SECTION 1

PURPOSE OF COMPLIANCE TEST

This test is part of the Federal Motor Vehicle Safety Standard (FMVSS) 114 Compliance Test Program conducted for the National Highway Traffic Safety Administration (NHTSA) by General Dynamics Advanced Information Engineering Services under Contract No. DTNH22-01-C-01025. The purpose of this test was to determine if the subject vehicle, a 2004 Ford Econoline Van, was in compliance with FMVSS No. 114, Theft Protection. The purpose of this standard is to reduce the incidence of crashes resulting from unauthorized operation of vehicles by specifying requirements for theft protection. Additionally, FMVSS No. 114 specifies requirements to reduce the incidents of crashes from rollaway of parked vehicles with automatic transmissions as a result of children moving the shift mechanism out of the "park" position. This standard applies to passenger cars, trucks, and multipurpose passenger vehicles having a Gross Vehicle Weight Rating (GVWR) of 4536 kilograms or less. This compliance test was conducted using the requirements found in the OVSC Laboratory Test Procedure No. TP-114-01, dated December 17, 1997.
SECTION 2

TEST PROCEDURE AND DISCUSSION OF RESULTS

A 2004 Ford Econoline Van with an automatic transmission was subjected to FMVSS No. 114 testing in accordance with the NHTSA Office of Vehicle Safety Compliance (OVSC) Laboratory Test Procedure TP-114-01, dated December 17, 1997. This test was performed by General Dynamics Advanced Information Engineering Services on April 29, 2004.

The test equipment used for this test included a standard metric tape ruler, a digital inclinometer with digitalclinometer function, weight scales and a digital transonimeter. Testing was performed in the following sequence:

**KEY LOCKING SYSTEM REQUIREMENT (S4.2):**

The key locking system with the key removed, did prevent normal activation of the vehicle's engine. Both steering and forward self mobility were prevented.

**WARNING ALARM REQUIREMENT (S4.5):**

With the key left in the locking system and the driver's door opened, an audible alarm was activated. This "warning to the driver" was verified in all ignition switch positions except "on" and "start".

**"PARK" POSITION REQUIREMENT (S4.2.1(a)(2)):**

The key locking system only permitted removal of the key when the automatic transmission shift lever was locked in "park". Key removal was attempted in all shift lever positions. On this vehicle, the transmission shift lever would not remain between detent positions without assistance.

**TEN PERCENT GRADE "PARK" REQUIREMENT (S4.2.1(a)(3)):**

The vehicle was driven forward and stopped with the service brakes on a 10.4% grade. The parking brake was fully applied and the transmission lever was placed in "park". When the service and parking brakes were released the vehicle moved 9 mm (150 mm maximum is allowed on a 10% grade). Since the available test grade was more stringent than the specified condition, the subject vehicle appeared to perform within the safety performance requirements.

**SPECIAL DEVICES REQUIREMENT (S4.2.2):**

The vehicle was not equipped with any special devices.

**"OUT OF PARK"POSITION REQUIREMENT (S4.3):**

Starting from the condition of the engine running at idle with the transmission shift lever in the "drive" position, the steering wheel remained unlocked and the vehicle was free to roll with the transmission shift lever in each position except "park" or "reverse" when the key locking system was turned to the "off" and "lock" position.
SECTION 3

TEST DATA
LOCATION OF KEY LOCKING SYSTEM: The key locking system consisted of an ignition switch located on the right side of the steering column and a transmission shift lever mounted to the upper right corner of the steering column.

**TRANSMISSION TYPE:**
- Automatic X

</tbody>
</table>

NOTE: In the event that the key can be removed at any of the transmission shift lever positions, the vehicle's transmission or transmission shift lever shall become locked in "park" as the direct result of removing the key. If such a mechanism exists, describe the mechanism and its function:

No such mechanism is available.

System prevents movement of the shift mechanism out of "park" position after removal of key.
