DISCUSSION OF TESTS

Test Vehicle: 2006 Buick Lucerne  
Test Program: FMVSS 208 Compliance  
NHTSA No.: C60105  
Test Date: 5/12/06-7/25/06

The vehicle appeared to meet all performance requirements.

A blanket and visor were not used in the suppression testing because they did not affect the sensing system used on the vehicle.

Prior to the frontal impact the Instrument Panel (X) accelerometer was removed at the request of the COTR due to the deployment characteristics of the passenger air bag.

Mark each position so that there is a visual indication when the seat is at a particular position. For manual seats, move the seat forward one detent at a time and mark each detent. For power seats, mark only the rearmost, middle, and foremost positions. Label three of the positions with the following: F for foremost, M for mid-position (if there is no mid-position, label the closest adjustment position to the rear of the mid-point), and R for rearmost.

   __N/A – No lumbar adjustment

X 2. Position any adjustable parts of the seat that provide additional support so that they are in the lowest or most open adjustment position. (S16.2.10.2)
   __N/A – No additional support adjustment

H-POINT DETERMINATION FOR 50\textsuperscript{TH} PERCENTILE MALE DUMMY

Test Vehicle: 2006 Buick Lucerne  
Test Program: FMVSS 208 Compliance  
Test Technician: Eric Peschman

X Driver Designated Seating Position  
___ Passenger Designated Seating Position

\textbf{X 1.} Place the seat in the mid-fore-aft position and full down position, with the head restraint full down and the seat back in the manufacturer's nominal design riding position for the 50\textsuperscript{th} percentile male as determined during the completion of Data Sheet 14.2.

\textbf{X 2.} Place a 910 mm\textsuperscript{2} piece of muslin cotton cloth over the seat area. (The muslin cloth shall be comparable to 48 threads/in\textsuperscript{2} and density of 2.85 lb/yd.) Tuck the muslin cloth in a sufficient amount to prevent hammocking of the material.

\textbf{X 3.} Place the seat and back assembly of the H-Point machine at the centerline of the seat as determined in Data Sheet 14.1 or 14.2.

\textbf{X 4.} Install the lower leg, and foot segments.

\textbf{X 5.} Set the length of the lower leg segment at 16.3 inches and the length of the thigh bar at 15.8 inches.

\textbf{X 6.} Leg and foot placement

\textbf{X 6.1} Driver Designated Seating Position

\textbf{X 6.1.1} Insert the pin so that the foot angle is never less than 87 degrees.

\textbf{X 6.1.2} Place the right foot on the undepressed accelerator pedal with the sole of the foot on the pedal and the heel as far forward as allowable. Do not place the heel on the toe board.

\textbf{X 6.1.3} Adjust the left leg to be the same distance from H-point machine centerline as the right leg.

\textbf{X 6.1.3} With the T-bar level, place the left foot on the toe board with the rearmost point of the heel resting on the floor pan as close as possible to the point of intersection of the planes described by the toe board and the floor pan and not on the wheelwell projection. If the foot cannot be positioned on the toe board, set it on the floor pan.

\textbf{X 6.2} Passenger Designated Seating Position

\textbf{X 6.2.1} Insert the pin so that the foot angle is never less than 87 degrees.

\textbf{X 6.2.2} Space the lower legs 10.6 inches apart, equally spaced about the centerline of the H-point machine.

\textbf{X 6.2.3} With the T-bar level, place the left foot on the toe board with the rearmost point of the heel resting on the floor pan as close as possible to the point of intersection of the planes described by the toe board and the floor pan and not on the wheelwell projection. If the foot cannot be positioned on the toe board, set it on the floor pan.

\textbf{X 7.} Apply the lower leg weights.

\textbf{X 8.} Apply the thigh weights.

Test Program: FMVSS 208 Compliance  
Test Technician: Eric Peschman

NHTSA No.: C60105  
Test Date: 7/25/06
9. Tilt the back pan forward against the forward stop and draw the H-point machine away from the seatback using the T-bar.

10. Repositioning the back pan

10.1 Allow the H-point machine to slide rearward until a forward horizontal restraining load on the T-bar is no longer required due to the seat pan contacting the seat back.

10.2 Slide the H-point machine rearward by a horizontal rearward load applied at the T-bar until the seat pan contacts the seat back.

11. Apply a 10 kg load at the intersection of the hip angle quadrant and the T-bar housing along a line from the above intersection to a point just above the thigh bar housing.

12. Again apply a 10 kg load at the intersection of the hip angle quadrant and the T-bar housing along a line from the above intersection to a point just above the thigh bar housing.

13. Carefully return the back pan to the seat back.

14. Install the right and left buttock weights.

15. Install the eight torso weights alternately the installation between right and left.

16. Tilt the back pan forward until the stop is contacted.

17. Rock the H-point from side to side over a 10 degree arc (5 degrees each side of the vertical centerline) for three complete cycles. Restrain the T-bar during rocking so that the seat pan does not change position. Minimize any inadvertent exterior loads applied in a vertical or fore-aft direction. The feet are free to move during this rocking motion.

18. Without applying a forward or lateral load lift the right foot off the floor the minimum amount necessary until no additional forward foot movement is obtained.

19. Lower the right foot until the heel is in contact with the floor pan and the ball of the foot is in contact with the floor, toe board, or undepressed accelerator pedal.

20. Without applying a forward or lateral load lift the left foot off the floor the minimum amount necessary until no additional forward foot movement is obtained.

21. Lower the left foot until the heel is in contact with the floor pan and the ball of the foot is in contact with the floor or toe board.

22. Is the seat pan level?

   Yes. Go to 24

   No. Go to 23

23. Apply a sufficient lateral load to the top of the seatback pan to level the H-point machine seat pan on the seat.

24. Holding the T-bar to prevent the H-point from sliding forward on the seat cushion, return the seatback pan to the seatback.

25. Holding the T-bar to prevent the H-point from sliding forward on the seat cushion, apply sufficient rearward force perpendicular to the back angle bar just above the torso weights to increase the hip angle 3 degrees. Minimize the exterior downward or side forces applied to the H-point machine. Release the force. Repeat this step until the hip angle readout is identical. Complete as many force applications as necessary and record the results in the following table:

13.1 Mark a point on the vehicle above the center of each wheel.
13.2 Place the vehicle on a level surface.
13.3 Measure perpendicular to the level surface to the 4 points marked on the body and record the measurements

RF: 746  LF: 759  RR: 770  LR: 770

14. Calculate the Rated Cargo and Luggage Weight (RCLW): 80 kg
14.1 Does the vehicle have the vehicle capacity weight (VCW) on the certification label or tire placard?
   X Yes, go to 14.3
   X No, go to 14.2

14.2 VCW = Gross Vehicle Weight – UVW

   VCW = __________ - __________ = __________

X 14.3 VCW = 488 kg (1076 lbs)
14.4 Does the certification or tire placard contain the Designated Seating Capacity (DSC)?
   X Yes, go to 14.6
   X No, go to 14.5 and skip 14.6

14.5 DSC = Total number of seat belt assemblies = __________

X 14.6 DSC = 6
14.7 RCLW = VCW – (68 kg x DSC) = 488 kg - (68 kg x 6) = 80 kg

14.8 Is the vehicle certified as a truck, MPV or bus (see the certification label on the door jamb)?
   X Yes, if the calculated RCLW is greater than 136 kg, use 136 kg as the RCLW. (S8.1.1)
   X No, use the RCLW calculated in 14.7

15. Fully Loaded Weight (100% fuel fill): 1767.2 kg
15.1 Place the appropriate test dummy in both front outboard seating positions.

Driver: ___ 5th female X 50th male
Passenger: ___ 5th female X 50th male

15.2 Load the vehicle with the RCLW from 14.7 or 14.8 whichever is applicable.
15.3 Place the RCLW in the cargo area. Center the load over the longitudinal centerline of the vehicle. (S8.1.1 (d))
15.4 Record the vehicle weight at each wheel to determine the Fully Loaded Weight.

17. Drain the fuel system

18. Using purple dyed Stoddard solvent having the physical and chemical properties of Type 1 solvent or cleaning fluid, Table 1, ASTM Standard D484-71, “Standard Specifications for Hydrocarbon Dry-cleaning Solvents,” fill the fuel tank to 92 - 94 percent of useable capacity.

Fuel tank capacity x .94 = 70.4 liters (18.6 gallons) x .94 = 66.2 liters (17.5 gallons)

Amount added 65.5 liters (17.3 gallons) 93%

19. Crank the engine to fill the fuel delivery system with Stoddard solvent

20. Calculate the test weight range.

20.1 Calculated Weight = UVW (see 12 above) + RCLW (see 14 above) + 2x(dummy weight)

1951.1 kg = 1715.1 kg + 80.0 kg + 156.0 kg

20.2 Test Weight Range = Calculated Weight ( - 4.5 kg, - 9 kg.)

Max. Test Weight = Calculated Test Weight – 4.5 kg = 1946.6 kg

Min. Test Weight = Calculated Test Weight – 9 kg = 1942.1 kg

21. Remove the RCLW from the cargo area.

22. Drain transmission fluid, engine coolant, motor oil, and windshield washer fluid from the test vehicle so that Stoddard solvent leakage from the fuel system will be evident.

23. Vehicle Components Removed For Weight Reduction:

Spare tire, jack and tools, rear seat cushion, and trunk interior

24. Secure the equipment and ballast in the load carrying area and distribute it, as nearly as possible, to obtain the proportion of axle weight indicated by the gross axle weight ratings and center it over the longitudinal centerline of the vehicle.

25. If necessary, add ballast to achieve the actual test weight.

N/A

Weight of Ballast: 68.0 kg

26. Ballast, including test equipment, must be contained so that it will not shift during the impact event or interfere with data collection or interfere with high-speed film recordings or affect the structural integrity of the vehicle or do anything else to affect test results. Care must be taken to assure that any attachment hardware added to the vehicle is not in the vicinity of the fuel tank or lines.

27. Record the vehicle weight at each wheel to determine the actual test weight.

   Distance between targets (mm): 100 mm

1.3 Three circular targets at least 90 mm in diameter and with black and yellow quadrants are mounted at the back on the outboard sides of on A1 and A2. The center of each circular target is 100 mm from the one next to it.

   Distance between targets (mm): 100 mm

1.4 The distance between the first circular target at the front of A1 and A2 and the last circular target at the back of A1 and A2 is at least 915 mm.

   Distance between the first and last circular targets (mm): 915 mm

1.5 Firmly fix target A1 on the vehicle roof in the vertical longitudinal plane that is coincident with the midsagittal plane of the driver dummy.

1.6 Firmly fix target A2 on the vehicle roof in the vertical longitudinal plane that is coincident with the midsagittal plane of the passenger dummy.

1.7 Two circular targets (C1 and C2) at least 90 mm in diameter and with black and yellow quadrants are mounted on the outside of the driver door. The centers of each circular target are at least 610 mm apart.

   Distance between targets (mm): 608 mm

   Distance between targets (mm): 608 mm

1.9 Place tape with squares having alternating colors on the top portion of the steering wheel.

1.10 Chalk the bottom portion of the steering wheel

1.11 Is this an offset test?

   Yes, continue with this section

   No, go to 2.

1.12 Measure the width of the vehicle.

   Vehicle width (mm):
1.13 Find the centerline of the vehicle. (½ of the vehicle width)

1.14 Find the line parallel to the centerline of the vehicle and 0.1 x vehicle width from the centerline of the vehicle.

1.15 Apply 25 mm wide tape with alternating black and yellow squares parallel to and on each side of the line found in 1.14. The edge of each tape shall be 50 mm from the line found in 1.14. The tape shall extend from the bottom of the bumper to the front edge of the windshield. (Figure 28D)

2. Barrier Targeting

2.1 Fix two stationary targets D1 and D2 to the barrier as shown in the Figure 28A. One target is in the vertical longitudinal plane that is coincident with the midsagittal plane of the driver dummy. The other is in the vertical longitudinal plane that is coincident with the midsagittal plane of the passenger dummy

2.2 Targets D1 and D2 are on a rectangular panel.

2.3 Three circular targets at least 90 mm in diameter and with black and yellow quadrants are mounted on the sides of the rectangular panel away from the longitudinal centerline of the vehicle. The center of each circular target is 100 mm from the one next to it.
