.93 )</td>
</tr>
<tr>
<td>Red</td>
<td>( y = 0.35 )</td>
</tr>
</tbody>
</table>

The 150-watt high pressure xenon compact arc lamp shall illuminate the sample using the unmodified spectrum at an angle of incidence of 45° and an angle of observation of 90°. If dual purpose material is being tested, it shall be illuminated by a 150-watt high pressure xenon compact arc lamp, whose light is diffused by an integrating sphere.

§ 5.4  Reflectivity. When the red reflex reflective material on the warning device is tested in accordance with § 6.2, both before and after the warning device has been conditioned in accordance with § 6.1, its total candlepower per incident foot candle shall be not less than the values specified in Table I for each of the listed entrance angles.

§ 5.5  Luminance. When the orange fluorescent material on the warning device is tested in accordance with § 6.3, both before and after the warning device has been conditioned in accordance with § 6.1, it shall have a minimum relative luminance of 25 percent of a flat magnesium oxide surface and a minimum product of that relative luminance and width in inches of 44.

§ 5.6  Stability. When the warning device is erected on a horizontal brushed concrete surface both with and against the brush marks and subjected to a horizontal wind of 40 miles per hour in any direction for 3 minutes—

(a) No part of it shall slide more than 3 inches from its initial position;
(b) Its triangular portion shall not tilt to a position that is more than 10° from the vertical; and
(c) Its triangular position shall not turn through a horizontal angle of more than 10° in either direction from the initial position.
§ 571.125  

S5.7 Durability. When the warning device is conditioned in accordance with S6.1, no part of the warning device shall become warped or separated from the rest of the warning device.

S6. Test Procedures.

S6.1 Conditions.

S6.1.1 Submit the warning device to the following conditioning sequence, returning the device after each step in the sequence to ambient air at 68 °F. for at least 2 hours.

(a) Minus 40 °F. for 16 hours in a circulating air chamber using ambient air which would have not less than 30 percent and not more than 70 percent relative humidity at 70 °F.;

(b) 150 °F. for 16 hours in a circulating air oven using ambient air which would have not less than 30 percent and not more than 70 percent relative humidity at 70 °F.;

(c) 100 °F. and 90 percent relative humidity for 16 hours;

(d) Salt spray (fog) test in accordance with American Society of Testing and Materials Standard B-117, Standard Method of Salt Spray (fog) testing, August 1964, except that the test shall be for 4 hours rather than 40 hours; and

(e) Immersion for 2 hours in water at a temperature of 100 °F.

S6.2 Reflectivity Test. Test the red reflex reflective materials as follows:

(a) Unless dual purpose material is used, prevent the orange fluorescent material from affecting the photometric measurement of the reflectivity of the red reflex reflective material, either by separation or masking.

(b) Use a lamp with a tungsten filament operating at 2856° Kelvin color temperature as the source of illumination.

(c) Place the source of illumination 100 feet from the red reflex reflective material (Figure 2).

(d) Place the observation point directly above the source of illumination (Figure 2).

(e) Calculate the total candlepower per incident foot candle of the red reflex reflective material at each of the entrance and observation angles specified in Table 1.

S6.3 Luminance Test. Test the orange fluorescent material as follows:

(a) Unless dual purpose material is used, prevent the red reflex reflective material from affecting the photometric measurement of the luminance of the orange fluorescent material.

(b) Using a 150-watt high pressure xenon compact arc lamp as the light source, illuminate the test sample at an angle of incidence of 45° and an angle of observation of 90°. If dual purpose material is being tested, illuminate the sample diffusely through an integrating sphere.

(c) Measure the luminance of the material at a perpendicular viewing angle, with no ray of the viewing beam more than 5° from the perpendicular to the specimen.

(d) Repeat the procedure for a flat magnesium oxide surface, and compute the quotient (percentage) of the luminance of the material relative to that of the magnesium oxide surface.

TABLE 1
§ 571.126 Standard No. 126; Electronic stability control systems.

S1. Scope. This standard establishes performance and equipment requirements for electronic stability control (ESC) systems.

S2. Purpose. The purpose of this standard is to reduce the number of deaths and injuries that result from crashes in which the driver loses directional control of the vehicle, including those resulting in vehicle rollover.

S3. Application and Incorporation by Reference.

S3.1 Application. This standard applies to passenger cars, multipurpose passenger vehicles, trucks, and buses with a gross vehicle weight rating of
4,536 kilograms (10,000 pounds) or less, according to the phase-in schedule specified in §8 of this standard.

§4. Definitions.

Ackerman Steer Angle means the angle whose tangent is the wheelbase divided by the radius of the turn at a very low speed.

Electronic Stability Control System or ESC System means a system that has all of the following attributes:

(1) That augments vehicle directional stability by applying and adjusting the vehicle brake torques individually to induce a correcting yaw moment to a vehicle;

(2) That is computer controlled with the computer using a closed-loop algorithm to limit vehicle oversteer and to limit vehicle understeer;

(3) That has a means to determine the vehicle’s yaw rate and to estimate its side slip or side slip derivative with respect to time;

(4) That has a means to monitor driver steering inputs;

(5) That has an algorithm to determine the need, and a means to modify engine torque, as necessary, to assist the driver in maintaining control of the vehicle, and

(6) That is operational over the full speed range of the vehicle (except at vehicle speeds less than 15 km/h (9.3 mph) or when being driven in reverse).

Lateral Acceleration means the component of the vector acceleration of a point in the vehicle perpendicular to the vehicle x axis (longitudinal) and parallel to the road plane.

Oversteer means a condition in which the vehicle’s yaw rate is greater than the yaw rate that would occur at the vehicle’s speed as a result of the Ackerman Steer Angle.

Sideslip or side slip angle means the arctangent of the lateral velocity of the center of gravity of the vehicle divided by the longitudinal velocity of the vehicle.

Understeer means a condition in which the vehicle’s yaw rate is less than the yaw rate that would occur at the vehicle’s speed as result of the Ackerman Steer Angle.

Yaw rate means the rate of change of the vehicle’s heading angle measured in degrees/second of rotation about a vertical axis through the vehicle’s center of gravity.

§5. Requirements. Subject to the phase-in set forth in §8, each vehicle must be equipped with an ESC system that meets the requirements specified in §5 under the test conditions specified in §6 and the test procedures specified in §7 of this standard.

§5.1 Required Equipment. Vehicles to which this standard applies must be equipped with an electronic stability control system that:

§5.1.1 Is capable of applying brake torques individually to all four wheels and has a control algorithm that utilizes this capability.

§5.1.2 Is operational during all phases of driving including acceleration, coasting, and deceleration (including braking), except when the driver has disabled ESC, the vehicle speed is below 15 km/h (9.3 mph), or the vehicle is being driven in reverse.

§5.1.3 Remains capable of activation even if the antilock brake system or traction control system is also activated.
§ 571.126

S5.2 Performance Requirements. During each test performed under the test conditions of S6 and the test procedure of S7.9, the vehicle with the ESC system engaged must satisfy the stability criteria of S5.2.1 and S5.2.2, and it must satisfy the responsiveness criterion of S5.2.3 during each of those tests conducted with a commanded steering wheel angle of 5\(^\circ\) or greater, where \(A\) is the steering wheel angle computed in S7.6.1.

S5.2.1 The yaw rate measured one second after completion of the sine with dwell steering input (time \(T_0 + 1\) in Figure 1) must not exceed 35 percent of the first peak value of yaw rate recorded after the steering wheel angle changes sign (between first and second peaks) (\(\dot{\theta}_{\text{peak}}\) in Figure 1) during the same test run, and

S5.2.2 The yaw rate measured 1.75 seconds after completion of the sine with dwell steering input must not exceed 20 percent of the first peak value of yaw rate recorded after the steering wheel angle changes sign (between first and second peaks) during the same test run.

S5.2.3 The lateral displacement of the vehicle center of gravity with respect to its initial straight path must be at least 1.83 m (6 feet) for vehicles with a GVWR of 3,500 kg (7,716 lb) or less, and 1.52 m (5 feet) for vehicles with a GVWR greater than 3,500 kg (7,716 lb) when computed 1.07 seconds after the Beginning of Steer (BOS). BOS is defined in S7.11.6.

S5.2.3.1 The computation of lateral displacement is performed using double integration with respect to time of the measurement of lateral acceleration at the vehicle center of gravity, as expressed by the formula:

\[
\text{Lateral Displacement} = \int \int A_y \, dt
\]

S5.2.3.2 Time \(t = 0\) for the integration operation is the instant of steering initiation, known as the Beginning of Steer (BOS). BOS is defined in S7.11.6.

S5.3 ESC Malfunction. The vehicle must be equipped with a telltale that provides a warning to the driver of the occurrence of one or more malfunctions that affect the generation or transmission of control or response signals in the vehicle’s electronic stability control system. The ESC malfunction telltale:

S5.3.1 As of September 1, 2011, must be mounted inside the occupant compartment in front of and in clear view of the driver;

S5.3.2 As of September 1, 2011, must be identified by the symbol shown for “ESC Malfunction Telltale” or the specified words or abbreviations listed in Table 1 of Standard No. 101 (49 CFR 571.101);

S5.3.3 As of September 1, 2011, except as provided in paragraph S5.3.4, the ESC malfunction telltale must illuminate only when a malfunction(s) exists and must remain continuously illuminated under the conditions specified in S5.3 for as long as the malfunction(s) exists, whenever the ignition locking system is in the “On” (“Run”) position; and

S5.3.4 As of September 1, 2011, except as provided in paragraph S5.3.5, each ESC malfunction telltale must be activated as a check of lamp function either when the ignition locking system is turned to the “On” (“Run”) position when the engine is not running, or when the ignition locking system is in a position between “On” (“Run”) and “Start” that is designated by the manufacturer as a check position.

S5.3.5 The ESC malfunction telltale need not be activated when a starter interlock is in operation.

S5.3.6 The requirement S5.3.4 does not apply to telltales shown in a common space.

S5.3.7 The ESC malfunction telltale must extinguish at the next ignition cycle after the malfunction has been corrected.

S5.3.8 The manufacturer may use the ESC malfunction telltale in a flashing mode to indicate ESC operation.

S5.3.9 Prior to September 1, 2011, a disconnection of the power to the ESC electronic control unit may be indicated by the ABS malfunction telltale instead of the ESC malfunction telltale, and a disconnection of the “ESC Off” control need not illuminate the ESC malfunction telltale.

S5.4. ESC Off and Other System Controls. The manufacturer may include an “ESC Off” control whose only purpose
is to place the ESC system in a mode in which it will no longer satisfy the performance requirements of S5.2.1, S5.2.2 and S5.2.3. Manufacturers may also provide controls for other systems that have an ancillary effect upon ESC operation. Controls of either kind that place the ESC system in a mode in which it will no longer satisfy the performance requirements of S5.2.1, S5.2.2 and S5.2.3 are permitted, provided that:

S5.4.1 The vehicle’s ESC system must always return to a mode that satisfies the requirements of S5.1 and S5.2 at the initiation of each new ignition cycle, regardless of what mode the driver had previously selected except if that mode is specifically for enhanced traction during low-speed, off-road driving and is entered by the driver using a mechanical control that cannot be automatically reset electrically. If the system has more than one mode that satisfies these requirements, the default mode must be the mode that satisfies the performance requirements of S5.2 by the greatest margin.

S5.4.2 As of September 1, 2011, a control whose only purpose is to place the ESC system in a mode in which it will no longer satisfy the performance requirements of S5.2.1, S5.2.2 and S5.2.3 must be identified by the symbol shown for “ESC Off” in Table 1 of Standard No. 101 (49 CFR 571.101) or the text, “ESC Off” as listed under “Word(s) or Abbreviations” in Table 1 of Standard No. 101 (49 CFR 571.101).

S5.4.3 As of September 1, 2011, the “ESC Off” telltale must be mounted inside the occupant compartment in front of and in clear view of the driver.

S5.4.4 The “ESC Off” telltale must remain continuously illuminated for as long as the ESC is in a mode that renders it unable to satisfy the requirements of S5.2.1, S5.2.2 and S5.2.3, and

S5.4.5 Notwithstanding S5.3.1(e) of 49 CFR 571.101, the vehicle manufacturer may use the “ESC Off” telltale to indicate an ESC level of function other than the fully functional default mode even if the vehicle would meet S5.2.1, S5.2.2 and S5.2.3 at that level of ESC function.

S5.4.6 As of September 1, 2011, except as provided in paragraph S5.4.7 and S5.4.8, each “ESC Off” telltale must be activated as a check of lamp function either when the ignition locking system is turned to the “On” (“Run”) position when the engine is not running, or when the ignition locking system is in a position between “On” (“Run”) and “Start” that is designated by the manufacturer as a check position.

S5.4.7 The “ESC Off” telltale need not be activated when a starter interlock is in operation.

S5.4.8 The requirement S5.4.6 does not apply to telltales shown in a common space.

S5.4.9 The “ESC Off” telltale must extinguish after the ESC system has been returned to its fully functional default mode.

S5.6 ESC System Technical Documentation. To ensure a vehicle is equipped with an ESC system that meets the definition of “ESC System” in S4, the vehicle manufacturer must make available to the agency, upon request, the following documentation:

S5.6.1 A system diagram that identifies all ESC system hardware. The diagram must identify what components are used to generate brake torques at each wheel, determine vehicle yaw rate, estimated side slip or the side slip derivative and driver steering inputs.
§ 571.126

A written explanation describing the ESC system basic operational characteristics. This explanation must include a discussion on the system’s capability to apply brake torques at each wheel and how the system modifies engine torque during ESC system activation. The explanation must also identify the vehicle speed range and the driving phases (acceleration, deceleration, coasting, during activation of the ABS or traction control) under which the ESC system can activate.

A logic diagram that supports the explanation provided in §5.6.2.

Specifically for mitigating vehicle understeer, a discussion of the pertinent inputs to the computer or calculations within the computer and how its algorithm uses that information and controls ESC system hardware to limit vehicle understeer.

Test Conditions.

Ambient conditions.

The ambient temperature is between 7 °C (45 °F) and 40 °C (104 °F).

The maximum wind speed is no greater than 10 m/s (22 mph) for passenger cars and 5 m/s (11 mph) for multipurpose passenger vehicles, trucks and buses.

Road test surface.

The tests are conducted on a dry, uniform, solid-paved surface. Surfaces with irregularities and undulations, such as dips and large cracks, are unsuitable.

The road test surface must produce a peak friction coefficient (PFC) of 0.9 when measured using an American Society for Testing and Materials (ASTM) E1136–93 (1993) standard reference test tire, in accordance with ASTM Method E 1337–90 (Reapproved 1996), at a speed of 64.4 km/h (40 mph), without water delivery. (These standards are here incorporated by reference as explained in §3.2 above.)

The test surface has a consistent slope between level and 1%.

Vehicle conditions.

The ESC system is enabled for all testing.

Test Weight. The vehicle is loaded with the fuel tank filled to at least 75 percent of capacity, and total interior load of 168 kg (370 lbs) comprised of the test driver, approximately 59 kg (130 lbs) of test equipment (automated steering machine, data acquisition system and the power supply for the steering machine), and ballast as required by differences in the weight of test drivers and test equipment. Where required, ballast shall be placed on the floor behind the passenger front seat or if necessary in the front passenger foot well area. All ballast shall be secured in a way that prevents it from becoming dislodged during test conduct.

Tires. The vehicle is tested with the tires installed on the vehicle at time of initial vehicle sale. The tires are inflated to the vehicle manufacturer’s recommended cold tire inflation pressure(s) specified on the vehicle’s placard or the tire inflation pressure label. Tubes may be installed to prevent tire de-beading.

Outriggers. Outriggers must be used for testing trucks, multipurpose passenger vehicles, and buses. Vehicles with a baseline weight under 2,722 kg (6,000 lbs) must be equipped with “standard” outriggers and vehicles with a baseline weight equal to or greater than 2,722 kg (6,000 lbs) must be equipped with “heavy” outriggers. A vehicle’s baseline weight is the weight of the vehicle delivered from the dealer, fully fueled, with a 73 kg (160 lb) driver. Standard outriggers shall be designed with a maximum weight of 32 kg (70 lb) and a maximum roll moment of inertia of 35.9 kg-m² (26.5 ft-lb-sec²). Heavy outriggers shall be designed with a maximum weight of 39 kg (86 lb) and a maximum roll moment of inertia of 40.7 kg-m² (30.0 ft-lb-sec²).

Automated steering machine. A steering machine programmed to execute the required steering pattern must be used in §7.5.2, §7.5.3, §7.6 and §7.9. The steering machine shall be capable of supplying steering torques between 40 to 60 Nm (29.5 to 44.3 lb-ft). The steering machine must be able to apply these torques when operating with steering wheel velocities up to 1200 degrees per second.

Test Procedure.

Inflate the vehicles’ tires to the cold tire inflation pressure(s) provided on the vehicle’s placard or the tire inflation pressure label.
S7.2 Telltale bulb check. With the vehicle stationary and the ignition locking system in the “Lock” or “Off” position, activate the ignition locking system to the “On” (“Run”) position or, where applicable, the appropriate position for the lamp check. The ESC malfunction telltale must be activated as a check of lamp function, as specified in S5.3.4, and if equipped, the “ESC Off” telltale must also be activated as a check of lamp function, as specified in S5.5.6. The telltale bulb check is not required for a telltale shown in a common space as specified in S5.3.6 and S5.5.8.

S7.3 “ESC Off” control check. For vehicles equipped with an “ESC Off” control, with the vehicle stationary and the ignition locking system in the “Lock” or “Off” position, activate the ignition locking system to the “On” (“Run”) position. Activate the “ESC Off” control and verify that the “ESC Off” telltale is illuminated, as specified in S5.5.4. Turn the ignition locking system to the “Lock” or “Off” position. Again, activate the ignition locking system to the “On” (“Run”) position and verify that the “ESC Off” telltale has extinguished indicating that the ESC system has been reactivated as specified in S5.4.1.

S7.4 Brake Conditioning. Condition the vehicle brakes as follows:

S7.4.1 Ten stops are performed from a speed of 56 km/h (35 mph), with an average deceleration of approximately 0.5 g.

S7.4.2 Immediately following the series of 56 km/h (35 mph) stops, three additional stops are performed from 72 km/h (45 mph).

S7.4.3 When executing the stops in S7.4.2, sufficient force is applied to the brake pedal to activate the vehicle’s antilock brake system (ABS) for a majority of each braking event.

S7.4.4 Following completion of the final stop in S7.4.2, the vehicle is driven at a speed of 72 km/h (45 mph) for five minutes to cool the brakes.

S7.5 Tire Conditioning. Condition the tires using the following procedure to wear away mold sheen and achieve operating temperature immediately before beginning the test runs of S7.6 and S7.9.

S7.5.1 The test vehicle is driven around a circle 30 meters (100 feet) in diameter at a speed that produces a lateral acceleration of approximately 0.5 to 0.6 g for three clockwise laps followed by three counterclockwise laps.

S7.5.2 Using a sinusoidal steering pattern at a frequency of 1 Hz, a peak steering wheel angle amplitude corresponding to a peak lateral acceleration of 0.5–0.6 g, and a vehicle speed of 56 km/h (35 mph), the vehicle is driven through four passes performing 10 cycles of sinusoidal steering during each pass.

S7.5.3 The steering wheel angle amplitude of the final cycle of the final pass is twice that of the other cycles. The maximum time permitted between all laps and passes is five minutes.

S7.6 Slowly Increasing Steer Test. The vehicle is subjected to two series of runs of the Slowly Increasing Steer Test using a constant vehicle speed of 80 ± 2 km/h (50 ± 1 mph) and a steering pattern that increases by 13.5 degrees per second until a lateral acceleration of approximately 0.5 g is obtained. Three repetitions are performed for each test series. One series uses counterclockwise steering, and the other series uses clockwise steering. The maximum time permitted between each test run is five minutes.

S7.6.1 From the Slowly Increasing Steer tests, the quantity “A” is determined. “A” is the steering wheel angle in degrees that produces a steady state lateral acceleration (corrected using the methods specified in S7.11.3) of 0.3 g for the test vehicle. Utilizing linear regression, A is calculated, to the nearest 0.1 degrees, from each of the six Slowly Increasing Steer tests. The absolute value of the six A’s calculated is averaged and rounded to the nearest 0.1 degrees to produce the final quantity, A, used below.

S7.7 After the quantity A has been determined, without replacing the tires, the tire conditioning procedure described in S7.5 is performed immediately prior to conducting the Sine with Dwell Test of S7.9. Initiation of the first Sine with Dwell test series shall begin within two hours after completion of the Slowly Increasing Steer tests of S7.6.
§ 571.126 49 CFR Ch. V (10–1–08 Edition)

§ 571.126 Check that the ESC system is enabled by ensuring that the ESC malfunction and “ESC Off” (if provided) telltales are not illuminated.

§ 571.8 Sine with Dwell Test of Oversteer Intervention and Responsiveness. The vehicle is subjected to two series of test runs using a steering pattern of a sine wave at 0.7 Hz frequency with a 500 ms delay beginning at the second peak amplitude as shown in Figure 2 (the Sine with Dwell tests). One series uses counterclockwise steering for the first half cycle, and the other series uses clockwise steering for the first half cycle. The vehicle is provided a cool-down period between each test run of 90 seconds to five minutes, with the vehicle stationary.

§ 571.9.1 The steering motion is initiated with the vehicle coasting in high gear at 80 ± 2 km/h (50 ± 1 mph).

§ 571.9.2 In each series of test runs, the steering amplitude is increased from run to run, by 0.5A, provided that no such run will result in a steering amplitude greater than that of the final run specified in §571.9.4.

§ 571.9.3 The steering amplitude for the initial run of each series is 1.5A where A is the steering wheel angle determined in §571.6.1.

§ 571.9.4 The steering amplitude of the final run in each series is the greater of 6.5A or 270 degrees, provided the calculated magnitude of 6.5A is less than or equal to 300 degrees. If any 0.5A increment, up to 6.5A, is greater than 300 degrees, the steering amplitude of the final run shall be 300 degrees.

§ 571.9.5 Upon completion of the two series of test runs, post processing of yaw rate and lateral acceleration data is done as specified in §571.11.

§ 571.10 ESC Malfunction Detection.

§ 571.10.1 Simulate one or more ESC malfunction(s) by disconnecting the power source to any ESC component, or disconnecting any electrical connection between ESC components (with the vehicle power off). When simulating an ESC malfunction, the electrical connections for the telltale lamp(s) are not to be disconnected.

§ 571.10.2 With the vehicle initially stationary and the ignition locking system in the “Lock” or “Off” position, activate the ignition locking system to the “Start” position and start the engine. Place the vehicle in a forward gear and obtain a vehicle speed of 48 ± 8 km/h (30 ± 5 mph). Drive the vehicle for at least two minutes including at least one left and one right turning maneuver. Verify that within two minutes of obtaining this vehicle speed the ESC malfunction indicator illuminates in accordance with §571.3.

§ 571.10.3 Stop the vehicle, deactivate the ignition locking system to the “Off” or “Lock” position. After a five-minute period, activate the vehicle’s ignition locking system to the “Start” position and start the engine. Verify that the ESC malfunction indicator again illuminates to signal a malfunction and remains illuminated as long as the engine is running or until the fault is corrected.

§ 571.10.4 Deactivate the ignition locking system to the “Off” or “Lock” position. Restore the ESC system to normal operation, activate the ignition system to the “Start” position and start the engine. Verify that the telltale has extinguished.

§ 571.11 Post Data Processing—Calculations for Performance Metrics. Yaw rate and lateral displacement measurements and calculations must be processed utilizing the following techniques:

§ 571.11.1 Raw steering wheel angle data is filtered with a 12-pole phaseless Butterworth filter and a cutoff frequency of 10Hz. The filtered data is then zeroed to remove sensor offset utilizing static pretest data.

§ 571.11.2 Raw yaw rate data is filtered with a 12-pole phaseless Butterworth filter and a cutoff frequency of 6Hz. The filtered data is then zeroed to remove sensor offset utilizing static pretest data.

§ 571.11.3 Raw lateral acceleration data is filtered with a 12-pole phaseless Butterworth filter and a cutoff frequency of 6Hz. The filtered data is then zeroed to remove sensor offset utilizing static pretest data.
S7.1.4 Steering wheel velocity is determined by differentiating the filtered steering wheel angle data. The steering wheel velocity data is then filtered with a moving 0.1 second running average filter.

S7.1.5 Lateral acceleration, yaw rate and steering wheel angle data channels are zeroed utilizing a defined “zeroing range.” The methods used to establish the zeroing range are defined in S7.11.5.1 and S7.11.5.2.

S7.11.5.1 Using the steering wheel rate data calculated using the methods described in S7.11.4, the first instant steering wheel rate exceeds 75 deg/sec is identified. From this point, steering wheel rate must remain greater than 75 deg/sec for at least 200 ms. If the second condition is not met, the next instant steering wheel rate exceeds 75 deg/sec is identified and the 200 ms validity check applied. This iterative process continues until both conditions are ultimately satisfied.

S7.11.5.2 The “zeroing range” is defined as the 1.0 second time period prior to the instant the steering wheel rate exceeds 75 deg/sec (i.e., the instant the steering wheel velocity exceeds 75 deg/sec defines the end of the “zeroing range”).

S7.11.6 The Beginning of Steer (BOS) is defined as the first instance filtered and zeroed steering wheel angle data reaches −5 degrees (when the initial steering input is counterclockwise) or +5 degrees (when the initial steering input is clockwise) after time defining the end of the “zeroing range.” The value for time at the BOS is interpolated.

S7.11.7 The Completion of Steer (COS) is defined as the time the steering wheel angle returns to zero at the completion of the Sine with Dwell steering maneuver. The value for time at the zero degree steering wheel angle is interpolated.

S7.11.8 The second peak yaw rate is defined as the first local yaw rate peak produced by the reversal of the steering wheel. The yaw rates at 1.000 and 1.750 seconds after COS are determined by interpolation.

S7.11.9 Determine lateral velocity by integrating corrected, filtered and zeroed lateral acceleration data. Zero lateral velocity at BOS event. Determine lateral displacement by integrating zeroed lateral velocity. Zero lateral displacement at BOS event. Lateral displacement at 1.07 seconds from BOS event is determined by interpolation.

S8. Phase-in schedule.

S8.1 Vehicles manufactured on or after September 1, 2008, and before September 1, 2009. For vehicles manufactured on or after September 1, 2008, and before September 1, 2009, the number of vehicles complying with this standard must not be less than 55 percent of:

(a) The manufacturer’s average annual production of vehicles manufactured on or after September 1, 2005, and before September 1, 2008; or

(b) The manufacturer’s production on or after September 1, 2008, and before September 1, 2009.

S8.2 Vehicles manufactured on or after September 1, 2009, and before September 1, 2010. For vehicles manufactured on or after September 1, 2009, and before September 1, 2010, the number of vehicles complying with this standard must not be less than 75 percent of:

(a) The manufacturer’s average annual production of vehicles manufactured on or after September 1, 2006, and before September 1, 2009; or

(b) The manufacturer’s production on or after September 1, 2009, and before September 1, 2010.

S8.3 Vehicles manufactured on or after September 1, 2010, and before September 1, 2011. For vehicles manufactured on or after September 1, 2010, and before September 1, 2011, the number of vehicles complying with this standard must not be less than 95 percent of:

(a) The manufacturer’s average annual production of vehicles manufactured on or after September 1, 2007, and before September 1, 2010; or

(b) The manufacturer’s production on or after September 1, 2010, and before September 1, 2011.

S8.4 Vehicles manufactured on or after September 1, 2011. All vehicles manufactured on or after September 1, 2011 must comply with this standard.

S8.5 Calculation of complying vehicles.

(a) For purposes of complying with S8.1, a manufacturer may count a vehicle if it is certified as complying with
§ 571.126 49 CFR Ch. V (10–1–08 Edition)

this standard and is manufactured on or after June 5, 2007, but before September 1, 2009.

(b) For purpose of complying with S8.2, a manufacturer may count a vehicle if it:
   (1)(i) Is certified as complying with this standard and is manufactured on or after June 5, 2007, but before September 1, 2010; and
   (ii) Is not counted toward compliance with S8.1; or
   (2) Is manufactured on or after September 1, 2009, but before September 1, 2010.

(c) For purposes of complying with S8.3, a manufacturer may count a vehicle if it:
   (1)(i) Is certified as complying with this standard and is manufactured on or after June 5, 2007, but before September 1, 2011; and
   (ii) Is not counted toward compliance with S8.1 or S8.2; or
   (2) Is manufactured on or after September 1, 2010, but before September 1, 2011.

S8.6 Vehicles produced by more than one manufacturer.

S8.6.1 For the purpose of calculating average annual production of vehicles for each manufacturer and the number of vehicles manufactured by each manufacturer under S8.1 through S8.4, a vehicle produced by more than one manufacturer must be attributed to a single manufacturer as follows, subject to S8.6.2:

(a) A vehicle that is imported must be attributed to the importer.

(b) A vehicle manufactured in the United States by more than one manufacturer, one of which also markets the vehicle, must be attributed to the manufacturer that markets the vehicle.

S8.6.2 A vehicle produced by more than one manufacturer must be attributed to any one of the vehicle’s manufacturers specified by an express written contract, reported to the National Highway Traffic Safety Administration under 49 CFR Part 585, between the manufacturer so specified and the manufacturer to which the vehicle would otherwise be attributed under S8.6.1.

S8.7 Small volume manufacturers.

Vehicles manufactured during any of the three years of the September 1, 2008 through August 31, 2011 phase-in by a manufacturer that produces fewer than 5,000 vehicles for sale in the United States during that year are not subject to the requirements of S8.1, S8.2, S8.3, and S8.5.

S8.8 Final-stage manufacturers and alterers.

Vehicles that are manufactured in two or more stages or that are altered (within the meaning of 49 CFR 567.7) after having previously been certified in accordance with Part 567 of this chapter are not subject to the requirements of S8.1 through S8.5. Instead, all vehicles produced by these manufacturers on or after September 1, 2012 must comply with this standard.
Figure 1. Steering wheel position and yaw velocity information used to assess lateral stability.

Figure 2. Sine with Dwell steering profile.
§ 571.126, NI.

S5.4.3 and S5.4.4, effective Oct. 22, 2008. For the convenience of the user, the added and revised text is set forth as follows:

§ 571.126 Standard No. 126; Electronic stability control systems.

* * * * *

S4. Definitions.

Ackerman Steer Angle means the angle whose tangent is the wheelbase divided by the radius of the turn at a very low speed.

Drive configuration means the driver-selected, or default, condition for distributing power from the engine to the drive wheels (examples include, but are not limited to, 2-wheel drive, front-wheel drive, rear-wheel drive, all-wheel drive, 4-wheel drive high gear with locked differential, and 4-wheel drive low gear).

Electronic stability control system or ESC system means a system that has all of the following attributes:

(1) That augments vehicle directional stability by applying and adjusting the vehicle brake torques individually to induce a correcting yaw moment to a vehicle;

(2) That is computer-controlled with the computer using a closed-loop algorithm to limit vehicle oversteer and to limit vehicle understeer;

(3) That has a means to determine the vehicle’s yaw rate and to estimate its side slip or side slip derivative with respect to time;

(4) That has a means to monitor driver steering inputs;

(5) That has an algorithm to determine the need, and a means to modify engine torque, as necessary, to assist the driver in maintaining control of the vehicle; and

(6) That is operational over the full speed range of the vehicle (except at vehicle speeds less than 20 km/h (12.4 mph), when being driven in reverse, or during system initialization).

Lateral acceleration means the component of the vector acceleration of a point in the vehicle perpendicular to the vehicle’s x-axis (longitudinal) and parallel to the road plane.

Low-range four-wheel drive configuration means a drive configuration that has the effect of locking the drive gears at the front and rear axles together and providing an additional gear reduction between the engine speed and vehicle speed of at least 2.0.

Mode means an ESC performance algorithm, whether driver-selected or not (examples include, but are not limited to, standard (default) mode, performance mode, snow or slippery road mode, or Off mode).

Oversteer means a condition in which the vehicle’s yaw rate is greater than the yaw rate that would occur at the vehicle’s speed as a result of the Ackerman Steer Angle.

Side slip or side slip angle means the arc tangent of the lateral velocity of the center of gravity of the vehicle divided by the longitudinal velocity of the center of gravity.

Understeer means a condition in which the vehicle’s yaw rate is less than the yaw rate that would occur at the vehicle’s speed as a result of the Ackerman Steer Angle.

Yaw rate means the rate of change of the vehicle’s heading angle measured in degrees per second of rotation about a vertical axis through the vehicle’s center of gravity.

* * * * *

S5.1.2 Is operational during all phases of driving including acceleration, coasting, and deceleration (including braking), except when the driver has disabled ESC, the vehicle speed is below 20 km/h (12.4 mph), the vehicle is being driven in reverse, or during system initialization.

* * * * *

S5.3 ESC Malfunction. The vehicle must be equipped with a telltale that provides a warning to the driver of the occurrence of one or more malfunctions that affect the generation or transmission of control or response signals in the vehicle’s electronic stability control system. When tested according to S7.10, the ESC malfunction telltale:

* * * * *

S5.3.3 As of September 1, 2011, except as provided in paragraphs S5.3.4, S5.3.5, S5.3.8, and S5.3.10, the ESC malfunction telltale must illuminate only when a malfunction(s) of the ESC system exists and must remain continuously illuminated under the conditions specified in S5.3 for as long as the malfunction(s) exists (unless the “ESC malfunction” and “ESC Off” telltales are combined in a two-part telltale and the “ESC Off” telltale is illuminated), whenever the ignition locking system is in the “On” (“Run”) position; and

* * * * *

S5.3.9 Prior to September 1, 2011, a disconnection of the power to the ESC electronic control unit may be indicated by the ABS malfunction telltale instead of the ESC malfunction telltale.

S5.3.10 Manufacturers may use the ESC malfunction telltale in a steady-burning mode to indicate malfunctions of ESC-related systems and functions including traction control, trailer stability assist, corner brake control, and other similar functions that use throttle and/or individual wheel torque control to operate and share common components with the ESC system, and may
§ 571.126 NI.

use the ESC malfunction telltale in a flashing mode to indicate operation of these ESC-related systems.

S5.4 ESC Off and Other System Controls. The manufacturers may include an “ESC Off” control whose only purpose is to place the ESC system in a mode or modes in which it will no longer satisfy the performance requirements of S5.2.1, S5.2.2, and S5.2.3. An “ESC Off” control may be combined with other controls in a multi-function control. Manufacturers may also provide controls for other systems that have an ancillary effect upon ESC operation. Controls of either kind that place the ESC system in a mode in which it will no longer satisfy the performance requirements of S5.2.1, S5.2.2, and S5.2.3 are permitted, provided that:

S5.4.1 The vehicle’s ESC system must always return to the manufacturer’s original default ESC mode that satisfies the requirements of S5.1 and S5.2 at the initiation of each new ignition cycle, regardless of what ESC mode the driver had previously selected, unless (a) the vehicle is in a low-range four-wheel drive configuration selected by the driver on the previous ignition cycle that is designed for low-speed, off-road driving, or (b) the vehicle is in a four-wheel drive configuration selected by the driver on the previous ignition cycle that is designed for operation at higher speeds on snow, sand-, or dirt-packed roads and that has the effect of locking the drive gears at the front and rear axles together, provided that the vehicle meets the stability performance requirements of S5.2.1 and S5.2.2 in this mode.

S5.4.2 In addition to the requirements of S5.4.1, if the vehicle’s ESC system has more than one ESC mode that satisfies the requirements of S5.1 and S5.2 within the drive configuration selected for the previous ignition cycle, the system must return to the manufacturer’s original default ESC mode.

S5.4.3 As of September 1, 2011, a control whose only purpose is to place the ESC system in a mode or modes in which it will no longer satisfy the performance requirements of S5.2.1, S5.2.2, and S5.2.3 must be identified by the symbol shown for “ESC Off” in Table 1 of Standard No. 101 (49 CFR 571.101). See the text, “ESC Off” as listed under “Word(s) or Abbreviations” in Table 1 of Standard No. 101 (49 CFR 571.101).

S5.4.4 A control for another system that has the ancillary effect of placing the ESC system in a mode in which it no longer satisfies the performance requirements of S5.2.1, S5.2.2, and S5.2.3 need not be identified by the “ESC Off” identifiers in Table 1 of Standard No. 101 (49 CFR 571.101), but the ESC status must be identified by the “ESC Off” telltale in accordance with S5.5, as of September 1, 2011, except if the vehicle is in a 4-wheel drive high gear configuration that has the effect of locking the drive gears at the front and rear axles together provided the vehicle meets the stability performance criteria of S5.2.1 and S5.2.2.

S5.5.1 Except as provided in S5.5.10, the vehicle manufacturer must provide a telltale indicating that the vehicle has been put into a mode that renders it unable to satisfy the requirements of S5.2.1, S5.2.2 and S5.2.3, if such a mode is provided.

S5.5.4 Except as provided in paragraph S5.4.4, the “ESC Off” telltale must remain continuously illuminated for as long as the ESC is in a mode that renders it unable to satisfy the requirements of S5.2.1, S5.2.2, and S5.2.3, and

S5.5.10 The “ESC Off” telltale need not illuminate when the vehicle is in a 4-wheel drive high gear locked differential configuration that has the effect of locking the drive gears at the front and rear axles together provided the vehicle meets the stability performance requirements of S5.2.1 and S5.2.2.

S6.3.1 The ESC system is enabled for all testing, except when it is turned off directly or by simulating a malfunction in accordance with S7.3 and S7.10, respectively. The ESC system shall be initialized as follows: Place the vehicle in a forward gear and obtain a vehicle speed of 48 ± 8 km/h (30 ± 5 mph). Drive the vehicle for at least two minutes including at least one left and one right turning maneuver and at least one application of the service brake.

S7.10.2 With the vehicle initially stationary and the ignition locking system in the “Lock” or “Off” position, activate the ignition locking system to the “Start” position and start the engine. Place the vehicle in a forward gear and obtain a vehicle speed of 48 ± 8 km/h (30 ± 5 mph). Drive the vehicle for at least two minutes including at least one left and one right turning maneuver and at least one application of the service brake. Verify that within two minutes after obtaining this vehicle speed the ESC malfunction indicator illuminates in accordance with S5.3.

S7.10.3 As of September 1, 2011, stop the vehicle, deactivate the ignition locking system to the “Off” or “Lock” position. After a five-minute period, activate the vehicle’s ignition locking system to the “Start” position and start the engine. Verify that the
ESC malfunction indicator again illuminates to signal a malfunction and remains illuminated as long as the engine is running or until the fault is corrected.

§ 571.128 Deactivate the ignition locking system to the “Off” or “Lock” position. Restore the ESC system to normal operation, activate the ignition system to the “Start” position and start the engine. Place the vehicle in a forward gear and obtain a vehicle speed of 48 ± 8 km/h (30 ± 5 mph). Drive the vehicle for at least two minutes including at least one left and one right turning maneuver and at least one application of the service brake. Verify that within two minutes after obtaining this vehicle speed that the ESC malfunction indicator has extinguished.

§§ 571.127–571.128 [Reserved]

§ 571.129 Standard No. 129; New non-pneumatic tires for passenger cars.

S1 Scope. This standard specifies tire dimensions and laboratory test requirements for lateral strength, strength, endurance, and high speed performance; defines the tire load rating; and specifies labeling requirements for non-pneumatic spare tires.

S2 Application. This standard applies to new temporary spare non-pneumatic tires for use on passenger cars.

S3 Definitions.

Carcass means the tire structure except for the tread which provides the major portion of the tire’s capability to deflect in response to the vertical loads and tractive forces that the tire transmits from the roadway to the non-pneumatic rim, the wheel center member, or the vehicle and which attaches to the vehicle or attaches, either integrally or separably, to the wheel center member or non-pneumatic rim.

Carcass separation means the pulling away of the carcass from the non-pneumatic rim or wheel center member.

Chunking means the breaking away of pieces of the carcass or tread.

Cracking means any parting within the carcass, tread, or any components that connect the tire to the non-pneumatic rim or wheel center member and, if the non-pneumatic tire is integral with the non-pneumatic rim or wheel center member, any parting within the non-pneumatic rim, or wheel center member.

Load rating means the maximum load a tire is rated to carry.

Maximum tire width means the greater of either the linear distance between the exterior edges of the carcass or the linear distance between the exterior edges of the tread, both being measured parallel to the rolling axis of the tire.

Non-pneumatic rim means a mechanical device which, when a non-pneumatic tire assembly incorporates a wheel, supports the tire, and attaches, either integrally or separably, to the wheel center member and upon which the tire is attached.

Non-pneumatic test rim means with reference to a tire to be tested, any non-pneumatic rim that is listed as appropriate for use with that tire in accordance with §4.4.

Non-pneumatic tire means a mechanical device which transmits, either directly or through a wheel or wheel center member, the vertical load and tractive forces from the roadway to the vehicle, generates the tractive forces that provide the directional control of the vehicle and does not rely on the containment of any gas or fluid for providing those functions.

Non-pneumatic tire assembly means a non-pneumatic tire, alone or in combination with a wheel or wheel center member, which can be mounted on a vehicle.

Non-pneumatic tire identification code means an alphanumeric code that is assigned by the manufacturer to identify the tire with regard to its size, application to a specific non-pneumatic rim or wheel center member or application to a specific vehicle.

Test wheel center member means with reference to a tire to be tested, any wheel center member that is listed as appropriate for use with that tire in accordance with §4.4.

Tread means that portion of the tire that comes in contact with the road.

Tread separation means pulling away of the tread from the carcass.

Wheel means a mechanical device which consists of a non-pneumatic rim and wheel center member and which, in the case of a non-pneumatic tire assembly incorporating a wheel, provides the connection between the tire and the vehicle.
Wheel center member means, in the case of a non-pneumatic tire assembly incorporating a wheel, a mechanical device which attaches, either integrally or separably, to the non-pneumatic rim and the vehicle; or in the case of a non-pneumatic tire assembly not incorporating a wheel, a mechanical device which attaches, either integrally or separably, to the non-pneumatic rim and provides the connection between the non-pneumatic tire and the vehicle.

§ 571.129 Requirements.

S 4.1 Size and Construction. Each tire shall be designed to fit each non-pneumatic rim or wheel center member specified for its non-pneumatic tire identification code designation in a listing in accordance with section 5.4.

S 4.2 Performance Requirements

S 4.2.1 General. Each tire shall conform to the following:

(a) Its load rating shall be that specified in a submission made by a manufacturer, pursuant to S 4.4(a), or in one of the publications described in S 4.4(b) for its non-pneumatic tire identification code designation.

(b) It shall incorporate a tread wear indicator that will provide a visual indication that the tire has worn to a tread depth of \( \frac{1}{16} \) inch.

(c) It shall, before being subjected to either the endurance test procedure specified in S 5.4 or the high speed performance procedure specified in S 5.5, exhibit no visual evidence of tread or carcass separation, cracking or chunking.

(d) It shall meet the requirements of S 4.2.2.5 and S 4.2.2.6 when tested on a test wheel described in S 5.4.2.1 either alone or simultaneously with up to 5 tires.

S 4.2.2 Test Requirements.

S 4.2.2.1 Test Sample. For each test sample use:

(a) One tire for physical dimensions, lateral strength, and strength in sequence;

(b) A second tire for tire endurance; and

(c) A third tire for high speed performance.

S 4.2.2.2 Physical Dimensions. For a non-pneumatic tire assembly in which the tire is separable from the non-pneumatic rim or wheel center member, the dimensions, measured in accordance with S 5.1, for that portion of the tire that attaches to that non-pneumatic rim or wheel center member shall satisfy the dimensional specifications contained in the submission made by an individual manufacturer, pursuant to S 4.4(a), or in one of the publications described in S 4.4(b) for that tire’s non-pneumatic tire identification code designation.

S 4.2.2.3 Lateral Strength. There shall be no visual evidence of tread or carcass separation, cracking or chunking, when a tire is tested in accordance with S 5.2 to a load of:

(a) 1,500 pounds for tires with a load rating less than 880 pounds;

(b) 2,000 pounds for tires with a load rating of 880 pounds or more but less than 1,400 pounds;

(c) 2,500 pounds for tires with a load rating of 1,400 pounds or more, using the load rating marked on the tire or tire assembly.

S 4.2.2.4 Tire Endurance. When the tire has been subjected to the laboratory endurance test specified in S 5.4, using, if applicable, a non-pneumatic test rim or test wheel center member that undergoes no permanent deformation, there shall be no visual evidence of tread or carcass separation, cracking or chunking. In the case of a non-pneumatic tire assembly in which the non-pneumatic tire is an integral part of the assembly, the assembly shall undergo no permanent deformation with the exception of wear of the tread.

S 4.2.2.5 Tire Endurance. When the tire has been subjected to the laboratory endurance test specified in S 5.4, using, if applicable, a non-pneumatic test rim or test wheel center member that undergoes no permanent deformation, there shall be no visual evidence of tread or carcass separation, cracking or chunking. In the case of a non-pneumatic tire assembly in which the non-pneumatic tire is an integral part of the assembly, the assembly shall undergo no permanent deformation with the exception of wear of the tread.

S 4.2.2.6 High Speed Performance. When the tire has been subjected to the laboratory high speed performance test specified in S 5.5, using, if applicable, a non-pneumatic test rim or test wheel center member that undergoes no permanent deformation, there shall be no visual evidence of tread or carcass separation, cracking or chunking. In the
case of a non-pneumatic tire assembly in which the non-pneumatic tire is an integral part of the assembly, the assembly shall undergo no permanent deformation with the exception of wear of the tread.

S4.3 Labeling requirements. Each new non-pneumatic tire shall comply, according to the phase-in schedule specified in S7 of this standard, with the requirements of S5.5 and S5.5.1 of § 571.139.

S4.4 Non-Pneumatic Tire Identification Code and Non-Pneumatic Rim/Wheel Center Member Matching Information. For purposes of this standard, S8 of 49 CFR 571.110 and S10 of 49 CFR 571.120, each manufacturer of a non-pneumatic tire that is not an integral part of a non-pneumatic tire assembly shall ensure that it provides a listing to the public for each non-pneumatic tire that it produces. The listing shall include the non-pneumatic tire identification code, tire load rating, dimensional specifications and a diagram of the portion of the tire that attaches to the non-pneumatic rim or wheel center member, and a list of the non-pneumatic rims or wheel center members that may be used with that tire. For each non-pneumatic rim or wheel center member included in such a listing, the information provided shall include a size and type designation for the non-pneumatic rim or wheel center member, and dimensional specifications and a diagram of the non-pneumatic rim or portion of the wheel center member that attaches to the tire. A listing compiled in accordance with paragraph (a) of this section need not include dimensional specifications or a diagram of the non-pneumatic rim or portion of the wheel center member that attaches to the tire if the non-pneumatic rim’s or portion of the wheel center member’s dimensional specifications and diagram are contained in each listing published in accordance with paragraph (b) of this section. The listing shall be in one of the following forms:

(a) Listed by manufacturer name or brand name in a document furnished to dealers of the manufacturer’s tires or, in the case of non-pneumatic tires supplied only as a temporary spare tire on a vehicle, in a document furnished to dealers of vehicles equipped with the tires, to any person upon request, and in duplicate to the Office of Vehicle Safety Standards, Crash Avoidance Division, National Highway Traffic Safety Administration, U.S. Department of Transportation, Washington, DC 20590; or

(b) Contained in publications, current at the date of manufacture of the tire or any later date, of at least one of the following organizations:

The Tire and Rim Association
The European Tyre and Rim Technical Organization
Japan Automobile Tire Manufacturers’ Association, Inc.
Deutsche Industrie Norm
British Standards Institute
Scandinavian Tire and Rim Organization
Tyre and Rim Association of Australia

S5. Test Procedures.

S5.1 Physical Dimensions. After conditioning the tire at room temperature for at least 24 hours, using equipment with minimum measurement capabilities of one-half the smallest tolerance specified in the listing contained in the submission made by a manufacturer pursuant to §4.4(a), or in one of the publications described in §4.4(b) for that tire’s non-pneumatic tire identification code designation, measure the portion of the tire that attaches to the non-pneumatic rim or wheel center member, and a list of the non-pneumatic rims or wheel center members that may be used with that tire. For each non-pneumatic rim or wheel center member included in such a listing, the information provided shall include a size and type designation for the non-pneumatic rim or wheel center member, and dimensional specifications and a diagram of the non-pneumatic rim or portion of the wheel center member that attaches to the tire. A listing compiled in accordance with paragraph (a) of this section need not include dimensional specifications or a diagram of the non-pneumatic rim or portion of the wheel center member that attaches to the tire if the non-pneumatic rim’s or portion of the wheel center member’s dimensional specifications and diagram are contained in each listing published in accordance with paragraph (b) of this section. The listing shall be in one of the following forms:

(a) Listed by manufacturer name or brand name in a document furnished to dealers of the manufacturer’s tires or, in the case of non-pneumatic tires supplied only as a temporary spare tire on a vehicle, in a document furnished to dealers of vehicles equipped with the tires, to any person upon request, and in duplicate to the Office of Vehicle Safety Standards, Crash Avoidance Division, National Highway Traffic Safety Administration, U.S. Department of Transportation, Washington, DC 20590; or

(b) Contained in publications, current at the date of manufacture of the tire or any later date, of at least one of the following organizations:

The Tire and Rim Association
The European Tyre and Rim Technical Organization
Japan Automobile Tire Manufacturers’ Association, Inc.
Deutsche Industrie Norm
British Standards Institute
Scandinavian Tire and Rim Organization
Tyre and Rim Association of Australia

S5.2 Lateral Strength.

S5.2.1 Preparation of the tire.

S5.2.1.1 If applicable, mount a new tire on a non-pneumatic test rim or test wheel center member.

S5.2.1.2 Mount the tire assembly in a fixture as shown in Figure 1 with the surface of the tire assembly that would face outward when mounted on a vehicle facing toward the lateral strength test block shown in Figure 2 and force...
§ 571.129

the lateral strength test block against the tire.

S5.2.2 Test Procedure.
S5.2.2.1 Apply a load through the block to the tire at a rate of 2 inches per minute, with the load arm parallel to the tire assembly at the time of engagement and the first point of contact with the test block being the test block centerline shown in Figure 2, at the following distances, B, in sequence, as shown in Figure 1:

B=A—1 inch
B=A—2 inches
B=A—3 inches
B=A—4 inches
B=A—5 inches, and
B=A—6 inches.

However, if at any time during the conduct of the test, the test block comes in contact with the non-pneumatic test rim or test wheel center member, the test shall be suspended and no further testing at smaller values of the distance B shall be conducted. When tested to the above procedure, satisfying the requirements of S4.2.2.3 for all values of B greater than that for which contact between the non-pneumatic test rim or test wheel center member and the test block is made, shall constitute compliance to the requirements set forth in S4.2.2.3.

S5.3 Tire Strength.
S5.3.1 Preparation of the Tire.
S5.3.1.1 If applicable, mount the tire on a non-pneumatic test rim or test wheel center member.

S5.3.1.2 Condition the tire assembly at room temperature for at least three hours.

S5.3.2 Test Procedures.
S5.3.2.1 Force the test cleat, as defined in S5.3.2.2, with its length axis (see S5.3.2.2(a)) parallel to the rolling axis of the non-pneumatic tire assembly, and its height axis (see S5.3.2.2(c)), coinciding with a radius of the non-pneumatic tire assembly, into the tread of the tire at five test points equally spaced around the circumference of the tire. At each test point, the test cleat is forced into the tire at a rate of two inches per minute until the applicable minimum energy level, as shown in S4.2.2.4, calculated using the formula contained in S5.3.2.3, is reached.

S5.3.2.2 The test cleat is made of steel and has the following dimensions:
(a) Minimum length of one inch greater than the maximum tire width of the tire,
(b) Width of one-half inch with the surface which contacts the tire’s tread having one-quarter inch radius, and
(c) Minimum height of one inch greater than the difference between the unloaded radius of the non-pneumatic tire assembly and the maximum radius of the non-pneumatic rim or wheel center member, if used with the non-pneumatic tire assembly being tested.

S5.3.2.3 The energy level is calculated by the following formula:

\[ E = \frac{F \times P}{2} \]

where
E=Energy level, inch-pounds;
F=Force, pounds; and
P=Penetration, inches.

S5.4 Tire Endurance.
S5.4.1 Preparation of the Tire.
S5.4.1.1 If applicable, mount a new tire on a non-pneumatic test rim or test wheel center member.

S5.4.1.2 Condition the tire assembly to 100 ± 5 °F, for at least three hours.

S5.4.2 Test Procedure.
S5.4.2.1 Mount the tire assembly on a test axle and press it against a flat-faced steel test wheel 67.23 inches in diameter and at least as wide as the maximum tire width of the tire to be tested or an approved equivalent test wheel, with the applicable test load specified in the table in S5.4.2.3 for the tire’s non-pneumatic tire identification code designation.

S5.4.2.2 During the test, the air surrounding the test area shall be 100 ± 5 °F.

S5.4.2.3 Conduct the test at 50 miles per hour (m.p.h.) in accordance with the following schedule without interruption: The loads for the following periods are the specified percentage of the load rating marked on the tire or tire assembly:

<table>
<thead>
<tr>
<th>Percent</th>
<th>4 hours</th>
<th>8 hours</th>
<th>24 hours</th>
</tr>

S5.4.2.4 Immediately after running the tire the required time, allow the
§ 571.129  
49 CFR Ch. V (10–1–08 Edition)

tire to cool for one hour, then, if applicable, detach it from the non-pneumatic test rim or test wheel center member, and inspect it for the conditions specified in §4.2.2.5.

S5.5  High Speed Endurance.

S5.5.1 After preparing the tire in accordance with §5.4.1, if applicable, mount the tire assembly in accordance with §5.4.2.1, and press it against the test wheel with a load of 88 percent of the tire’s load rating as marked on the tire or tire assembly.

S5.5.2 Break in the tire by running it for 2 hours at 50 m.p.h.

S5.5.3 Allow to cool to 100 ± 5 °F.

S5.5.4 Test at 75 m.p.h. for 30 minutes, 80 m.p.h. for 30 minutes and 85 m.p.h. for 30 minutes.

S5.5.5 Immediately after running the tire for the required time, allow the tire to cool for one hour, then, if applicable, detach it from the non-pneumatic test rim or test wheel center member, and inspect it for the conditions specified in §4.2.2.6.

S6. Nonconforming tires. Any non-pneumatic tire that is designed for use on passenger cars that does not conform to all the requirements of this standard, shall not be sold, offered for sale, introduced or delivered for introduction into interstate commerce, or imported into the United States, for any purpose.

S7 Phase-In Schedule for labeling requirements.

S7.1 Tires manufactured on or after September 1, 2005 and before September 1, 2006. For tires manufactured on or after September 1, 2005 and before September 1, 2006, the number of tires complying with §4.3 of this standard must be equal to not less than 40% of the manufacturer’s production during that period.

S7.2 Tires manufactured on or after September 1, 2006 and before September 1, 2007. For tires manufactured on or after September 1, 2006 and before September 1, 2007, the number of tires complying with §4.3 of this standard must be equal to not less than 70% of the manufacturer’s production during that period.

S7.3 Tires manufactured on or after September 1, 2007. Each tire must comply with §6.3 of this standard.

§ 571.131 Standard No. 131; School bus pedestrian safety devices.

S1. Scope. This standard establishes requirements for devices that can be installed on school buses to improve the safety of pedestrians in the vicinity of stopped school buses.

S2. Purpose. The purpose of this standard is to reduce deaths and injuries by minimizing the likelihood of vehicles passing a stopped school bus and striking pedestrians in the vicinity of the bus.

S3. Application. This standard applies to school buses other than multi-function school activity buses.

S4. Definitions.

Stop signal arm means a device that can be extended outward from the side of a school bus to provide a signal to other motorists not to pass the bus because it has stopped to load or discharge passengers.

S5. Requirements. Each school bus shall be equipped with a stop signal arm meeting the requirements of S5.1 through S5.5 as depicted in Figure 1.

S5.1 The stop signal arm shall be a regular octagon which is at least 450 mm × 450 mm (17.72 inches × 17.72 inches) in diameter.

S5.2 The stop signal arm shall be red on both sides, except as provided in S5.2.1 and S5.2.2, and S5.2.3.

S5.2.1 The stop signal arm shall have a white border at least 12 mm (0.47 inches) wide on both sides, except as provided in S5.2.3. Mounting brackets, clips, bolts, or other components necessary to the mechanical or electrical operation of the stop signal arm may not obscure more than 15 percent of the border on each side of the stop arm. The portion of the border that may be obscured is in addition to that portion which may be obscured by the two red lamps specified in S5.3.2.

S5.2.2 The stop signal arm shall have the word “STOP” displayed in white upper-case letters on both sides, except as provided in S5.2.3. The letters shall be at least 150 mm (5.9 inches) in height. The letters shall have a stroke width of at least 20 mm (0.79 inches), except as provided in S.5.3.1.1.
§ 571.131

S5.2.3 When two stop signal arms are installed on a school bus, the rearmost stop signal arm shall not contain any lettering, symbols, or markings on the forward side.

S5.3 Conspicuity. The stop signal arm shall comply with either S5.3.1 or S5.3.2, or both.

S5.3.1 Except as provided in S5.3.1.1, S5.3.1.2, or S5.3.1.3, the entire surface of both sides of each stop signal arm shall be reflectorized with Type III retroreflective material that meets the minimum specific intensity requirements of S6.1 and Table 1.

S5.3.1.1 The legend of the retroreflective stop arm may be illuminated in a manner such that light is emitted from the surface of each letter or from the area immediately surrounding each letter. Only red lamps may be used. They shall form the complete shape of each letter of the legend, and shall be affixed to all letters (or to the areas immediately surrounding all letters) in the legend. The shape of each letter shall remain constant and, if the lamps are contained within each letter, the net stroke width (stroke width minus the width of the lamp(s)) of each letter of the legend, specified in S5.2.2, shall not be less than 15 mm (0.59 inch). When the stop arm is extended, the lamps shall flash at the rate specified in S6.2.2, with a current “on” time specified in S6.2.2.1. All lamps shall be positioned in one of the two following ways:

1. centered within the stroke of each letter of the legend, or
2. outlining each letter of the legend.

S5.3.1.2 Nonreflectorized mounting brackets, clips, bolts, or other components necessary to the mechanical or electrical operation of the stop signal arm shall not obscure more than 7.5 percent of the total surface area of either side of the stop signal arm.

S5.3.1.3 When two stop signal arms are installed on a school bus, the forward side of the rearmost stop signal arm shall not be reflectorized.

S5.3.2 Each side of the stop signal arm shall have at least two red lamps that meet the requirements of S6.2. The lamps shall be centered on the vertical centerline of the stop arm. One of the lamps shall be located at the extreme top of the stop arm and the other at its extreme bottom.

S5.4 The stop signal arm shall be installed on the left side of the bus.

S5.4.1 The stop signal arm shall be located such that, when in the extended position:

1. The stop signal arm is perpendicular to the side of the bus, plus or minus five degrees;
2. The top edge of the stop signal arm is parallel to and not more than 6 inches from a horizontal plane tangent to the lower edge of the frame of the passenger window immediately behind the driver’s window; and
3. The vertical centerline of the stop signal arm is not less than 9 inches away from the side of the school bus.

S5.4.2 A second stop signal arm may be installed on a school bus. That stop signal arm shall comply with S5.4 and S5.4.1.

S5.5 The stop signal arm shall be automatically extended in such a manner that it complies with S5.4.1, at a minimum whenever the red signal lamps required by S5.1.4 of Standard No. 108 are activated; except that a device may be installed that prevents the automatic extension of a stop signal arm. The mechanism for activating the device shall be within the reach of the driver. While the device is activated, a continuous or intermittent signal audible to the driver shall sound. The audible signal may be equipped with a timing device requiring the signal to sound for at least 60 seconds. If a timing device is used, it shall automatically recycle every time the service entry door is opened while the engine is running and the manual override is engaged.

S6 Test Procedures.

S6.1 Reflectivity Test. When tested under the conditions specified in S6.2 (b), (c), and (d) of Federal motor vehicle safety standard 125, Warning Devices, (49 CFR 571.125), the retroreflective materials shall meet the criteria specified in table 1.
TABLE 1—MINIMUM SPECIFIC INTENSITY PER UNIT AREA (SIA)

S6.2 Lighting Tests.

S6.2.1 Color. The procedure shall be done in accordance with the Society of Automotive Engineers (SAE) J578, Color Specification (May 1988), 1990 SAE Handbook, Society of Automotive Engineers, Inc. Along with the incorporation by reference in S6.2.3, this incorporation by reference was approved by the Director of the Federal Register in accordance with 5 U.S.C. 552(a) and 1 CFR part 51. Copies may be obtained from the Society of Automotive Engineers, 400 Commonwealth Drive, Warrendale, PA 15096-0001. Copies may be inspected at Docket Room, National Highway Traffic Safety Administration, 400 Seventh Street, SW., Washington, DC 20590 or at the National Archives and Records Administration (NARA). For information on the availability of this material at NARA, call 202-741-6030, or go to: http://www.archives.gov/federal_register/code_of_federal_regulations/ibr_locations.html. When visually compared to the light emitted from a filter/source with a combination of chromaticity coordinates as explained in SAE J578, Color Specification (May 1988), within specific boundaries \[y=0.33 \text{ (yellow boundary)} \text{ and } y=0.98-\alpha \text{(purple boundary)}\] the color of light emitted from the test object shall not be less saturated (paler), yellower, or purpler. The test object shall be placed perpendicular to the light source to simulate lamps on stop signal arms. In making visual comparisons, the light from the test object shall light one portion of a comparison field and the light from the filter/source shall light an adjacent area. To make a valid visual comparison, the two fields to be viewed shall be of near equal luminance.

S6.2.2. Flash rate. The lamps on each side of the stop signal arm, when operated at the manufacturer’s design load, shall flash alternately at a rate of 60 to 120 flashes per minute.

S6.2.2.1 Lamps, except those subject to S6.2.2.2, shall have a current “on” time of 30 to 75 percent of the total flash cycle. The total current “on” time for the two terminals shall be between 90 and 110 percent of the total flash cycle.

S6.2.2.2 Xenon short-arc gaseous discharge lamps shall have an “off” time before each flash of at least 50 percent of the total flash cycle.

§ 571.135 Standard No. 135; Light vehicle brake systems.

S1. Scope. This standard specifies requirements for service brake and associated parking brake systems.

S2. Purpose. The purpose of this standard is to ensure safe braking performance under normal and emergency driving conditions.

S3. Application. This standard applies to passenger cars manufactured on or after September 1, 2000 and to multi-purpose passenger vehicles, trucks and buses with a gross vehicle
weight rating (GVWR) of 3,500 kilograms (7,716 pounds) or less, manufactured on or after September 1, 2002. In addition, at the option of the manufacturer, passenger cars manufactured before September 1, 2000, and multi-purpose passenger vehicles, trucks and buses with a GVWR of 3,500 kilograms (7,716 pounds) or less, manufactured before September 1, 2002, may meet the requirements of this standard instead of Federal Motor Vehicle No. 105, Hydraulic Brake Systems.

§571.135 Brake power assist unit means a device installed in a hydraulic brake system that reduces the amount of muscular force that a driver must apply to actuate the system, and that, if inoperative, does not prevent the driver from braking the vehicle by a continued application of muscular force on the service brake control.

§571.135 Brake power unit means a device installed in a brake system that provides the energy required to actuate the brakes, either directly or indirectly through an auxiliary device, with driver action consisting only of modulating the energy application level.

§571.135 Braking ratio means the deceleration of the vehicle divided by the gravitational acceleration constant.

§571.135 Electric vehicle or EV means a motor vehicle that is powered by an electric motor drawing current from rechargeable storage batteries, fuel cells, or other portable sources of electrical current, and which may include a non-electrical source of power designed to charge batteries and components thereof.

§571.135 Electrically-actuated service brakes means service brakes that utilize electrical energy to actuate the foundation brakes.

§571.135 Functional failure means a failure of a component (either electrical or mechanical in nature) which renders the system totally or partially inoperative yet the structural integrity of the system is maintained.

§571.135 Hydraulic brake system means a system that uses hydraulic fluid as a medium for transmitting force from a service brake control to the service brake and that may incorporate a brake power assist unit, or a brake power unit.

§571.135 Initial brake temperature or IBT means the average temperature of the service brakes on the hottest axle of the vehicle 0.32 km (0.2 miles) before any brake application.

§571.135 Lightly loaded vehicle weight or LLVW means unloaded vehicle weight plus the weight of a mass of 180 kg (396 pounds), including driver and instrumentation.

§571.135 Maximum speed of a vehicle or VMax means the highest speed attainable by accelerating at a maximum rate from a standing start for a distance of 3.2 km (2 miles) on a level surface, with the
vehicle at its lightly loaded vehicle weight, and, if an EV, with the propulsion batteries at a state of charge of not less than 95 percent at the beginning of the run.

**Objective brake factor** means the arithmetic average of all the brake factors measured over the twenty brake applications defined in S7.4, for all wheel positions having a given brake configuration.

**Peak friction coefficient** or **PFC** means the ratio of the maximum value of braking test wheel longitudinal force to the simultaneous vertical force occurring prior to wheel lockup, as the braking torque is progressively increased.

**Pressure component** means a brake system component that contains the brake system fluid and controls or senses the fluid pressure.

**Regenerative braking system** or **RBS** means an electrical energy system that is installed in an EV for recovering or dissipating kinetic energy, and which uses the propulsion motor(s) as a retarder for partial braking of the EV while returning electrical energy to the propulsion battery(s) or dissipating electrical energy.

**Snub** means the braking deceleration of a vehicle from a higher reference speed to a lower reference speed that is greater than zero.

**Split service brake system** means a brake system consisting of two or more subsystems actuated by a single control, designed so that a single failure in any subsystem (such as a leakage-type failure of a pressure component of a hydraulic subsystem except structural failure of a housing that is common to two or more subsystems, or an electrical failure in an electric subsystem) does not impair the operation of any other subsystem.

**Stopping distance** means the distance traveled by a vehicle from the point of application of force to the brake control to the point at which the vehicle reaches a full stop.

**Variable brake proportioning system** means a system that has one or more proportioning devices which automatically change the brake pressure ratio between any two or more wheels to compensate for changes in wheel loading due to static load changes and/or dynamic weight transfer, or due to deceleration.

**Wheel lockup** means 100 percent wheel slip.

S5. **Equipment requirements.**

S5.1. **Service brake system.** Each vehicle shall be equipped with a service brake system acting on all wheels.

S5.1.1. **Wear adjustment.** Wear of the service brakes shall be compensated for by means of a system of automatic adjustment.

S5.1.2. **Wear status.** The wear condition of all service brakes shall be indicated by either:

(a) Acoustic or optical devices warning the driver at his or her driving position when lining replacement is necessary, or

(b) A means of visually checking the degree of brake lining wear, from the outside or underside of the vehicle, utilizing only the tools or equipment normally supplied with the vehicle. The removal of wheels is permitted for this purpose.

S5.1.3 **Regenerative braking system.** (a) For an EV equipped with RBS, the RBS is considered to be part of the service brake system if it is automatically activated by an application of the service brake control, if there is no means provided for the driver to disconnect or otherwise deactivate it, and if it is activated in all transmission positions, including neutral.

(b) For an EV that is equipped with both ABS and RBS that is part of the service brake system, the ABS must control the RBS.

S5.2. **Parking brake system.** Each vehicle shall be equipped with a parking brake system of a friction type with solely mechanical means to retain engagement.

S5.3. **Controls.**

S5.3.1. The service brakes shall be activated by means of a foot control. The control of the parking brake shall be independent of the service brake control, and may be either a hand or foot control.

S5.3.2. For vehicles equipped with ABS, a control to manually disable the ABS, either fully or partially, is prohibited.

S5.4. **Reservoirs.**

S5.4.1. **Master cylinder reservoirs.** A master cylinder shall have a reservoir.
§ 571.135

49 CFR Ch. V (10–1–08 Edition)

compartment for each service brake subsystem serviced by the master cylinder. Loss of fluid from one compartment shall not result in a complete loss of brake fluid from another compartment.

S5.4.2. Reservoir capacity. Reservoirs, whether for master cylinders or other type systems, shall have a total minimum capacity equivalent to the fluid displacement resulting when all the wheel cylinders or caliper pistons serviced by the reservoirs move from a new lining, fully retracted position (as adjusted initially to the manufacturer’s recommended setting) to a fully worn, fully applied position, as determined in accordance with S7.17(c) of this standard. Reservoirs shall have completely separate compartments for each subsystem except that in reservoir systems utilizing a portion of the reservoir for a common supply to two or more subsystems, individual partial compartments shall each have a minimum volume of fluid equal to at least the volume displaced by the master cylinder piston servicing the subsystem, during a full stroke of the piston. Each brake power unit reservoir servicing only the brake system shall have a minimum capacity equivalent to the fluid displacement required to charge the system piston(s) or accumulator(s) to normal operating pressure plus the displacement resulting when all the wheel cylinders or caliper pistons serviced by the reservoir or accumulator(s) move from a new lining, fully retracted position (as adjusted initially to the manufacturer’s recommended setting) to a fully worn, fully applied position.

S5.4.3. Reservoir labeling. Each vehicle equipped with hydraulic brakes shall have a brake fluid warning statement that reads as follows, in letters at least 3.2 mm (1/8 inch) high: “WARNING: Clean filler cap before removing. Use only fluid from a sealed container.” (Inserting the recommended type of brake fluid as specified in 49 CFR 571.116, e.g., “DOT 3.”) The lettering shall be:

(a) Permanently affixed, engraved or embossed;
(b) Located so as to be visible by direct view, either on or within 100 mm (3.94 inches) of the brake fluid reservoir filler plug or cap; and
(c) Of a color that contrasts with its background, if it is not engraved or embossed.

S5.4.4. Fluid level indication. Brake fluid reservoirs shall be so constructed that the level of fluid can be checked without need for the reservoir to be opened. This requirement is deemed to have been met if the vehicle is equipped with a transparent brake fluid reservoir or a brake fluid level indicator meeting the requirements of S5.5.1(a)(1).

S5.5. Brake system warning indicator. Each vehicle shall have one or more visual brake system warning indicators, mounted in front of and in clear view of the driver, which meet the requirements of S5.5.1 through S5.5.5. In addition, a vehicle manufactured without a split service brake system shall be equipped with an audible warning signal that activates under the conditions specified in S5.5.1(a).

S5.5.1. Activation. An indicator shall be activated when the ignition (start) switch is in the “on” (“run”) position and whenever any of conditions (a) through (g) occur:

(a) A gross loss of fluid or fluid pressure (such as caused by rupture of a brake line but not by a structural failure of a housing that is common to two or more subsystems) as indicated by one of the following conditions (chosen at the option of the manufacturer):

(1) A drop in the level of the brake fluid in any master cylinder reservoir compartment to less than the recommended safe level specified by the manufacturer or to one-fourth of the fluid capacity of that reservoir compartment, whichever is greater.

(b) Any electrical functional failure in an antilock or variable brake proportioning system.

(c) Application of the parking brake.
(d) Brake lining wear-out, if the manufacturer has elected to use an electrical device to provide an optical warning to meet the requirements of §5.1.2(a).

(e) For a vehicle with electrically-actuated service brakes, failure of the source of electric power to those brakes, or diminution of state of charge of the batteries to less than a level specified by the manufacturer for the purpose of warning a driver of degraded brake performance.

(f) For a vehicle with electric transmission of the service brake control signal, failure of a brake control circuit.

(g) For an EV with a regenerative braking system that is part of the service brake system, failure of the RBS.

§5.5.2. Function check.

(a) All indicators shall be activated as a check function by either:

(1) Automatic activation when the ignition (start) switch is turned to the “on” (“run”) position when the engine is not running, or when the ignition (“start”) switch is in a position between “on” (“run”) and “start” that is designated by the manufacturer as a check position, or

(2) A single manual action by the driver, such as momentary activation of a test button or switch mounted on the instrument panel in front of and in clear view of the driver, or, in the case of an indicator for application of the parking brake, by applying the parking brake when the ignition is in the “on” (“run”) position.

(b) In the case of a vehicle that has an interlock device that prevents the engine from being started under one or more conditions, check functions meeting the requirements of §5.5.2(a) need not be operational under any condition in which the engine cannot be started.

(c) The manufacturer shall explain the brake check function test procedure in the owner’s manual.

§5.5.3. Duration. Each indicator activated due to a condition specified in §5.5.1 shall remain activated as long as the condition exists, whenever the ignition (“start”) switch is in the “on” (“run”) position, whether or not the engine is running.

§5.5.4. Function. When a visual warning indicator is activated, it may be continuous or flashing, except that the visual warning indicator on a vehicle not equipped with a split service brake system shall be flashing. The audible warning required for a vehicle manufactured without a split service brake system may be continuous or intermittent.

§5.5.5. Labeling.

(a) Each visual indicator shall display a word or words in accordance with the requirements of Standard No. 101 (49 CFR 571.101) and this section, which shall be legible to the driver under all daytime and nighttime conditions when activated. Unless otherwise specified, the words shall have letters not less than 3.2 mm (1/8 inch) high and the letters and background shall be of contrasting colors, one of which is red. Words or symbols in addition to those required by Standard No. 101 and this section may be provided for purposes of clarity.

(b) Vehicles manufactured with a split service brake system may use a separate indicator to indicate the failure condition in §5.5.1(a). This indicator shall display the word “Brake.”

(c) A vehicle manufactured without a split service brake system shall use a separate indicator to indicate the failure condition in §5.5.1(a). This indicator shall display the word “Stop—Brake Failure” in block capital letters not less than 6.4 mm (1/4 inch) in height.

(d) If separate indicators are used for one or more of the conditions described in §5.5.1(a) through §5.5.1(g), the indicators shall display the following wording:

(1) If a separate indicator is provided for the low brake fluid condition in §5.5.1(a)(1), the words “Brake Fluid” shall be used except for vehicles using hydraulic system mineral oil.

(2) If a separate indicator is provided for the gross loss of pressure condition in §5.5.1(a)(2), the words “Brake Pressure” shall be used except for vehicles using hydraulic system mineral oil.

(3) If a separate indicator is provided for the condition specified in §5.5.1(b), the letters and background shall be of contrasting colors, one of which is yellow. The indicator shall be labeled with the words “Antilock” or “Anti-lock” or “ABS”; or “Brake Proportioning.”
in accordance with Table 2 of Standard No. 101.

(4) If a separate indicator is provided for application of the parking brake as specified for §5.5.1(c), the single word “Park” or the words “Parking Brake” may be used.

(5) If a separate indicator is provided to indicate brake lining wear-out as specified for §5.5.1(d), the words “Brake Wear” shall be used.

(6) If a separate indicator is provided for the condition specified in §5.5.1(g), the letters and background shall be of contrasting colors, one of which is yellow. The indicator shall be labeled with the symbol “RBS.” RBS failure in a system that is part of the service brake system may also be indicated by a yellow lamp that also indicates “ABS” failure and displays the symbol “ABS/RBS.”

(7) If a separate indicator is provided for any other function, the display shall include the word “Brake” and the appropriate additional labeling.

§5.6. Brake system integrity. Each vehicle shall meet the complete performance requirements of this standard without:

(a) Detachment or fracture of any component of the braking system, such as brake springs and brake shoes or disc pad facings other than minor cracks that do not impair attachment of the friction facings. All mechanical components of the braking system shall be intact and functional. Friction facing tearout (complete detachment of lining) shall not exceed 10 percent of the lining on any single frictional element.

(b) Any visible brake fluid or lubricant on the friction surface of the brake, or leakage at the master cylinder or brake power unit reservoir cover, seal, and filler openings.

§6. General test conditions. Each vehicle must meet the performance requirements specified in §7 under the following test conditions and in accordance with the test procedures and test sequence specified. Where a range of conditions is specified, the vehicle must meet the requirements at all points within the range.

§6.1. Ambient conditions.

S6.1.1. Ambient temperature. The ambient temperature is any temperature between 0 °C (32 °F) and 40 °C (104 °F).

S6.1.2. Wind speed. The wind speed is not greater than 5 m/s (11.2 mph).

§6.2. Road test surface.

S6.2.1. Pavement friction. Unless otherwise specified, the road test surface produces a peak friction coefficient (PFC) of 0.9 when measured using an American Society for Testing and Materials (ASTM) E1136 standard reference test tire, in accordance with ASTM Method E 1337–90, at a speed of 64.4 km/h (40 mph), without water delivery.

S6.2.2. Gradient. Except for the parking brake gradient holding test, the test surface has no more than a 1% gradient in the direction of testing and no more than a 2% gradient perpendicular to the direction of testing.

S6.2.3. Lane width. Road tests are conducted on a test lane 3.5 m (11.5 ft) wide.

§6.3. Vehicle conditions.

S6.3.1. Vehicle weight.

S6.3.1.1. For the tests at GVWR, the vehicle is loaded to its GVWR such that the weight on each axle as measured at the tire-ground interface is in proportion to its GAWR, with the fuel tank filled to 100% of capacity. However, if the weight on any axle of a vehicle at LLVW exceeds the axle’s proportional share of the GVWR, the load required to reach GVWR is placed so that the weight on that axle remains the same as at LLVW.

S6.3.1.2. For the test at LLVW, the vehicle is loaded to its LLVW such that the added weight is distributed in the front passenger seat area.

S6.3.2. Fuel tank loading. The fuel tank is filled to 100% of capacity at the beginning of testing and may not be less than 75% of capacity during any part of the testing.

S6.3.3. Lining preparation. At the beginning of preparation for the road tests, the brakes of the vehicle are in the same condition as when the vehicle was manufactured. No burnishing or other special preparation is allowed, unless all vehicles sold to the public are similarly prepared as a part of the manufacturing process.
S6.3.4. Adjustments and repairs. These requirements must be met without replacing any brake system parts or making any adjustments to the brake system except as specified in this standard. Where brake adjustments are specified (S7.1.3), adjust the brakes, including the parking brakes, in accordance with the manufacturer’s recommendation. No brake adjustments are allowed during or between subsequent tests in the test sequence.

S6.3.5. Automatic brake adjusters. Automatic adjusters are operational throughout the entire test sequence. They may be adjusted either manually or by other means, as recommended by the manufacturer, only prior to the beginning of the road test sequence.

S6.3.6. Antilock brake system (ABS). If a car is equipped with an ABS, the ABS is fully operational for all tests, except as specified in the following sections.

S6.3.7. Variable brake proportioning valve. If a car is equipped with a variable brake proportioning system, the proportioning valve is fully operational for all tests except the test for failed variable brake proportioning system.

S6.3.8. Tire inflation pressure. Tires are inflated to the pressure recommended by the vehicle manufacturer for the GVWR of the vehicle.

S6.3.9. Engine. Engine idle speed and ignition timing are set according to the manufacturer’s recommendations. If the vehicle is equipped with an adjustable engine speed governor, it is adjusted according to the manufacturer’s recommendations.

S6.3.10. Vehicle openings. All vehicle openings (doors, windows, hood, trunk, convertible top, cargo doors, etc.) are closed except as required for instrumentation purposes.

S6.3.11 State of charge of batteries for EVs.

S6.3.11.1 The state of charge of the propulsion batteries is determined in accordance with SAE Recommended Practice J227a, Electric Vehicle Test Procedure, February 1976. The applicable sections of J227a are 3.2.1 through 3.2.4, 3.3.1 through 3.3.2.2, 3.4.1 and 3.4.2, 4.2.1, 5.2, 5.2.1 and 5.3.

S6.3.11.2 At the beginning of the burnish procedure (S7.1 of this standard) in the test sequence, each propulsion battery is at the maximum state of charge recommended by the manufacturer, as stated in the vehicle operator’s manual or on a label that is permanently attached to the vehicle, of, if the manufacturer has made no recommendation, not less than 95 percent. During the 200-stop burnish procedure, the propulsion batteries are restored to the maximum state of charge determined as above, after each increment of 40 burnish stops until the burnish procedure is complete. The batteries may be charged at a more frequent interval during a particular 40-stop increment only if the EV is incapable of achieving the initial burnish test speed during that increment. During the burnish procedure, the propulsion batteries may be charged by external means or replaced by batteries that are at a state of charge of not less than 95 percent. For an EV having a manual control for setting the level of regenerative braking, the manual control, at the beginning of the burnish procedure, is set to provide maximum regenerative braking throughout the burnish.

S6.3.11.3 At the beginning of each performance test in the test sequence (S7.2 through S7.17 of this standard), unless otherwise specified, an EV’s propulsion batteries are at the state of charge recommended by the manufacturer, as stated in the vehicle operator’s manual or on a label that is permanently attached to the vehicle, or, if the manufacturer has made no recommendation, at a state of charge of not less than 95 percent. No further charging of any propulsion battery occurs during any of the performance tests in the test sequence of this standard. If the propulsion batteries are depleted during a test sequence such that the vehicle reaches automatic shut-down, will not accelerate, or the low state of charge brake warning lamp is illuminated, the vehicle is to be accelerated to brake test speed by auxiliary means. If a battery is replaced rather than recharged, the replacement battery shall be charged and measured for state of charge in accordance with these procedures.

S6.3.12 State of charge of batteries for electrically-actuated service brakes. A vehicle equipped with electrically-actuated service brakes also performs the
following test series. Conduct 10 stopping tests from a speed of 100 kph or the maximum vehicle speed, whichever is less. At least two of the 10 stopping distances must be less than or equal to 70 meters. The vehicle is loaded to GVWR and the transmission is in the neutral position when the service brake control is actuated and throughout the remainder of the test. Each battery providing power to the electrically-actuated service brakes, shall be in a depleted state of charge for conditions (a), (b), or (c) of this paragraph as appropriate. An auxiliary means may be used to accelerate an EV to test speed.

(a) For an EV equipped with electrically-actuated service brakes deriving power from the propulsion batteries and with automatic shut-down capability of the propulsion motor(s), the propulsion batteries are at not more than five percent above the EV actual automatic shut-down critical value. The critical value is determined by measuring the state-of-charge of each propulsion battery at the instant that automatic shut-down occurs.

(b) For an EV equipped with electrically-actuated service brakes deriving power from the propulsion batteries and with no automatic shut-down capability of the propulsion motor(s), the propulsion batteries are at an average of not more than five percent above the actual state of charge at which the brake failure warning signal, required by S5.5.1(e) of this standard, is illuminated.

c) For a vehicle which has one or more auxiliary batteries that provides electrical energy to operate the electrically-actuated service brakes, each auxiliary battery is at not more than five percent above the actual state of charge at which the brake failure warning signal, required by S5.5.1(e) of this standard, is illuminated.

§6.13 Electric vehicles.

S6.13.1 (a) For an EV equipped with an RBS that is part of the service brake system, the RBS is operational during the burnish and all tests, except for the test of a failed RBS.

(b) For an EV equipped with an RBS that is not part of the service brake system, the RBS is operational and set to produce the maximum regenerative braking effect during the burnish, and is disabled during the test procedures. If the vehicle is equipped with a neutral gear that automatically disables the RBS, the test procedures which are designated to be conducted in gear may be conducted in neutral.

S6.3.13.2 For tests conducted “in neutral”, the operator of an EV with no “neutral” position (or other means such as a clutch for disconnecting the drive train from the propulsion motor(s)) does not apply any electromotive force to the propulsion motor(s). Any electromotive force that is applied to the propulsion motor(s) automatically remains in effect unless otherwise specified by the test procedure.

S6.4. Instrumentation.

S6.4.1. Brake temperature measurement. The brake temperature is measured by plug-type thermocouples installed in the approximate center of the facing length and width of the most heavily loaded shoe or disc pad, one per brake, as shown in Figure 1. A second thermocouple may be installed at the beginning of the test sequence if the lining wear is expected to reach a point causing the first thermocouple to contact the metal rubbing surface of a drum or rotor. For center-grooved shoes or pads, thermocouples are installed within 3 mm (.12 in) to 6 mm (.24 in) of the groove and as close to the center as possible.

S6.4.2. Brake line pressure measurement for the torque wheel test. The vehicle shall be fitted with pressure transducers in each hydraulic circuit. On hydraulically proportioned circuits, the pressure transducer shall be downstream of the operative proportioning valve.

S6.4.3. Brake torque measurement for the torque wheel test. The vehicle shall be fitted with torque wheels at each wheel position, including slip ring assemblies and wheel speed indicators to permit wheel lock to be detected.
§ 571.135

S6.5. Procedural conditions.

S6.5.1. Brake control. All service brake system performance requirements, including the partial system requirements of S7.7, S7.10 and S7.11, must be met solely by use of the service brake control.

S6.5.2. Test speeds. If a vehicle is incapable of attaining the specified normal test speed, it is tested at a speed that is a multiple of 5 km/h (3.1 mph) that is 4 to 8 km/h (2.5 to 5.0 mph) less than its maximum speed and its performance must be within a stopping distance given by the formula provided for the specific requirement.

S6.5.3. Stopping distance.

S6.5.3.1. The braking performance of a vehicle is determined by measuring the stopping distance from a given initial speed.

S6.5.3.2. Unless otherwise specified, the vehicle is stopped in the shortest distance achievable (best effort) on all stops. Where more than one stop is required for a given set of test conditions, a vehicle is deemed to comply with the corresponding stopping distance requirements if at least one of the stops is made within the prescribed distance.

**Figure 1—Typical Plug-Type Thermocouple Installations**
§ 571.135  

49 CFR Ch. V (10–1–08 Edition)  

S6.5.3.3. In the stopping distance formulas given for each applicable test (such as \(S=0.10V+0.0060V^2\)), \(S\) is the maximum stopping distance in meters, and \(V\) is the test speed in km/h.

S6.5.4. Vehicle position and attitude.

S6.5.4.1. The vehicle is aligned in the center of the lane at the start of each brake application. Steering corrections are permitted during each stop.

S6.5.4.2. Stops are made without any part of the vehicle leaving the lane and without rotation of the vehicle about its vertical axis of more than ±15° from the center line of the test lane at any time during any stop.

S6.5.5. Transmission selector control.

S6.5.5.1. For tests in neutral, a stop or snub is made in accordance with the following procedures:

(a) Exceed the test speed by 6 to 12 km/h (3.7 to 7.5 mph);
(b) Close the throttle and coast in gear to approximately 3 km/h (1.9 mph) above the test speed;
(c) Shift to neutral; and
(d) When the test speed is reached, apply the brakes.

S6.5.5.2. For tests in gear, a stop or snub is made in accordance with the following procedures:

(a) With the transmission selector in the control position recommended by the manufacturer for driving on a level surface at the applicable test speed, exceed the test speed by 6 to 12 km/h (3.7 to 7.5 mph);
(b) Close the throttle and coast in gear; and
(c) When the test speed is reached, apply the brakes.

(d) To avoid engine stall, a manual transmission may be shifted to neutral (or the clutch disengaged) when the vehicle speed is below 30 km/h (18.6 mph).

S6.5.6. Initial brake temperature (IBT).

If the lower limit of the specified IBT for the first stop in a test sequence (other than a parking brake grade holding test) has not been reached, the brakes are heated to the IBT by making one or more brake applications from a speed of 50 km/h (31.1 mph), at a deceleration rate not greater than 3 m/s² (9.8 fps²).

S7. Road test procedures and performance requirements. Each vehicle shall meet all the applicable requirements of this section, when tested according to the conditions and procedures set forth below and in S6, in the sequence specified in Table 1:

S7.1. Burnish.

S7.1.1. General information. Any pretest instrumentation checks are conducted as part of the burnish procedure, including any necessary rechecks after instrumentation repair, replacement or adjustment. Instrumentation check test conditions must be in accordance with the burnish test procedure specified in S7.1.2 and S7.1.3.

S7.1.2. Vehicle conditions.

(a) Vehicle load: GVWR only.

(b) Transmission position: In gear.

S7.1.3. Test conditions and procedures.

The road test surface conditions specified in S6.2 do not apply to the burnish procedure.

(a) IBT: ≤100 °C (212 °F).

(b) Test speed: 80 km/h (49.7 mph).

(c) Pedal force: Adjust as necessary to maintain specified constant deceleration rate.

(d) Deceleration rate: Maintain a constant deceleration rate of 3.0 m/s² (9.8 fps²).
(e) Wheel lockup: No lockup of any wheel allowed for longer than 0.1 seconds at speeds greater than 15 km/h (9.3 mph).

(f) Number of runs: 200 stops.

(g) Interval between runs: The interval from the start of one service brake application to the start of the next is either the time necessary to reduce the IBT to 100 °C (212 °F) or less, or the distance of 2 km (1.24 miles), whichever occurs first.

(h) Accelerate to 80 km/h (49.7 mph) after each stop and maintain that speed until making the next stop.

(i) After burnishing, adjust the brakes as specified in S6.3.4.

§ 571.135 Wheel lockup sequence.

S7.2.1 General information. (a) The purpose of this test is to ensure that lockup of both front wheels occurs either simultaneously with, or at a lower deceleration rate than, the lockup of both rear wheels, when tested on road surfaces affording adhesion such that wheel lockup of the first axle occurs at a braking ratio of between 0.15 and 0.80, inclusive.

(b) This test is for vehicles without antilock brake systems.

(c) This wheel lock sequence test is to be used as a screening test to evaluate a vehicle’s axle lockup sequence and to determine whether the torque wheel test in S7.4 must be conducted.

(d) For this test, a simultaneous lockup of the front and rear wheels refers to the conditions when the time interval between the first occurrence of lockup of the last (second) wheel on the rear axle and the first occurrence of lockup of the last (second) wheel on the front axle is ≤ 0.1 second for vehicle speeds > 15 km/h (9.3 mph).

(e) A front or rear axle lockup is defined as the point in time when the last (second) wheel on an axle locks up.

(f) Vehicles that lock their front axle simultaneously or at lower deceleration rates than their rear axle need not be tested to the torque wheel procedure.

(g) Vehicles which lock their rear axle at deceleration rates lower than the front axle shall also be tested in accordance with the torque wheel procedure in S7.4.

(h) Any determination of noncompliance for failing adhesion utilization requirements shall be based on torque wheel test results.

S7.2.2 Vehicle conditions. (a) Vehicle load: GVWR and LLVW.

(b) Transmission position: In neutral.

S7.2.3 Test Conditions and Procedures. (a) IBT: ≤ 65 °C (149 °F), ≤ 100 °C (212 °F).

(b) Test speed: 65 km/h (40.4 mph) for a braking ratio ≤ 0.50; 100 km/h (62.1 mph) for a braking ratio > 0.50.

(c) Pedal force:

(1) Pedal force is applied and controlled by the vehicle driver or by a mechanical brake pedal actuator.

(2) Pedal force is increased at a linear rate such that the first axle lockup occurs no less than one-half (0.5) second and no more than one and one-half (1.5) seconds after the initial application of the pedal.

(3) The pedal is released when the second axle locks, or when the pedal force reaches 1kN (225 lbs), or 0.1 seconds after first axle lockup, whichever occurs first.

(d) Wheel lockup: Only wheel lockups above a vehicle speed of 15 km/h (9.3 mph) are considered in determining the results of this test.

(e) Test surfaces: This test is conducted, for each loading condition, on two different test surfaces that will result in a braking ratio of between 0.15 and 0.80, inclusive. NHTSA reserves the right to choose the test surfaces to be used based on adhesion utilization curves or any other method of determining “worst case” conditions.

(f) The data recording equipment shall have a minimum sampling rate of 40 Hz.

(g) Data to be recorded. The following information must be automatically recorded in phase continuously throughout each test run such that values of the variables can be cross referenced in real time.

(1) Vehicle speed.

(2) Brake pedal force.

(3) Angular velocity at each wheel.

(4) Actual instantaneous vehicle deceleration or the deceleration calculated by differentiation of the vehicle speed.

(h) Speed channel filtration. For analog instrumentation, the speed channel shall be filtered by using a low-pass filter having a cut-off frequency of less than one fourth the sampling rate.
§ 571.135

19 CFR Ch. V (10–1–08 Edition)

(i) Test procedure. For each test surface, three runs meeting the pedal force application and time for wheel lockup requirements shall be made. Up to a total of six runs will be allowed to obtain three valid runs. Only the first three valid runs obtained shall be used for data analysis purposes.

S7.2.4. Performance requirements. (a) In order to pass this test a vehicle shall be capable of meeting the test requirements on all test surfaces that will result in a braking ratio of between 0.15 and 0.80, inclusive.

(b) If all three valid runs on each surface result in the front axle locking before or simultaneously with the rear axle, or the front axle locks up with only one or no wheels locking on the rear axle, the torque wheel procedure need not be run, and the vehicle is considered to meet the adhesion utilization requirements of this Standard. This performance requirement shall be met for all vehicle braking ratios between 0.15 and 0.80.

(c) If any one of the three valid runs on any surface results in the rear axle locking before the front axle or the rear axle locks up with only one or no wheels locking on the front axle, the torque wheel procedure shall be performed. This performance requirement shall be met for all vehicle braking ratios between 0.15 and 0.80.

(d) If any one of the three valid runs on any surface results in neither axle locking (i.e., only one or no wheels locked on each axle) before a pedal force of 1 kN (225 lbs) is reached, the vehicle shall be tested to the torque wheel procedure.

(e) If the conditions listed in paragraph (c) or (d) of this section occur, vehicle compliance shall be determined from the results of a torque wheel test performed in accordance with S7.4.

(f) An EV with RBS that is part of the service brake system shall meet the performance requirements over the entire normal operating range of the RBS.

S7.3. ABS performance. [Reserved]

S7.4. Adhesion utilization (Torque Wheel Method).

S7.4.1. General information. This test is for vehicles without any ABS. The purpose of the test is to determine the adhesion utilization of a vehicle.

S7.4.2. Vehicle conditions. (a) Vehicle load: GVWR and LLVW.

(b) Transmission position: In neutral.

(c) Tires: For this test, a separate set of tires, identical to those used for all other tests under Section 7.0, may be used.

S7.4.3. Test conditions and procedures. (a) IBT: ≤65 °C (149 °F), ≤100 °C (212 °F).

(b) Test speeds: 100 km/h (62.1 mph), and 50 km/h (31.1 mph).

(c) Pedal force: Pedal force is increased at a linear rate between 100 and 150 N/sec (22.5 and 33.7 lbs/sec) for the 100 km/h test speed, or between 100 and 200 N/sec (22.5 and 45.0 lbs/sec) for the 50 km/h test speed, until the first axle locks or until a pedal force of 1 kN (225 lbs) is reached, whichever occurs first.

(d) Cooling: Between brake applications, the vehicle is driven at speeds up to 100 km/h (62.1 mph) until the IBT specified in S7.4.3(a) is reached.

(e) Number of runs: With the vehicle at LLVW, run five stops from a speed of 100 km/h (62.1 mph) and five stops from a speed of 50 km/h (31.1 mph), while alternating between the two test speeds after each stop. With the vehicle at GVWR, repeat the five stops at each test speed while alternating between the two test speeds.

(f) Test surface: PFC of at least 0.9.

(g) Data to be recorded. The following information must be automatically recorded in phase continuously throughout each test run such that values of the variables can be cross referenced in real time:

(1) Vehicle speed.

(2) Brake pedal force.

(3) Angular velocity at each wheel.

(4) Brake torque at each wheel.

(5) Hydraulic brake line pressure in each brake circuit. Hydraulically proportioned circuits shall be fitted with transducers on at least one front wheel and one rear wheel downstream of the operative proportioning or pressure limiting valve(s).

(6) Vehicle deceleration.

(h) Sample rate: All data acquisition and recording equipment shall support a minimum sample rate of 40 Hz on all channels.

(i) Determination of front versus rear brake pressure. Determine the front
versus rear brake pressure relationship over the entire range of line pressures. Unless the vehicle has a variable brake proportioning system, this determination is made by static test. If the vehicle has a variable brake proportioning system, dynamic tests are run with the vehicle both empty and loaded. 15 snubs from 50 km/h (31.1 mph) are made for each of the two load conditions, using the same initial conditions specified in this section.

S7.4.4. Data reduction. (a) The data from each brake application under S7.4.3 is filtered using a five-point, on-center moving average for each data channel.

(b) For each brake application under S7.4.3 determine the slope (brake factor) and pressure axis intercept (brake hold-off pressure) of the linear least squares equation best describing the measured torque output at each braked wheel as a function of measured line pressure applied at the same wheel. Only torque output values obtained from data collected when the vehicle deceleration is within the range of 0.15g to 0.80g are used in the regression analysis.

(c) Average the results of paragraph (b) of this section to calculate the average brake factor and brake hold-off pressure for all brake applications for the front axle.

(d) Average the results of paragraph (b) of this section to calculate the average brake factor and brake hold-off pressure for all brake applications for the rear axle.

(e) Using the relationship between front and rear brake line pressure determined in S7.4.3(i) and the tire rolling radius, calculate the braking force at each axle as a function of front brake line pressure.

(f) Calculate the braking ratio of the vehicle as a function of the front brake line pressure using the following equation:

\[ z = \frac{T_1 + T_2}{P} \]

where \( z \) = braking ratio at a given front line pressure;
\( T_1, T_2 \) = Braking forces at the front and rear axles, respectively, corresponding to the same front brake line pressure, and
\( P \) = total vehicle weight.

(g) Calculate the adhesion utilized at each axle as a function of braking ratio using the following equations:

\[ f_i = \frac{T_i}{P_i + z h P / E} \]
\[ f_2 = \frac{T_2}{P_2 - z h P / E} \]

where \( f_i \) = adhesion utilized by axle \( i \)
\( T_i \) = braking force at axle \( i \) (from (e))
\( P_i \) = static weight on axle \( i \)
\( h \) = height of center of gravity of the vehicle
\( z \) = braking ratio (from (f))
\( P \) = total vehicle weight
\( E \) = wheelbase

(h) Plot \( f_1 \) and \( f_2 \) obtained in (g) as a function of \( z \), for both GVWR and LLVW load conditions. These are the adhesion utilization curves for the vehicle, which are compared to the performance requirements in S7.4.5, shown graphically in Figure 2:
§ 571.135 49 CFR Ch. V (10–1–08 Edition)

S7.4.5. Performance requirements. For all braking ratios between 0.15 and 0.80, each adhesion utilization curve for a rear axle shall be situated below a line defined by $z = 0.9k$ where $z$ is the braking ratio and $k$ is the PFC.

S7.4.5.1 An EV with RBS that is part of the service brake system shall meet the performance requirement over the entire normal operating range of the RBS.

S7.5. Cold effectiveness.

S7.5.1. Vehicle conditions. (a) Vehicle load: GVWR and LLVW.
(b) Transmission position: In neutral.

S7.5.2. Test conditions and procedures. (a) IBT: ≤65 °C (149 °F), ≤100 °C (212 °F).
(b) Test speed: 100 km/h (62.1 mph).
(c) Pedal force: ≤65N (14.6 lbs), ≤500N (112.4 lbs).
(d) Wheel lockup: No lockup of any wheel for longer than 0.1 seconds allowed at speeds greater than 15 km/h (9.3 mph).
(e) Number of runs: 6 stops.
(f) Test surface: PFC of 0.9.
(g) For each stop, bring the vehicle to test speed and then stop the vehicle in the shortest possible distance under the specified conditions.

Figure 2—Adhesion Utilization Requirements
S7.5.3. Performance requirements. (a) Stopping distance for 100 km/h test speed: ≤70m (230 ft).
    (b) Stopping distance for reduced test speed: S ≤ 0.10V + 0.006V^2.

S7.6. High speed effectiveness. This test is not run if vehicle maximum speed is less than or equal to 125 km/h (77.7 mph).

S7.6.1. Vehicle conditions. (a) Vehicle load: GVWR and LLVW.
    (b) Transmission position: In gear.
    (c) Vehicle engine: Off (not running).
    (d) IBT: in the "on" position.
    (e) Stopping distance for 100 km/h test speed: ≤70m (230 ft.)
    (f) Test speed: 100 km/h (62.1 mph).
    (g) Functional failure simulation:
        (1) Disconnect the functional power source, or any other electrical connector that creates a functional failure.
        (2) Determine whether the brake system indicator is activated when any electrical functional failure of the antilock system is created.
        (3) Restore the system to normal at the completion of this test.
    (h) If more than one antilock brake subsystem is provided, repeat test for each subsystem.

S7.7. Stops with Engine Off. S7.7.1. General information. This test is for vehicles equipped with one or more brake power units or brake power assist units. This test is also for EVs.

S7.7.2. Vehicle conditions. (a) Vehicle load: GVWR only.
    (b) Transmission position: In neutral.
    (c) Vehicle engine: Off (not running).
    (d) IBT: ≤ 85 °C (185 °F), ≤ 100 °C (212 °F).
    (e) Number of runs: 6 stops.
    (f) Stopping distance for reduced test speed: S ≤ 0.10V + 0.006V^2.
    (g) Test surface: PFC of 0.9.

S7.7.3. Test conditions and procedures. (a) IBT: ≤ 85 °C (185 °F), ≤ 100 °C (212 °F).
    (b) Test speed: 100 km/h (62.1 mph).
    (c) Pedal force: ≤ 65N (14.6 lbs), ≤ 500N (112.4 lbs).
    (d) Wheel lockup: No lockup of any wheel for longer than 0.1 seconds allowed at speeds greater than 15 km/h (9.3 mph).
    (e) Number of runs: 6 stops.
    (f) Test surface: PFC of 0.9.

    (b) Transmission position: In neutral.
    (c) Vehicle engine: Off (not running).
    (d) IBT: ≤ 85 °C (185 °F), ≤ 100 °C (212 °F).
    (e) Number of runs: 6 stops.
    (f) Stopping distance for reduced test speed: S ≤ 0.10V + 0.006V^2.
    (g) Functional failure simulation:
        (1) Disconnect the functional power source, or any other electrical connector that creates a functional failure.
        (2) Determine whether the brake system indicator is activated when any electrical functional failure of the antilock system is created.
        (3) Restore the system to normal at the completion of this test.
    (h) For an EV, this test is conducted with no electrical power supplied to the vehicle's propulsion motor(s), but with the RBS and brake power or power assist still operating, unless cutting off the supply of electrical power to the propulsion motor(s) also disables those systems.

    (b) Transmission position: In neutral.
S7.9.2 Test conditions and procedures.
(a) IBT: ≤65 °C (149 °F), ≤100 °C (212 °F).
(b) Test speed: 100 km/h (62.1 mph).
(c) Pedal force: ≤65 N (14.6 lbs), ≤500 N (112.4 lbs).
(d) Wheel lockup: No lockup of any wheel for longer than 0.1 seconds allowed at speeds greater than 15 km/h (9.3 mph).
(e) Number of runs: 6 stops.
(f) Test surface: PFC of 0.9.

S7.9.3 Performance requirements.
The service brakes on a vehicle equipped with one or more variable brake proportioning systems, in the event of any single functional failure in any such system, shall continue to operate and shall stop the vehicle as specified in S7.9.3(a) or S7.9.3(b).
(a) Stopping distance for 100 km/h test speed: ≤110 m (361 ft).
(b) Stopping distance for reduced test speed: S ≤0.10V + 0.0100V².

S7.10 Hydraulic circuit failure.
S7.10.1 General information. This test is for vehicles manufactured with or without a split service brake system. For vehicles manufactured with a split service brake system, in the event of any failure in a single subsystem, as specified in S7.10.3(f) of this standard, and after activation of the brake system indicator as specified in S5.5.1 of this standard, the vehicle shall, by operation of the service brake control, stop 10 times consecutively as specified in S7.10.4(a) or S7.10.4(b). For vehicles not manufactured with a split service brake system, in the event of any failure in any component of the service brake system, as specified in S7.10.3(f), and after activation of the brake system indicator as specified in S5.5.1 of this standard, the vehicle shall, by operation of the service brake control, stop 10 times consecutively as specified in S7.10.4(a) or S7.10.4(b).
(a) Stopping distance from 100 km/h test speed: ≤168 m (551 ft).
§ 571.135

(b) Stopping distance for reduced test speed: \( S \leq 0.10V + 0.0158V^2 \).

S7.11. Brake power unit or brake power assist unit inoperative (System depleted).

S7.11.1. General information. This test is for vehicles equipped with one or more brake power units or brake power assist units.

S7.11.2. Vehicle conditions. (a) Vehicle load: GVWR only.

(b) Transmission position: In neutral.

S7.11.3. Test conditions and procedures.

(a) IBT: \( \leq 65 \, ^\circ C (149 \, ^\circ F) \), \( \leq 100 \, ^\circ C (212 \, ^\circ F) \).

(b) Test speed: 100 km/h (62.1 mph).

(c) Pedal force: \( \leq 65 \, N (14.6 \, lbs) \), \( \leq 500 \, N (112.4 \, lbs) \).

(d) Wheel lockup: No lockup of any wheel for longer than 0.1 seconds allowed at speeds greater than 15 km/h (9.3 mph).

(e) Number of runs: 6 stops.

(f) Test surface: PFC of 0.9.

(g) Disconnect the primary source of power for one brake power assist unit or brake power unit, or one of the brake power unit or brake power assist unit subsystems if two or more subsystems are provided.

(h) If the brake power unit or power assist unit operates in conjunction with a backup system and the backup system is automatically activated in the event of a primary power service failure, the backup system is operative during this test.

(i) Exhaust any residual brake power reserve capability of the disconnected system.

(j) Make each of the 6 stops by a continuous application of the service brake control.

(k) Restore the system to normal at completion of this test.

(l) For vehicles equipped with more than one brake power unit or brake power assist unit, conduct tests for each in turn.

(m) For vehicles with electrically-actuated service brakes (brake power unit), this test is conducted with any single electrical failure in the electrically-actuated service brakes instead of a failure of any other brake power or brake power assist unit, and all other systems intact.

S7.11.4. Performance requirements. The service brakes on a vehicle equipped with one or more brake power assist units or brake power units, with one such unit inoperative and depleted of all reserve capability, shall stop the vehicle as specified in S7.11.4(a) or S7.11.4(b).

(a) Stopping distance from 100 km/h test speed: \( \leq 168 \, m (551 \, ft) \).

(b) Stopping distance for reduced test speed: \( S \leq 0.10V + 0.0158V^2 \).

S7.12.1. Vehicle conditions. (a) Vehicle load: GVWR only.

(b) Transmission position: In neutral.

(c) Parking brake burnish:

(1) For vehicles with parking brake systems not utilizing the service friction elements, the friction elements of such a system are burnished prior to the parking brake test according to the published recommendations furnished to the purchaser by the manufacturer.

(2) If no recommendations are furnished, the vehicle’s parking brake system is tested in an unburnished condition.

(d) Parking brake applications: 1 application and up to 2 reapplications, if necessary.

S7.12.2. Test conditions and procedures.

(a) IBT:

(1) Parking brake systems utilizing service brake friction materials shall be tested with the IBT \( \leq 100 \, ^\circ C (212 \, ^\circ F) \) and shall have no additional burnishing or artificial heating prior to the start of the parking brake test.

(2) Parking brake systems utilizing non-service brake friction materials shall be tested with the friction materials at ambient temperature at the start of the test. The friction materials shall have no additional burnishing or artificial heating prior to or during the parking brake test.

(b) Parking brake control force: Hand control \( \leq 400 \, N (89.9 \, lbs) \); foot control \( \leq 500 \, N (112.4 \, lbs) \).

(c) Hand force measurement locations: The force required for actuation of a hand-operated brake system is measured at the center of the hand grip area or at a distance of 40 mm (1.57 in) from the end of the actuation lever as illustrated in Figure 3.

(d) Parking brake applications: 1 application and up to 2 reapplications, if necessary.
§571.135

(e) Test surface gradient: 20% grade.

(f) Drive the vehicle onto the grade with the longitudinal axis of the vehicle in the direction of the slope of the grade.

(g) Stop the vehicle and hold it stationary by applying the service brake control and place the transmission in neutral.

(h) With the service brake applied sufficiently to just keep the vehicle from rolling, apply the parking brake as specified in §7.12.2(l) or §7.12.2(j).

(i) For a vehicle equipped with mechanically-applied parking brakes, make a single application of the parking brake control with a force not exceeding the limits specified in §7.12.2(b). For a vehicle using an electrically-activated parking brake, apply the parking brake by activating the parking brake control.

(j) In the case of a parking brake system that does not allow application of the specified force in a single application, a series of applications may be made to achieve the specified force.

(k) Following the application of the parking brakes, release all force on the service brake control and, if the vehicle remains stationary, start the measurement of time.

(l) If the vehicle does not remain stationary, reapplication of a force to the parking brake control at the level specified in §7.12.2(b) as appropriate for the vehicle being tested (without release of the ratcheting or other holding mechanism of the parking brake) is used up to two times to attain a stationary position.

(m) Verify the operation of the parking brake application indicator.

(n) Following observation of the vehicle in a stationary condition for the specified time in one direction, repeat

Dimension a = 40 mm (1.57in)

Figure 3—Location for Measuring Brake Application Force

(Hand Brake)
the same test procedure with the vehicle orientation in the opposite direction on the same grade.

S7.12.3. **Performance requirement.** The parking brake system shall hold the vehicle stationary for 5 minutes in both a forward and reverse direction on the grade.

S7.13. **Heating Snubs.**

S7.13.1. **General information.** The purpose of the snubs is to heat up the brakes in preparation for the hot performance test which follows immediately.

S7.13.2. **Vehicle conditions.**

(a) Vehicle load: GVWR only.

(b) Transmission position: In gear.

S7.13.3. **Test conditions and procedures.**

(a) IBT:

(1) Establish an IBT before the first brake application (snub) of \(\leq 55 \, ^\circ \text{C} \) \((131 \, ^\circ \text{F})\), \(\leq 65 \, ^\circ \text{C} \) \((149 \, ^\circ \text{F})\).

(2) IBT before subsequent snubs are those occurring at the distance intervals.

(b) Number of snubs: 15.

(c) Test speeds: The initial speed for each snub is 120 km/h (74.6 mph) or 80\% of \(V_{\text{max}}\), whichever is slower. Each snub is terminated at one-half the initial speed.

(d) Deceleration rate:

(1) Maintain a constant deceleration rate of 3.0 m/s\(^2\) \((9.8 \text{ fps}^2)\).

(2) Attain the specified deceleration within one second and maintain it for the remainder of the snub.

(e) Pedal force: Adjust as necessary to maintain the specified constant deceleration rate.

(f) Time interval: Maintain an interval of 45 seconds between the start of brake applications (snubs).

(g) Accelerate as rapidly as possible to the initial test speed immediately after each snub.

(h) Immediately after the 15th snub, accelerate to 100 km/h (62.1 mph) and commence the hot performance test.

(i) Immediately after completion of the second hot performance stop, drive 1.5 km (0.93 mi) at 50 km/h (31.1 mph) before the first cooling stop.

S7.14. **Hot performance.**

S7.14.1. **General information.** The hot performance test is conducted immediately after completion of the 15th heating snub.

S7.14.2. **Vehicle conditions.**

(a) Vehicle load: GVWR only.

(b) Transmission position: In neutral.

S7.14.3. **Test conditions and procedures.**

(a) IBT: Temperature achieved at completion of heating snubs.

(b) Test speed: 100 km/h (62.1 mph).

(c) Pedal force:

(1) The first stop is done with an average pedal force not greater than the average pedal force recorded during the shortest GVWR cold effectiveness stop.

(2) The second stop is done with a pedal force not greater than 500 N (112.4 lbs).

(d) Wheel lockup: No lockup of any wheel for longer than 0.1 seconds allowed at speeds greater than 15 km/h (9.3 mph).

(e) Number of runs: 2 stops.

(f) Immediately after the 15th heating snub, accelerate to 100 km/h (62.1 mph) and commence the first stop of the hot performance test.

(g) If the vehicle is incapable of attaining 100 km/h, it is tested at the same speed used for the GVWR cold effectiveness test.

(h) Immediately after completion of the first hot performance stop, accelerate as rapidly as possible to the specified test speed and conduct the second hot performance stop.

(i) Immediately after completion of the second hot performance stop, drive 1.5 km (0.93 mi) at 50 km/h (31.1 mph) before the first cooling stop.

\[
S = 0.10V + \frac{0.0386V^2}{0.60(d_c)}
\]

where \(d_c\) = the average deceleration actually achieved during the shortest cold effectiveness stop at GVWR (m/s\(^2\)), \(S\) = actual stopping distance measured on the shortest cold effectiveness stop at GVWR (m), and \(V\) = cold effectiveness test speed (km/h).
§571.135  

(b) In addition to the requirement in S7.14.4(a), the stopping distance for at least one of the two hot stops must be \( S \leq 89 \text{ m (292 ft)} \) from a test speed of 100 km/h (62.1 mph) or, for reduced test speed, \( S \leq 0.10V + 0.0079V^2 \). The results of the second stop may not be used to meet the requirements of S7.14.4(a).

S7.15. Brake cooling stops.

S7.15.1. General information. The cooling stops are conducted immediately after completion of the hot performance test.

S7.15.2. Vehicle conditions. (a) Vehicle load: GVWR only.

(b) Transmission position: In gear.

S7.15.3. Test conditions and procedures. (a) IBT: Temperature achieved at completion of hot performance.

(b) Test speed: 50 km/h (31.1 mph).

(c) Pedal force: Adjust as necessary to maintain specified constant deceleration rate.

(d) Deceleration rate: Maintain a constant deceleration rate of 3.0 m/s\(^2\) (9.8 fps\(^2\)).

(e) Wheel lockup: No lockup of any wheel for longer than 0.1 seconds allowed at speeds greater than 15 km/h (9.3 mph).

(f) Number of runs: 4 stops.

(g) Immediately after the completion of hot performance stops drive 1.5 km (0.93 mi) at 50 km/h (31.1 mph) before the first cooling stop.

(h) For the first through the third cooling stops:

(1) After each stop, immediately accelerate at the maximum rate to 50 km/h (31.1 mph).

(2) Maintain that speed until beginning the next stop at a distance of 1.5 km (0.93 mi) from the beginning of the previous stop.

(i) For the fourth cooling stop:

(1) Immediately after the fourth stop, accelerate at the maximum rate to 100 km/h (62.1 mph).

(2) Maintain that speed until beginning the recovery performance stops at a distance of 1.5 km (0.93 mi) after the beginning of the fourth cooling stop.

S7.16.1. General information. The recovery performance test is conducted immediately after completion of the brake cooling stops.

S7.16.2. Vehicle conditions. (a) Vehicle load: GVWR only.

(b) Transmission position: In neutral.

S7.16.3. Test conditions and procedures. (a) IBT: Temperature achieved at completion of cooling stops.

(b) Test speed: 100 km/h (62.1 mph).

(c) Pedal force: The average pedal force shall not be greater than the average pedal force recorded during the shortest GVWR cold effectiveness stop.

(d) Wheel lockup: No lockup of any wheel for longer than 0.1 seconds allowed at speeds greater than 15 km/h (9.3 mph).

(e) Number of runs: 2 stops.

(f) Immediately after the fourth cooling stop, accelerate at the maximum rate to 100 km/h (62.1 mph).

(g) Maintain that speed until beginning the first recovery performance stop at a distance of 1.5 km (0.93 mi) after the beginning of the fourth cooling stop.

(h) If the vehicle is incapable of attaining 100 km/h, it is tested at the same speed used for the GVWR cold effectiveness test.

(i) Immediately after completion of the first recovery performance stop accelerate as rapidly as possible to the specified test speed and conduct the second recovery performance stop.

S7.17. Final Inspection. Inspect:

(a) The service brake system for detachment or fracture of any components, such as brake springs and brake shoes or disc pad facings.

(b) The friction surface of the brake, the master cylinder or brake power unit reservoir cover, and seal and filler openings, for leakage of brake fluid or lubricant.

(c) The master cylinder or brake power unit reservoir for compliance with the volume and labeling requirements of S5.4.2 and S5.4.3. In determining the fully applied worn condition, assume that the lining is worn to (1) rivet or bolt heads on riveted or bolted linings or (2) within 0.8 mm (1/32
§ 571.138 Standard No. 138; Tire pressure monitoring systems.

S1 Purpose and scope. This standard specifies performance requirements for tire pressure monitoring systems (TPMSs) to warn drivers of significant under-inflation of tires and the resulting safety problems.

S2 Application. This standard applies to passenger cars, multipurpose passenger vehicles, trucks, and buses that have a gross vehicle weight rating of 4,536 kilograms (10,000 pounds) or less, except those vehicles with dual wheels on an axle, according to the phase-in schedule specified in S7 of this standard.

S3 Definitions. The following definitions apply to this standard:

Lightly loaded vehicle weight means unloaded vehicle weight plus the weight of a mass of 180 kg (396 pounds), including test driver and instrumentation.

Tire pressure monitoring system means a system that detects when one or more of a vehicle’s tires is significantly under-inflated and illuminates a low tire pressure warning telltale.

Vehicle Placard and Tire inflation pressure label mean the sources of information for the vehicle manufacturer’s recommended cold tire inflation pressure pursuant to §571.110 of this Part.

S4 Requirements.

S4.1 General. To the extent provided in S7, each vehicle must be equipped with a tire pressure monitoring system that meets the requirements specified in §4 under the test conditions specified in S5 and the test procedures specified in S6 of this standard.

S4.2 TPMS detection requirements.

The tire pressure monitoring system must:

(a) Illuminate a low tire pressure warning telltale not more than 20 minutes after the inflation pressure in one or more of the vehicle’s tires, up to a total of four tires, is equal to or less than either the pressure 25 percent below the vehicle manufacturer’s recommended cold inflation pressure, or the pressure specified in the 3rd column of Table 1 of this standard for the corresponding type of tire, whichever is higher;

(b) Continue to illuminate the low tire pressure warning telltale as long as the pressure in any of the vehicle’s tires is equal to or less than the pressure specified in S4.2(a), and the ignition locking system is in the “On” (“Run”) position, whether or not the engine is running, or until manually reset in accordance with the vehicle manufacturer’s instructions.

S4.3 Low tire pressure warning telltale.

S4.3.1 Each tire pressure monitoring system must include a low tire pressure warning telltale that:

(a) Is mounted inside the occupant compartment in front of and in clear view of the driver;

(b) Is identified by one of the symbols shown for the “Low Tire Pressure” Telltale in Table 1 of Standard No. 101 (49 CFR 571.101); and

(c) Is illuminated under the conditions specified in S4.2.

S4.3.2 In the case of a telltale that identifies which tire(s) is (are) under-inflated, each tire in the symbol for that telltale must illuminate when the tire it represents is under-inflated to the extent specified in S4.2.

S4.3.3 (a) Except as provided in paragraph (b) of this section, each low tire pressure warning telltale must illuminate as a check of lamp function either when the ignition locking system is activated to the “On” (“Run”) position when the engine is not running, or when the ignition locking system is in a position between “On” (“Run”) and “Start” that is designated
by the manufacturer as a check position.

(b) The low tire pressure warning telltale need not illuminate when a starter interlock is in operation.

§ 571.138  TPMS malfunction.

(a) The vehicle shall be equipped with a tire pressure monitoring system that includes a telltale that provides a warning to the driver not more than 20 minutes after the occurrence of a malfunction that affects the generation or transmission of control or response signals in the vehicle’s tire pressure monitoring system. The vehicle’s TPMS malfunction indicator shall meet the requirements of either § 544(b) or § 544(c).

(b) Dedicated TPMS malfunction telltale. The vehicle meets the requirements of § 544(a) when equipped with a dedicated TPMS malfunction telltale that:

(1) Is mounted inside the occupant compartment in front of and in clear view of the driver;

(2) Is identified by the word “TPMS” as described under the “Tire Pressure Monitoring System Malfunction” Telltale in Table 1 of Standard No. 101 (49 CFR 571.101);

(3) Continues to illuminate the TPMS malfunction telltale under the conditions specified in § 544(a) for as long as the malfunction exists, whenever the ignition locking system is in the “On” (“Run”) position; and

(4) (i) Except as provided in paragraph (ii), each dedicated TPMS malfunction telltale must be activated as a check of lamp function either when the ignition locking system is activated to the “On” (“Run”) position when the engine is not running, or when the ignition locking system is in a position between “On” (“Run”) and “Start” that is designated by the manufacturer as a check position.

(ii) The dedicated TPMS malfunction telltale need not be activated when a starter interlock is in operation.

(c) Combination low tire pressure/TPMS malfunction telltale. The vehicle meets the requirements of § 544(a) when equipped with a combined Low Tire Pressure/TPMS malfunction telltale that:

(1) Meets the requirements of § 542 and § 543; and

(2) Flashes for a period of at least 60 seconds but no longer than 90 seconds upon detection of any condition specified in § 544(a) after the ignition locking system is activated to the “On” (“Run”) position. After each period of prescribed flashing, the telltale must remain continuously illuminated as long as a malfunction exists and the ignition locking system is in the “On” (“Run”) position. This flashing and illumination sequence must be repeated each time the ignition locking system is placed in the “On” (“Run”) position until the situation causing the malfunction has been corrected. Multiple malfunctions occurring during any ignition cycle may, but are not required to, reinitiate the prescribed flashing sequence.

§ 571.138  Written instructions.

(a) Beginning on September 1, 2006, the owner’s manual in each vehicle certified as complying with § 54 must provide an image of the Low Tire Pressure Telltale symbol (and an image of the TPMS Malfunction Telltale warning (“TPMS”), if a dedicated telltale is utilized for this function) with the following statement in English:

Each tire, including the spare (if provided), should be checked monthly when cold and inflated to the inflation pressure recommended by the vehicle manufacturer on the vehicle placard or tire inflation pressure label. (If your vehicle has tires of a different size than the size indicated on the vehicle placard or tire inflation pressure label, you should determine the proper tire inflation pressure for those tires.)

As an added safety feature, your vehicle has been equipped with a tire pressure monitoring system (TPMS) that illuminates a low tire pressure telltale when one or more of your tires is significantly under-inflated. Accordingly, when the low tire pressure telltale illuminates, you should stop and check your tires as soon as possible, and inflate them to the proper pressure. Driving on a significantly under-inflated tire causes the tire to overheat and can lead to tire failure. Under-inflation also reduces fuel efficiency and tire tread life, and may affect the vehicle’s handling and stopping ability.

Please note that the TPMS is not a substitute for proper tire maintenance, and it is the driver’s responsibility to maintain correct tire pressure, even if under-inflation has not reached the level to trigger illumination of the TPMS low tire pressure telltale.

(The following paragraph is required for all vehicles certified to the standard starting on
September 1, 2007 and for vehicles voluntarily equipped with a compliant TPMS MIL before that time.) Your vehicle has also been equipped with a TPMS malfunction indicator to indicate when the system is not operating properly. (For vehicles with a dedicated MIL telltale, add the following statement: The TPMS malfunction indicator is provided by a separate telltale, which displays the symbol “TPMS” when illuminated.) (For vehicles with a combined low tire pressure/MIL telltale, add the following statement: The TPMS malfunction indicator is combined with the low tire pressure telltale. When the system detects a malfunction, the telltale will flash for approximately one minute and then remain continuously illuminated. This sequence will continue upon subsequent vehicle start-ups as long as the malfunction exists.) When the malfunction indicator is illuminated, the system may not be able to detect or signal low tire pressure as intended. TPMS malfunctions may occur for a variety of reasons, including the installation of replacement or alternate tires or wheels on the vehicle that prevent the TPMS from functioning properly. Always check the TPMS malfunction telltale after replacing one or more tires or wheels on your vehicle to ensure that the replacement or alternate tires and wheels allow the TPMS to continue to function properly.

(b) The owner’s manual may include additional information about the time for the TPMS telltale(s) to extinguish once the low tire pressure condition or the malfunction is corrected. It may also include additional information about the significance of the low tire pressure warning telltale illuminating, a description of corrective action to be undertaken, whether the tire pressure monitoring system functions with the vehicle’s spare tire (if provided), and how to use a reset button, if one is provided.

(c) If a vehicle does not come with an owner’s manual, the required information shall be provided in writing to the first purchaser of the vehicle.

S5 Test conditions.

S5.1 Ambient temperature. The ambient temperature is between 0 °C (32 °F) and 40 °C (104 °F).

S5.2 Road test surface. Compliance testing is conducted on any portion of the Southern Loop of the Treadwear Test Course defined in Appendix A and Figure 2 of section 575.104 of this chapter. The road surface is dry during testing.

S5.3 Vehicle conditions.

S5.3.1 Test weight. The vehicle may be tested at any weight between its lightly loaded vehicle weight and its gross vehicle weight rating (GVWR) without exceeding any of its gross axle weight ratings.

S5.3.2 Vehicle speed. The vehicle’s TPMS is calibrated and tested at speeds between 50 km/h (31.1 mph) and 100 km/h (62.2 mph). For vehicles equipped with cruise control, cruise control is not to be engaged during testing.

S5.3.3 Rim position. The vehicle’s tires may be positioned at any wheel position, consistent with any related instructions or limitations in the vehicle owner’s manual.

S5.3.4 Stationary location. The vehicle’s tires are shaded from direct sun when the vehicle is parked.

S5.3.5 Brake pedal application. Driving time shall not accumulate during service brake application.

S5.3.6 Range of conditions or test parameters. Whenever a range of conditions or test parameters is specified in this standard, the vehicle must meet applicable requirements when tested at any point within the range.

S5.3.7 Tires. The vehicle is tested with the tires installed on the vehicle at the time of initial vehicle sale, excluding the spare tire (if provided). However, the spare tire may be utilized for TPMS malfunction testing purposes.

S6 Test procedures.

(a) Inflate the vehicle’s tires to the cold tire inflation pressure(s) provided on the vehicle placard or the tire inflation pressure label.

(b) With the vehicle stationary and the ignition locking system in the “Lock” or “Off” position, activate the ignition locking system to the “On” (“Run”) position or, where applicable, the appropriate position for the lamp check. The tire pressure monitoring system must perform a check of lamp function for the low tire pressure telltale as specified in paragraph S4.3.3 of this standard. If the vehicle is equipped with a separate TPMS malfunction telltale, the tire pressure monitoring system also must perform a check of lamp function as specified in paragraph S4.4(b)(4) of this standard.
§ 571.138  
49 CFR Ch. V (10–1–08 Edition)  

(c) If applicable, set or reset the tire pressure monitoring system in accordance with the instructions in the vehicle owner’s manual.

(d) System calibration/learning phase.

(1) Drive the vehicle for up to 15 minutes of cumulative time (not necessarily continuously) along any portion of the test course.

(2) Reverse direction on the course and drive the vehicle for an additional period of time for a total cumulative time of 20 minutes (including the time in §6(d)(1), and not necessarily continuously).

(e) Stop the vehicle and deflate any combination of one to four tires until the deflated tire(s) is (are) at 7 kPa (1 psi) below the inflation pressure at which the tire pressure monitoring system is required to illuminate the low tire pressure warning telltale.

(f) System detection phase.

(1) Within 5 minutes of reducing the inflation pressure in the tire(s), drive the vehicle for up to 10–15 minutes of cumulative time (not necessarily continuously) along any portion of the test course.

(2) Reverse direction on the course and drive the vehicle for an additional period of time for a total cumulative time of 20 minutes (including the time in §6(f)(1), and not necessarily continuously).

(3) The sum of the total cumulative drive time under paragraphs §6(f)(1) and (2) shall be the lesser of 20 minutes or the time at which the low tire pressure telltale illuminates.

(4) If the low tire pressure telltale did not illuminate, discontinue the test.

(g) If the low tire pressure telltale illuminated during the procedure in paragraph §6(f), deactivate the ignition locking system to the “Off” or “Lock” position. After a 5-minute period, activate the vehicle’s ignition locking system to the “On” (“Run”) position. The telltale must illuminate and remain illuminated as long as the ignition locking system is in the “On” (“Run”) position.

(h) Keep the vehicle stationary for a period of up to one hour with the engine off.

(i) Inflate all of the vehicle’s tires to the same inflation pressure used in paragraph §6(a). If the vehicle’s tire pressure monitoring system has a manual reset feature, reset the system in accordance with the instructions specified in the vehicle owner’s manual. Determine whether the telltale has extinguished. If necessary, drive the vehicle until the telltale has been extinguished.

(j) The test may be repeated, using the test procedures in paragraphs §6(a)–(b) and §6(d)–(i), with any one, two, three, or four of the tires on the vehicle under-inflated.

(k) Simulate one TPMS malfunction by disconnecting the power source to any TPMS component, disconnecting any electrical connection between TPMS components, or installing a tire or wheel on the vehicle that is incompatible with the TPMS. When simulating a TPMS malfunction, the electrical connections for the telltale lamps are not to be disconnected.

(l) TPMS malfunction detection.

(1) Drive the vehicle for up to 15 minutes of cumulative time (not necessarily continuously) along any portion of the test course.

(2) Reverse direction on the course and drive the vehicle for an additional period of time for a total cumulative time of 20 minutes (including the time in §6(l)(1), and not necessarily continuously).

(3) The sum of the total cumulative drive time under paragraphs §6(l)(1) and (2) shall be the lesser of 20 minutes or the time at which the TPMS malfunction telltale illuminates.

(4) If the TPMS malfunction indicator did not illuminate in accordance with paragraph §4.4, as required, discontinue the test.

(m) If the TPMS malfunction indicator illuminated during the procedure in paragraph §6(l), deactivate the ignition locking system to the “Off” or “Lock” position. After a 5-minute period, activate the vehicle’s ignition locking system to the “On” (“Run”) position. The TPMS malfunction indicator must again signal a malfunction and remain illuminated as long as the ignition locking system is in the “On” (“Run”) position.

(n) Restore the TPMS to normal operation. If necessary, drive the vehicle until the telltale has extinguished.
(o) The test may be repeated using the test procedures in paragraphs S6(k)–(n), with each such test limited to simulation of a single malfunction.

S7 Phase-in schedule.

S7.1 Vehicles manufactured on or after October 5, 2005, and before September 1, 2006. For vehicles manufactured on or after October 5, 2005, and before September 1, 2006, the number of vehicles complying with this standard (except for the provisions of S4.4 unless the manufacturer elects to also certify to those provisions) must not be less than 20 percent of:

(a) The manufacturer’s average annual production of vehicles manufactured on or after September 1, 2002, and before October 5, 2005; or

(b) The manufacturer’s production on or after October 5, 2005, and before September 1, 2006.

S7.2 Vehicles manufactured on or after September 1, 2006, and before September 1, 2007. For vehicles manufactured on or after September 1, 2006, and before September 1, 2007, the number of vehicles complying with this standard (except for the provisions of S4.4 unless the manufacturer elects to also certify to those provisions) must not be less than 70 percent of:

(a) The manufacturer’s average annual production of vehicles manufactured on or after September 1, 2003, and before September 1, 2006; or

(b) The manufacturer’s production on or after September 1, 2006, and before September 1, 2007.

S7.3 Vehicles manufactured on or after September 1, 2007. Except as provided in S7.7, all vehicles manufactured on or after September 1, 2007 must comply with all requirements of this standard.

S7.4 Calculation of complying vehicles.

(a) Carry-Forward Credits. For purposes of complying with S7.1, a manufacturer may count a vehicle if it is:

(i) Certified as complying with this standard and is manufactured on or before April 8, 2005; and

(ii) Not counted toward compliance with S7.1; or

(ii) Is manufactured on or after September 1, 2006, but before September 1, 2007.

(c) Carry-Backward Credits. At the vehicle manufacturer’s option, for purposes of complying with S7.1, a manufacturer may count a vehicle it plans to manufacture and to certify as complying with this standard that will be produced on or after September 1, 2006 but before September 1, 2007. However, a vehicle counted toward compliance with S7.1 may not be counted toward compliance with S7.2. If the vehicle manufacturer decides to exercise the option for carry-backward credits, the manufacturer must indicate this in its report for the production period corresponding to S7.1 filed pursuant to 49 CFR 585.66. The vehicles are counted in fulfillment of the requirements of S7.1, subject to actually being produced in compliance with this standard during the specified time period and not being counted toward the requirements of S7.2.

S7.5 Vehicles produced by more than one manufacturer.

S7.5.1 For the purpose of calculating average annual production of vehicles for each manufacturer and the number of vehicles manufactured by each manufacturer under S7.1 through S7.3, a vehicle produced by more than one manufacturer must be attributed to a single manufacturer as follows, subject to S7.5.2:

(a) A vehicle that is imported must be attributed to the importer.

(b) A vehicle manufactured in the United States by more than one manufacturer, one of which also markets the vehicle, must be attributed to the manufacturer that markets the vehicle.

S7.5.2 A vehicle produced by more than one manufacturer must be attributed to any one of the vehicle’s manufacturers specified by an express written contract, reported to the National Highway Traffic Safety Administration under 49 CFR Part 585, between the manufacturer so specified and the manufacturer to which the vehicle would otherwise be attributed under S7.5.1.

S7.6 Small volume manufacturers. Vehicles manufactured by a manufacturer that produces fewer than 5,000 vehicles
for sale in the United States during the period of September 1, 2005 to August 31, 2006, or the period from September 1, 2006 to August 31, 2007, are not subject to the corresponding requirements of §7.1, §7.2, and §7.4.

§7.7 Final-stage manufacturers and alterers. Vehicles that are manufactured in two or more stages or that are altered (within the meaning of 49 CFR 567.7) after having previously been certified in accordance with Part 567 of this chapter are not subject to the requirements of §7.1 through §7.4. Instead, vehicles that are manufactured in two or more stages or that are altered must comply with this standard beginning on September 1, 2008.

[70 FR 18187, Apr. 8, 2005, as amended at 70 FR 38025, July 12, 2007]

§§71.139 Standard No. 139: New pneumatic radial tires for light vehicles.

S1. Scope and purpose. This standard specifies tire dimensions, test requirements, labeling requirements, and defines tire load ratings.

S2 Application and Incorporation by Reference.

S2.1 Application. This standard applies to new pneumatic radial tires for use on motor vehicles (other than motorcycles and low speed vehicles) that have a gross vehicle weight rating (GVWR) of 10,000 pounds or less and that were manufactured after 1975. This standard does not apply to special tires (ST) for trailers in highway service, tires for use on farm implements (FI) in agricultural service with intermittent highway use, tires with rim diameters of 8 inches and below, or T-type temporary use spare tires with radial construction.

S2.2 Incorporation by reference. ASTM F-1805-00, Standard Test Method for Single Wheel Driving Traction in a Straight Line on Snow- and Ice-Covered Surfaces is incorporated by reference in S3 of this section. The Director of the Federal Register has approved the incorporation by reference of this material in accordance with 5 U.S.C. 552(a) and 1 CFR Part 51. A copy of ASTM F-1805-00 may be obtained from the ASTM Web site http://www.astm.org/ or by contacting ASTM, 100 Barr Harbor Drive, West Conshohocken, PA 19428-2959. A copy of ASTM F-1805-00 may be obtained from the NHTSA docket at Docket No. 2005-23439, or at the National Archives and Records Administration (NARA). For information on the availability of this material at NARA, call 202-741-6030, or go to: http://www.archives.gov/federal_register/code_of_federal_regulations/ibr_locations.html.

S3 Definitions.

Bead means the part of the tire that is made of steel wires, wrapped or reinforced by ply cords and that is shaped to fit the rim.

Bead separation means a breakdown of the bond between components in the bead.

Bias ply tire means a pneumatic tire in which the ply cords that extend to the beads are laid at alternate angles substantially less than 90 degrees to the centerline of the tread.

Carcass means the tire structure, except tread and sidewall rubber which, when inflated, bears the load.

Chunking means the breaking away of pieces of the tread or sidewall.
Cord means the strands forming the plies in the tire.

Cord separation means the parting of cords from adjacent rubber compounds.

Cracking means any parting within the tread, sidewall, or inner liner of the tire extending to cord material.

Extra load tire means a tire designed to operate at higher loads and higher inflation pressure than the corresponding standard tire.

Groove means the space between two adjacent tread ribs.

Innerliner means the layer(s) forming the inside surface of a tubeless tire that contains the inflating medium within the tire.

Innerliner separation means the parting of the innerliner from cord material in the carcass.

Light truck (LT) tire means a tire designated by its manufacturer as primarily intended for use on lightweight trucks or multipurpose passenger vehicles.

Load rating means the maximum load that a tire is rated to carry for a given inflation pressure.

Maximum load rating means the load rating for a tire at the maximum permissible inflation pressure for that tire.

Maximum permissible inflation pressure means the maximum cold inflation pressure to which a tire may be inflated.

Measuring rim means the rim on which a tire is fitted for physical dimension requirements.

Open splice means any parting at any junction of tread, sidewall, or innerliner that extends to cord material.

Outer diameter means the overall diameter of an inflated new tire.

Overall width means the linear distance between the exteriors of the sidewalls of an inflated tire, including elevations due to labeling, decorations, or protective bands or ribs.

Passenger car tire means a tire intended for use on passenger cars, multipurpose passenger vehicles, and trucks, that have a gross vehicle weight rating (GVWR) of 10,000 pounds or less.

Ply means a layer of rubber-coated parallel cords.

Ply separation means a parting of rubber compound between adjacent plies.

Pneumatic tire means a mechanical device made of rubber, chemicals, fabric and steel or other materials, that, when mounted on an automotive wheel, provides the traction and contains the gas or fluid that sustains the load.

Radial ply tire means a pneumatic tire in which the ply cords that extend to the beads are laid at substantially 90 degrees to the centerline of the tread.

Reinforced tire means a tire designed to operate at higher loads and at higher inflation pressures than the corresponding standard tire.

Rim means a metal support for a tire or a tire and tube assembly upon which the tire beads are seated.

Section width means the linear distance between the exteriors of the sidewalls of an inflated tire, excluding elevations due to labeling, decoration, or protective bands.

Sidewall means that portion of a tire between the tread and bead.

Sidewall separation means the parting of the rubber compound from the cord material in the sidewall.

Test rim means the rim on which a tire is fitted for testing, and may be any rim listed as appropriate for use with that tire.

Tread means that portion of a tire that comes into contact with the road.

Tread rib means a tread section running circumferentially around a tire.

Tread separation means pulling away of the tread from the tire carcass.

Treadwear indicators (TWI) means the projections within the principal grooves designed to give a visual indication of the degrees of wear of the tread.

Wheel-holding fixture means the fixture used to hold the wheel and tire assembly securely during testing.

§ 571.139 Tire and rim matching information.

S4. Each manufacturer of tires must ensure that a listing of the rims that may be used with each tire that it produces is provided to the public in accordance with S4.1.1 and S4.1.2.

S4.1 Each rim listing for a tire must include dimensional specifications and a diagram of the rim and must be in one of the following forms:
§ 571.139  49 CFR Ch. V (10–1–08 Edition)

(a) Listed by manufacturer name or brand name in a document furnished to dealers of the manufacturer’s tires, to any person upon request, and in duplicate to: Docket Section, National Highway Traffic Safety Administration, 400 Seventh Street, SW., Washington, DC 20590; or
(b) Contained in publications, current at the date of manufacture of the tire or any later date, of at least one of the following organizations:
(1) The Tire and Rim Association.
(2) The European Tyre and Rim Technical Organization.
(3) Japan Automobile ‘Tire Manufacturers’ Association, Inc.
(4) Tyre & Rim Association of Australia.
(5) Associacao Latino Americana de Pneus e Aros (Brazil).
(6) South African Bureau of Standards.

S4.1.2 A listing compiled in accordance with paragraph (a) of S4.1.1 need not include dimensional specifications or a diagram of a rim whose dimensional specifications and diagram are contained in a listing published in accordance with paragraph (b) of S4.1.1.

S4.2. Information contained in a publication specified in S4.1.1(b) that lists general categories of tires and rims by size designation, type of construction, and/or intended use, is considered to be manufacturer’s information required by S4.1 for the listed tires, unless the publication itself or specific information provided according to S4.1(a) indicates otherwise.

S5. General requirements

S5.1. Size and construction. Each tire shall fit each rim specified for its size designation in accordance with S4.1.

S5.2. Performance requirements. Each tire shall conform to each of the following:
(a) It shall meet the requirements specified in S6 for its tire size designation, type, and maximum permissible inflation pressure.
(b) It shall meet each of the applicable requirements set forth in paragraphs (c) and (d) of this S5.2, when mounted on a model rim assembly corresponding to any rim designated by the tire manufacturer for use with the tire in accordance with S4.
(c) Its maximum permissible inflation pressure shall be 240, 280, 300, 340, or 350 kPa.
(d) Its load rating shall be that specified either in a submission made by an individual manufacturer, pursuant to S4, or in one of the publications described in S4 for its size designation, type and each appropriate inflation pressure. If the maximum load rating for a particular tire size is shown in more than one of the publications described in S4, each tire of that size designation shall have a maximum load rating that is not less than the published maximum load rating, or if there are differing maximum load ratings for the same tire size designation, not less then the lowest published maximum load rating.

S5.3. Test sample. For the tests specified in S6, use:
(a) One tire for high speed;
(b) Another tire for endurance and low inflation pressure performance; and
(c) A third tire for physical dimensions, resistance to bead unseating, and strength, in sequence.

S5.4. Treadwear indicators. Except in the case of tires with a 12-inch or smaller rim diameter, each tire shall have not less than six treadwear indicators spaced approximately equally around the circumference of the tire that enable a person inspecting the tire to determine visually whether the tire has worn to a tread depth of one sixteenth of an inch. Tires with 12-inch or smaller rim diameter shall have not less than three such treadwear indicators.

S5.5 Tire markings. Except as specified in paragraphs (a) through (i) of S5.5, each tire must be marked on each sidewall with the information specified in S5.5(a) through (d) and on one sidewall with the information specified in S5.5(e) through (i) according to the phase-in schedule specified in S7 of this standard. The markings must be placed between the maximum section width and the bead on at least one sidewall, unless the maximum section width of the tire is located in an area that is not more than one-fourth of the distance from the bead to the shoulder of the tire. If the maximum section width falls within that area, those markings
must appear between the bead and a point one-half the distance from the bead to the shoulder of the tire, on at least one sidewall. The markings must be in letters and numerals not less than 0.078 inches high and raised above or sunk below the tire surface not less than 0.015 inches.

§5.5.1 Tire identification number.
(a) Tires manufactured before September 1, 2009. Each tire must be labeled with the tire identification number required by 49 CFR part 574 on a sidewall of the tire. Except for retreaded tires, either the tire identification number or a partial tire identification number, containing all characters in the tire identification number, except for the date code and, at the discretion of the manufacturer, any optional code, must be labeled on the other sidewall of the tire.

(b) Tires manufactured on or after September 1, 2009. Each tire must be labeled with the tire identification number required by 49 CFR part 574 on the intended outboard sidewall of the tire. Except for retreaded tires, either the tire identification number or a partial tire identification number, containing all characters in the tire identification number, except for the date code and, at the discretion of the manufacturer, any optional code, must be labeled on the other sidewall of the tire. Except for retreaded tires, if a tire does not have an intended outboard sidewall, the tire must be labeled with the tire identification number required by 49 CFR part 574 on one sidewall and with either the tire identification number or a partial tire identification number, containing all characters in the tire identification number except for the date code and, at the discretion of the manufacturer, any optional code, on the other sidewall.

§5.5.2 [Reserved]

§5.5.3 Each tire must be labeled with the name of the manufacturer, or brand name and number assigned to the manufacturer in the manner specified in 49 CFR part 574.

§5.5.4 For passenger car tires, if the maximum inflation pressure of a tire is 240, 280, 300, 340, or 350 kPa, then:
(a) Each marking of that inflation pressure pursuant to §5.5(c) must be followed in parenthesis by the equivalent psi, rounded to the next higher whole number; and
(b) Each marking of the tire’s maximum load rating pursuant to §5.5(d) in kilograms must be followed in parenthesis by the equivalent load rating in pounds, rounded to the nearest whole number.

§5.5.5 If the maximum inflation pressure of a tire is 420 kPa (60 psi), the tire must have permanently molded into or onto both sidewalls, in letters and numerals not less than ½ inch high, the words “Inflate to 60 psi” or “Inflate to 420 kPa (60 psi).” On both sidewalls, the words must be positioned in an area between the tire shoulder and the bead of the tire. However, the words must be also positioned on the tire so that they are not obstructed by the flange of any rim designated for use with that tire in this standard or in Standard No. 110 (§571.110 of this part).

§5.5.6 For LT tires, the maximum permissible inflation pressure shown must be the inflation pressure that corresponds to the maximum load of the tire for the tire size as specified in one of the publications described in S4.1.1(b) of §571.139. At the manufacturer’s option, the shown inflation pressure may be as much as 10 psi (69 kPa) greater than the inflation pressure corresponding to the specified maximum load.

§6. Test procedures, conditions and performance requirements. Each tire shall meet all of the applicable requirements of this section when tested according to the conditions and procedures set forth in §5 and §6.1 through §6.7.

§6.1. Tire dimensions

§6.1.1 Test conditions and procedures.
§6.1.1.1 Tire Preparation.

§6.1.1.1.1 Mount the tire on the measuring rim specified by the tire manufacturer or in one of the publications listed in §4.1.1.

§6.1.1.1.2 For passenger car tires, inflate to the pressure specified in the following table:

<table>
<thead>
<tr>
<th>Inflation pressure (kPa)</th>
<th>Standard</th>
<th>Reinforced</th>
</tr>
</thead>
<tbody>
<tr>
<td>180</td>
<td></td>
<td>220</td>
</tr>
</tbody>
</table>
§ 571.139 49 CFR Ch. V (10–1–08 Edition)

S6.1.1.1.3 In the case of a LT tire, inflate it to the pressure at maximum load as labeled on sidewall.

S6.1.1.1.4 Condition the assembly at an ambient room temperature of 20 °C to 30 °C for not less than 24 hours.

S6.1.1.1.5 Readjust the tire pressure to that specified in S6.1.1.1.2.

S6.1.2 Performance Requirements. The actual section width and overall width for each tire measured in accordance with S6.1.2 shall not exceed the section width specified in a submission made by an individual manufacturer, pursuant to S4.1.1(a) or in one of the publications described in S4.1.1(b) for its size designation and type by more than:

(a) (For tires with a maximum permissible inflation pressure of 32, 36, or 40 psi) 7 percent, or
(b) (For tires with a maximum permissible inflation pressure of 240, 280, 300, 340 or 350 kPa) 7 percent or 10 mm (0.4 inches), whichever is larger.

S6.2 High Speed Performance

S6.2.1 Test conditions and procedures.

S6.2.1.1 Preparation of tire.

S6.2.1.1.1 Mount the tire on a test rim and inflate it to the pressure specified for the tire in the following table:

<table>
<thead>
<tr>

<td>230</td>
</tr>
</tbody>
</table>

S6.2.1.2 Condition the assembly at 32 to 38 °C for not less than 3 hours.

S6.2.1.3 Before or after mounting the assembly on a test axle, readjust the tire pressure to that specified in S6.2.1.1.1.

S6.2.1.2 Test procedure.

S6.2.1.2.1 Press the assembly against the outer face of a test drum with a diameter of 1.70 m ± 1%.

S6.2.1.2.2 Apply to the test axle a load equal to 85% of the tire’s maximum load carrying capacity.

S6.2.1.2.3 Break-in the tire by running it for 2 hours at 80 km/h.

S6.2.1.2.4 Allow tire to cool to 38 °C and readjust inflation pressure to applicable pressure in 6.2.1.1 immediately before the test.

S6.2.1.2.5 Throughout the test, the inflation pressure is not corrected and the test load is maintained at the value applied in S6.2.1.2.2.

S6.2.1.2.6 During the test, the ambient temperature, measured at a distance of not less than 150 mm and not more than 1 m from the tire, is maintained at not less than 32 °C or more than 38 °C.

S6.2.1.2.7 The test is conducted, continuously and uninterrupted, for ninety minutes through three thirty-minute consecutive test stages at the following speeds: 140, 150, and 160 km/h.

S6.2.1.2.8 Allow the tire to cool for between 15 minutes and 25 minutes. Measure its inflation pressure. Then, deflate the tire, remove it from the test rim, and inspect it for the conditions specified in S6.2.2(a).

S6.2.2 Performance requirements. When the tire is tested in accordance with S6.2.1:

(a) There shall be no visual evidence of tread, sidewall, ply, cord, innerliner, belt or bead separation, chunking, open splices, cracking, or broken cords.

(b) The tire pressure, when measured at any time between 15 minutes and 25 minutes after the end of the test, shall not be less than 95% of the initial pressure specified in S6.2.1.1.
§ 571.139  Tire Endurance

S6.3.1 Test conditions and procedures.
S6.3.1.1 Preparation of Tire.

Mount the tire on a test rim and inflate it to the pressure specified for the tire in the following table:

<table>
<thead>
<tr>
<th>Tire application</th>
<th>Test pressure (kPa)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Passenger car tires</td>

S6.3.1.2 Condition the assembly at 32 to 38 °C for not less than 3 hours.
S6.3.1.3 Readjust the pressure to the value specified in S6.3.1.1 immediately before testing.
S6.3.1.2 Test Procedure.

S6.3.1.2.1 Mount the assembly on a test axle and press it against the outer face of a smooth wheel having a diameter of 1.70 m ± 1%.
S6.3.1.2.2 During the test, the ambient temperature, at a distance of not less than 150 mm and not more than 1 m from the tire, is maintained at not less than 32 °C or more than 38 °C.
S6.3.1.2.3 Conduct the test, without interruptions, at the test speed of not less than 120 km/h with loads and test periods not less than those shown in the following table. For snow tires, conduct the test at not less than 110 km/h.

S6.3.1.2.4 Throughout the test, the inflation pressure is not corrected and the test loads are maintained at the value corresponding to each test period, as shown in the table in S6.3.1.2.3.
S6.3.1.2.5 Allow the tire to cool for between 15 minutes and 25 minutes after running the tire for the time specified in the table in S6.3.1.2.3. Measure its inflation pressure. Inspect the tire externally on the test rim for the conditions specified in S6.3.2(a).
S6.3.2 Performance requirements.

When the tire is tested in accordance with S6.3.1:
(a) There shall be no visual evidence of tread, sidewall, ply, cord, belt or bead separation, chunking, open splices, cracking or broken cords.
(b) The tire pressure, when measured at any time between 15 minutes and 25 minutes after the end of the test, shall not be less than 95% of the initial pressure specified in S6.3.1.1.

S6.4 Low Inflation Pressure Performance

S6.4.1 Test conditions and procedures.
S6.4.1.1 Preparation of tire.

This test is conducted following completion of the tire endurance test using the same tire and rim assembly tested in accordance with S6.3 with the tire deflated to the following appropriate pressure:

S6.4.1.2 After the tire is deflated to the appropriate test pressure in S6.4.1.1 at the completion of the endurance test, condition the assembly at 32 to 38 °C for not less than 2 hours.
S6.4.1.3 Before or after mounting the assembly on a test axle, readjust the tire pressure to that specified in S6.4.1.1.
S6.4.1.2 Test procedure.

S6.4.1.2.1 The test is conducted for ninety minutes at the end of the test specified in S6.3, continuous and uninterrupted, at a speed of 120 km/h (75 mph). For snow tires, conduct the test at not less than 110 km/h.
§ 571.201 Standard No. 201; Occupant protection in interior impact

S1. Purpose and scope. This standard specifies requirements to afford impact protection for occupants.

S2. Application. This standard applies to passenger cars and to multipurpose passenger vehicles, trucks, and buses with a GVWR of 4,536 kilograms or less, except that the requirements of §6 do not apply to buses with a GVWR of more than 3,860 kilograms.

S3. Definitions.

A-pillar means any pillar that is entirely forward of a transverse vertical plane passing through the seating reference point of the driver’s seat.

Ambulance means a motor vehicle designed exclusively for the purpose of emergency medical care, as evidenced by the presence of a passenger compartment to accommodate emergency medical personnel, one or more patients on litters or cots, and equipment and supplies for emergency care at a location or during transport.

B-pillar means the forwardmost pillar on each side of the vehicle that is, in

S6.4.1.2.2 Press the assembly against the outer face of a test drum with a diameter of 1.70 m + 1%.

S6.4.1.2.3 Apply to the test axle a load equal to 100% of the tire’s maximum load carrying capacity.

S6.4.1.2.4 Throughout the test, the inflation pressure is not corrected and the test load is maintained at the initial level.

S6.4.1.2.5 During the test, the ambient temperature, at a distance of not less than 150 mm and not more than 1 m from the tire, is maintained at not less than 32 °C or more than 38 °C.

S6.4.1.2.6 Allow the tire to cool for between 15 minutes and 25 minutes. Measure its inflation pressure. Then, deflate the tire, remove it from the test rim, and inspect it for the conditions specified in S6.4.2 (a).

S6.4.2 Performance requirements.

When the tire is tested in accordance with S6.4.1:

(a) There shall be no visual evidence of tread, sidewall, ply, cord, innerliner, belt or bead separation, chunking, open splices, cracking, or broken cords, and

(b) The tire pressure, when measured at any time between 15 minutes and 25 minutes after the end of the test, shall not be less than 95% of the initial pressure specified in S6.4.1.1.

S6.5 Tire strength.

S6.5.1 Tire strength for passenger car tires. Each tire shall comply with the requirements of S5.3 of §571.109.

S6.5.2 Tire strength for LT tires. Each tire shall comply with the requirements of S7.3 of §571.119.

S6.6 Tubeless tire bead unseating resistance. Each tire shall comply with the requirements of S5.2 of §571.109. For light truck tires, the maximum permissible inflation pressure to be used for the bead unseating test is as follows:

Load Range C ........................ 260 kPa.
Load Range D ........................ 340 kPa.
Load Range E ........................ 410 kPa.

For light truck tires with a nominal cross section greater than 295 mm (11.5 inches), the maximum permissible inflation pressure to be used for the bead unseating test is as follows:

Load Range C ........................ 190 kPa.
Load Range D ........................ 260 kPa.
Load Range E ........................ 340 kPa.

S7. Phase-in schedule for tire markings.

S7.1 Tires manufactured on or after September 1, 2005 and before September 1, 2006. For tires manufactured on or after September 1, 2005 and before September 1, 2006, the number of tires complying with S4, S5.5, S5.5.1, S5.5.2, S5.5.3, S5.5.4, S5.5.5, and S5.5.6 of this standard must be equal to not less than 40% of the manufacturer’s production during that period.

S7.2 Tires manufactured on or after September 1, 2006 and before September 1, 2007. For tires manufactured on or after September 1, 2006 and before September 1, 2007, the number of tires complying with S4, S5.5, S5.5.1, S5.5.2, S5.5.3, S5.5.4, S5.5.5, and S5.5.6 of this standard must be equal to not less than 70% of the manufacturer’s production during that period.

S7.3 Tires manufactured on or after September 1, 2007. Each tire must comply with S4, S5.5, S5.5.1, S5.5.2, S5.5.3, S5.5.4, S5.5.5, and S5.5.6 of this standard.

whole or in part, rearward of a transverse vertical plane passing through the seating reference point of the driver's seat, unless:

1. There is only one pillar rearward of that plane and it is also a rearmost pillar; or

2. There is a door frame rearward of the A-pillar and forward of any other pillar or rearmost pillar.

**Brace** means a fixed diagonal structural member in an open body vehicle that is used to brace the roll-bar and that connects the roll-bar to the main body of the vehicle structure.

**Convertible** means a vehicle whose A-pillars are not joined with the B-pillars (or rearmost pillars) by a fixed, rigid structural member.

**Convertible roof frame** means the frame of a convertible roof.

**Convertible roof linkage mechanism** means any anchorage, fastener, or device necessary to deploy a convertible roof frame.

**Daylight opening** means, for openings on the side of the vehicle, other than a door opening, the locus of all points where a horizontal line, perpendicular to the vehicle longitudinal centerline, is tangent to the periphery of the opening. For openings on the front and rear of the vehicle, other than a door opening, **daylight opening** means the locus of all points where a horizontal line, parallel to the vehicle longitudinal centerline, is tangent to the periphery of the opening. If the horizontal line is tangent to the periphery at more than one point at any location, the most inboard point is used to determine the daylight opening.

**Door frame** means the rearmost perimeter structure, including trim but excluding glass, of the forward door and the forwardmost perimeter structure, including trim but excluding glass, of the rear door of a pair of adjacent side doors that:

1. Have opposing hinges;
2. Latch together without engaging or contacting an intervening pillar;
3. Are forward of any pillar other than the A-pillar on the same side of the vehicle; and

**Door opening** means, for door openings on the side of the vehicle, the locus of all points where a horizontal line, perpendicular to the vehicle longitudinal centerline, is tangent to the periphery of the side door opening. For door openings on the back end of the vehicle, **door opening** means the locus of all points where a horizontal line, parallel to the vehicle longitudinal centerline, is tangent to the periphery of the back door opening. If the horizontal line is tangent to the periphery at more than one point at any location, the most inboard point is the door opening.

**Dynamically deployed upper interior head protection system** means a protective device or devices which are integrated into a vehicle and which, when activated by an impact, provide, through means requiring no action from occupants, protection against head impacts with upper interior structures and components of the vehicle in crashes.

**Forehead impact zone** means the part of the free motion headform surface area that is determined in accordance with the procedure set forth in §8.10.

**Free motion headform** means a test device which conforms to the specifications of part 572, subpart L of this chapter.

**Interior rear quarter panel** means a vehicle interior component located between the rear edge of the side door frame, the front edge of the rearmost seat back, and the daylight opening.

**Mid-sagittal plane of a dummy** means a longitudinal vertical plane passing through the seating reference point of a designated seating position.

**Other door frame** means the rearmost perimeter structure, including trim but excluding glass, of the forward door and the forwardmost perimeter structure, including trim but excluding glass, of the rear door of a pair of adjacent side doors that:

1. Have opposing hinges;
2. Latch together without engaging or contacting an intervening pillar; and
3. Are rearward of the B-pillar.

**Other pillar** means any pillar which is not an A-pillar, a B-pillar, or a rearmost pillar.

**Pillar** means any structure, excluding glazing and the vertical portion of door
§ 571.201  49 CFR Ch. V (10–1–08 Edition)

window frames, but including accompanying moldings, attached components such as safety belt anchorages and coat hooks, which:

(1) Supports either a roof or any other structure (such as a roll-bar) that is above the driver’s head, or

(2) Is located along the side edge of a window.

Roll-bar means a fixed overhead structural member, including its vertical support structure, that extends from the left to the right side of the passenger compartment of any open body vehicles and convertibles. It does not include a header.

Seat belt anchorage means any component involved in transferring seat belt loads to the vehicle structure, including, but not limited to, the attachment hardware, but excluding webbing or straps, seat frames, seat pedestals, and the vehicle structure itself, whose failure causes separation of the belt from the vehicle structure.

Seat belt mounting structure means:

(a) A vehicle body or frame component, including trim, that incorporates an upper seat belt anchorage conforming to the requirements of §4.2.1 and §4.3.2 of 49 CFR 571.210, that is located rearward of the rearmost outboard designated seating position, and that extends above a horizontal plane 660 mm above the seating reference point (SgRP) of that seating position; and

(b) A vehicle body or frame component, including trim, that incorporates an upper seat belt anchorage conforming to the requirements of §4.2.1 and §4.3.2 of 49 CFR 571.210, that is located forward of the rearmost outboard designated seating position, and that extends above a horizontal plane 460 mm above the SgRP of that seating position located rearward of the anchorage.

(c) The seat belt mounting structure is not a pillar, roll bar, brace or stiffener, side rail, seat, interior rear quarter panel, or part of the roof.

Sliding door track means a track structure along the upper edge of a side door opening that secures the door in the closed position and guides the door when moving to and from the open position.

Stiffener means a fixed overhead structural member that connects one roll-bar to another roll-bar or to a header of any open body vehicle or convertible.

Upper roof means the area of the vehicle interior that is determined in accordance with the procedure set forth in §8.15.

Windshield trim means molding of any material between the windshield glazing and the exterior roof surface, including material that covers a part of either the windshield glazing or exterior roof surface.

S4 Requirements

S4.1 Except as provided in S4.2, each vehicle shall comply with either:

(a) The requirements specified in S5, or,

(b) The requirements specified in S5 and S6.

S4.2 Vehicles manufactured on or after September 1, 1998 shall comply with the requirements of S5 and S6.

S5 Requirements for instrument panels, seat backs, interior compartment doors, sun visors, and armrests. Each vehicle shall comply with the requirements specified in S5.1 through S5.5.2.

S5.1 Instrument panels. Except as provided in S5.1.1, when that area of the instrument panel that is within the head impact area is impacted in accordance with S5.1.2 by a 6.8 kilogram, 165 mm diameter head form at—

(a) A relative velocity of 24 kilometers per hour for all vehicles except those specified in paragraph (b) of this section.

(b) A relative velocity of 19 kilometers per hour for vehicles that meet the occupant crash protection requirements of §5.1 of 49 CFR 571.208 by means of inflatable restraint systems and meet the requirements of §4.1.5.1(a)(3) by means of a Type 2 seat belt assembly at the right front designated seating position, the deceleration of the head form shall not exceed 80 g continuously for more than 3 milliseconds.

S5.1.1 The requirements of S5.1 do not apply to:

(a) Console assemblies; 

(b) Areas less than 125 mm inboard from the juncture of the instrument panel attachment to the body side inner structure;
(c) Areas closer to the windshield juncture than those statically contactable by the head form with the windshield in place;

(d) Areas outboard of any point of tangency on the instrument panel of a 165 mm diameter head form tangent to and inboard of a vertical longitudinal plane tangent to the inboard edge of the steering wheel; or

(e) Areas below any point at which a vertical line is tangent to the rearmost surface of the panel.

S5.1.2 Demonstration procedures. Tests shall be performed as described in Society of Automotive Engineers Recommended Practice J921, “Instrument Panel Laboratory Impact Test Procedure,” June 1965, using the specified instrumentation or instrumentation that meets the performance requirements specified in Society of Automotive Engineers Recommended Practice J977, “Instrumentation for Laboratory Impact Tests,” November 1966, except that:

(a) The origin of the line tangent to the uppermost seat back frame component shall be a point on a transverse horizontal line through the seating reference point of the front outboard passenger designated seating position, displaced vertically an amount equal to the rise which results from a 125 mm forward adjustment of the seat or 19 mm; and

(b) Direction of impact shall be either:

(1) In a vertical plane parallel to the vehicle longitudinal axis; or

(2) In a plane normal to the surface at the point of contact.

(c) For seats without head restraints installed, tests shall be performed for each individual split or bucket seat back at points within 100 mm left and right of its centerline, and for each bench seat back between points 100 mm outboard of the centerline of each outboard designated seating position;

(d) For seats having head restraints installed, each test shall be conducted with the head restraints in place at its lowest adjusted position, at a point on the head restraint centerline; and

(e) For a seat that is installed in more than one body style, tests conducted at the fore and aft extremes identified by application of subparagraph (a) shall be deemed to have demonstrated all intermediate conditions.

S5.3 Interior compartment doors. Each interior compartment door assembly located in an instrument panel, console assembly, seat back, or side panel adjacent to a designated seating position shall remain closed when tested in accordance with either S5.3.1(a) and S5.3.1(b) or S5.3.1(a) and S5.3.1(c). Additionally, any interior compartment side-facing, back-to-back, folding auxiliary jump, and temporary seats.
§ 571.201 49 CFR Ch. V (10–1–08 Edition)

Door located in an instrument panel or seat back shall remain closed when the instrument panel or seat back is tested in accordance with S5.1 and S5.2. All interior compartment door assemblies with a locking device must be tested with the locking device in an unlocked position.

S5.3.1 Demonstration procedures.
(a) Subject the interior compartment door latch system to an inertia load of 10g in a horizontal transverse direction and an inertia load of 10g in a vertical direction in accordance with the procedure described in section 5 of SAE Recommended Practice J839b, “Passenger Car Side Door Latch Systems,” May 1965, or an approved equivalent.
(b) Impact the vehicle perpendicularly into a fixed collision barrier at a forward longitudinal velocity of 48 kilometers per hour.
(c) Subject the interior compartment door latch system to a horizontal inertia load of 30g in a longitudinal direction in accordance with the procedure described in section 5 of SAE Recommended Practice J839b, “Passenger Car Side Door Latch Systems,” May 1965, or an approved equivalent.

S5.4 Sun visors.
S5.4.1 A sun visor that is constructed of or covered with energy-absorbing material shall be provided for each front outboard designated seating position.
S5.4.2 Each sun visor mounting shall present no rigid material edge radius of less than 3.2 mm that is statically contactable by a spherical 165 mm diameter head form.

S5.5 Armrests.
S5.5.1 General. Each installed armrest shall conform to at least one of the following:
(a) It shall be constructed with energy-absorbing material and shall deflect or collapse laterally at least 50 mm without permitting contact with any underlying rigid material.
(b) It shall be constructed with energy-absorbing material that deflects or collapses to within 32 mm of a rigid test panel surface without permitting contact with any rigid material. Any rigid material between 13 and 32 mm from the panel surface shall have a minimum vertical height of not less than 25 mm.
(c) Along not less than 50 continuous mm of its length, the armrest shall, when measured vertically in side elevation, provide at least 50 mm of coverage within the pelvic impact area.

S5.5.2 Folding armrests. Each armrest that folds into the seat back or between two seat backs shall either:
(a) Meet the requirements of S5.5.1; or
(b) Be constructed of or covered with energy-absorbing material.

S6 Requirements for upper interior components.
S6.1 Vehicles manufactured on or after September 1, 1998. Except as provided in S6.3 and S6.1.4, for vehicles manufactured on or after September 1, 1998 and before September 1, 2002, a percentage of the manufacturer’s production, as specified in S6.1.1, S6.1.2, or S6.1.3 shall conform, at the manufacturer’s option, to either S6.1(a) or S6.1(b). For vehicles manufactured by final stage manufacturers on or after September 1, 1998 and before September 1, 2006, a percentage of the manufacturer’s production as specified in S6.1.4 shall, except as provided in S6.3, conform, to either S6.1(a) or S6.1(b). The manufacturer shall select the option by the time it certifies the vehicle and may not thereafter select a different option for the vehicle.
(a) When tested under the conditions of S8, comply with the requirements specified in S7 at the target locations specified in S10 when impacted by the free motion headform specified in S8.9 at any speed up to and including 24 km/h (15 mph). The requirements do not apply to any target that cannot be located using the procedures of S10.
(b) When equipped with a dynamically deployed upper interior head protection system and tested under the conditions of S8, comply with the requirements specified in S7 at the target locations specified in S10 as follows:
(1) Targets that are not located over any point inside the area measured along the contour of the vehicle surface within 50 mm (2.0 inch) of the periphery of the stowed system projected perpendicularly onto the vehicle interior surface, including mounting and inflation components but exclusive of any cover or covers, shall be impacted by the free motion headform specified in S8.9 at any speed up to and including
24 km/h (15 mph). The requirements do not apply to any targets that can not be located by using the procedures of S10.

(2) Targets that are over any point inside the area measured along the contour of the vehicle interior within 50 mm (2.0 inch) of the periphery of the stowed system projected perpendicularly onto the vehicle interior surface, including mounting and inflation components but exclusive of any cover or covers, when the dynamically deployed upper interior head protection system is not deployed, shall be impacted by the free motion headform specified in S8.9 at any speed up to and including 19 km/h (12 mph) with the system undeployed. The requirements do not apply to any target that can not be located using the procedures of S10.

(3) Each vehicle shall, when equipped with a dummy test device specified in Part 572, Subpart M, and tested as specified in S8.16 through S8.28, comply with the requirements specified in S7 when crashed into a fixed, rigid pole of 254 mm in diameter, at any velocity between 24 kilometers per hour (15 mph) and 29 kilometers per hour (18 mph).

S6.1.1 Phase-in Schedule #1

S6.1.1.1 Vehicles manufactured on or after September 1, 1998 and before September 1, 1999. Subject to S6.1.5(a), for vehicles manufactured by a manufacturer on or after September 1, 1998 and before September 1, 1999, the amount of vehicles complying with S7 shall be not less than 10 percent of:

(a) The manufacturer’s average annual production of vehicles manufactured on or after September 1, 1996 and before September 1, 1999, or

(b) The manufacturer’s production on or after September 1, 1998 and before September 1, 1999.

S6.1.1.2 Vehicles manufactured on or after September 1, 1999 and before September 1, 2000. Subject to S6.1.5(b), for vehicles manufactured by a manufacturer on or after September 1, 1999 and before September 1, 2000, the amount of vehicles complying with S7 shall be not less than 25 percent of:

(a) The manufacturer’s average annual production of vehicles manufactured on or after September 1, 1997 and before September 1, 2000, or

(b) The manufacturer’s production on or after September 1, 1999 and before September 1, 2000.

S6.1.1.3 Vehicles manufactured on or after September 1, 2000 and before September 1, 2001. Subject to S6.1.5(c), for vehicles manufactured by a manufacturer on or after September 1, 2000 and before September 1, 2001, the amount of vehicles complying with S7 shall be not less than 40 percent of:

(a) The manufacturer’s average annual production of vehicles manufactured on or after September 1, 1998 and before September 1, 2001, or

(b) The manufacturer’s production on or after September 1, 2000 and before September 1, 2001.

S6.1.1.4 Vehicles manufactured on or after September 1, 2001 and before September 1, 2002. Subject to S6.1.5(d), for vehicles manufactured by a manufacturer on or after September 1, 2001 and before September 1, 2002, the amount of vehicles complying with S7 shall be not less than 70 percent of:

(a) The manufacturer’s average annual production of vehicles manufactured on or after September 1, 1999 and before September 1, 2002, or

(b) The manufacturer’s production on or after September 1, 2001 and before September 1, 2002.

S6.1.2 Phase-in Schedule #2

S6.1.2.1 Vehicles manufactured on or after September 1, 1998 and before September 1, 1999. Subject to S6.1.5(a), for vehicles manufactured by a manufacturer on or after September 1, 1998 and before September 1, 1999, the amount of vehicles complying with S7 shall be not less than seven percent of:

(a) The manufacturer’s average annual production of vehicles manufactured on or after September 1, 1996 and before September 1, 1999, or

(b) The manufacturer’s production on or after September 1, 1998 and before September 1, 1999.

S6.1.2.2 Vehicles manufactured on or after September 1, 1999 and before September 1, 2000. Subject to S6.1.5(b), for vehicles manufactured by a manufacturer on or after September 1, 1999 and before September 1, 2000, the amount of vehicles complying with S7 shall be not less than 31 percent of:
§571.201

(a) The manufacturer’s average annual production of vehicles manufactured on or after September 1, 1997 and before September 1, 2000, or

(b) The manufacturer’s production on or after September 1, 1999 and before September 1, 2000.

S6.1.2.3 Vehicles manufactured on or after September 1, 2000 and before September 1, 2001. Subject to S6.1.5(c), for vehicles manufactured by a manufacturer on or after September 1, 2000 and before September 1, 2001, the amount of vehicles complying with §7 shall be not less than 40 percent of:

(a) The manufacturer’s average annual production of vehicles manufactured on or after September 1, 1998 and before September 1, 2001, or

(b) The manufacturer’s production on or after September 1, 2000 and before September 1, 2001.

S6.1.2.4 Vehicles manufactured on or after September 1, 2000 and before September 1, 2002. Subject to S6.1.5(d), for vehicles manufactured by a manufacturer on or after September 1, 2001 and before September 1, 2002, the amount of vehicles complying with §7 shall be not less than 70 percent of:

(a) The manufacturer’s average annual production of vehicles manufactured on or after September 1, 1999 and before September 1, 2001, or

(b) The manufacturer’s production on or after September 1, 2001 and before September 1, 2002.

S6.1.3 Phase-in Schedule #3

S6.1.3.1 Vehicles manufactured on or after September 1, 1998 and before September 1, 1999 are not required to comply with the requirements specified in §7.

S6.1.3.2 Vehicles manufactured on or after September 1, 1999 shall comply with the requirements specified in §7.

S6.1.4 Phase-in Schedule #4 A final stage manufacturer or alterer may, at its option, comply with the requirements set forth in S6.1.4.1 and S6.1.4.2.

S6.1.4.1 Vehicles manufactured on or after September 1, 1998 and before September 1, 2009 are not required to comply with the requirements specified in §7.

S6.1.4.2 Vehicles manufactured on or after September 1, 2009 shall comply with the requirements specified in §7.

S6.1.5 Calculation of complying vehicles.

(a) For the purposes of complying with S6.1.1.1 or S6.1.2.1, a manufacturer may count a vehicle if it is manufactured on or after May 8, 1997, but before September 1, 1999.

(b) For the purposes of complying with S6.1.1.2 or S6.1.2.2, a manufacturer may count a vehicle if it:

1) Is manufactured on or after May 8, 1997, but before September 1, 2000, and

2) Is not counted toward compliance with S6.1.1.1 or S6.1.2.1, as appropriate.

(c) For the purposes of complying with S6.1.1.3 or S6.1.2.3, a manufacturer may count a vehicle if it:

1) Is manufactured on or after May 8, 1997, but before September 1, 2001, and

2) Is not counted toward compliance with S6.1.1.1, S6.1.1.2, S6.1.2.1, S6.1.2.2, as appropriate.

(d) For the purposes of complying with S6.1.1.4 or S6.1.2.4, a manufacturer may count a vehicle if it:

1) Is manufactured on or after May 8, 1997, but before September 1, 2002, and

2) Is not counted toward compliance with S6.1.1.1, S6.1.1.2, S6.1.1.3, S6.1.2.1, S6.1.2.2, or S6.1.2.3, as appropriate.

S6.1.6 Vehicles produced by more than one manufacturer.
