SECTION 1
PURPOSE OF COMPLIANCE TEST

The tests performed are part of a program conducted for the National Highway Traffic Safety Administration (NHTSA) by MGA Research Corporation (MGA) under Contract No. DTNH22-03-D-11002. The purpose of this test was to determine whether the subject vehicle, a 2007 Nissan Versa, NHTSA No. C75205, meets certain performance requirements of FMVSS 208, "Occupant Crash Protection"; FMVSS 212, "Windshield Mounting"; FMVSS 219, "Windshield Zone Intrusion"; and FMVSS 301, "Fuel System Integrity". The compliance test was conducted in accordance with OVSC Laboratory Test Procedure No. TP208-13 dated July 27, 2005.

   Unbelted 50th male dummy passenger (32 to 40 kmph) (S5.1.2.(a)(2) or S5.1.2(b))
For the crash tests, the vehicle was instrumented with 8 accelerometers. The accelerometer data from the vehicle and dummies were sampled at 10,000 samples per second and processed as specified in SAE J211/1 MAR95 and FMVSS 208, S4.13.

The dynamic tests were recorded using high-speed film and high-speed digital video.

A blanket and visor were not used in the suppression testing because they did not affect the sensing system used on the vehicle.

The Nissan Versa passenger airbag suppression telltale light is off when the passenger seat is empty. In numerous installations of child restraint systems (CRS) the suppression system classified them as an empty seat; therefore the telltale light was off. These installations are as follows:

Cosco Dreamride 02-719 with newborn
Evenflo First Choice 204; Unbelted rear facing with 12 month old
Graco Infant 8457 with base; Belted rear facing and Unbelted forward facing with 12 month old
Evenflo Medallion 254; Belted forward and rear facing, Unbelted rear facing with 12 month old
Britax Roundabout 161; Forward facing belted with 3 year old
Evenflo Medallion 254; Forward facing belted with 3 year old
3 year old Unbelted Position 4; Sitting on seat edge, spine vertical, hands by the child’s side

A diagnostic tool supplied by Nissan was used to verify that the airbag was suppressed while the telltale light was off in these installations.

The 2007 Nissan Versa test vehicle did not suppress the passenger airbag when tested with a 6-year-old dummy sitting normally in the seat. For this test vehicle, the tested seat back angle was a subject of dispute late in the follow-up testing process and could not be successfully resolved. Further testing by Nissan and NHTSA of other seats and vehicles did not duplicate the test failure. The seat from this vehicle was tested by Nissan and disassembled as part of its investigation. After a new seat was installed in the test vehicle it was tested with the 6-year-old dummy during a supplemental suppression. These results are reported in supplemental suppression data sheet summaries that follow the original suppression data sheet summaries.

  Maximum angle Zero
  Minimum angle Zero
  Mid-angle Zero

X 1.9 If the seat and/or seat cushion height is adjustable, use any part of any control other than the parts which primarily move the seat or seat cushion fore-aft, to put the seat cushion reference point in its lowest position with the seat cushion reference line angle at the mid-angle found in 1.8. (S16.2.10.3.1)
X N/A – No seat height adjustment

X 1.10 Use only the controls that primarily move the seat in the fore-aft direction to verify the seat is in the rearmost position.
1.11 Use only the controls that primarily move the seat in the fore-aft direction to mark for future reference the fore-aft seat positions. Mark each position so that there is a visual indication when the seat is at a particular position. For manual seats, move the seat forward one detent at a time and mark each detent. For power seats, mark only the rearmost, middle, and foremost positions. Label three of the positions with the following: F for foremost, M for mid-position (if there is no mid-position, label the closest adjustment position to the rear of the mid-point), and R for rearmost.

1.12 Use only the controls that primarily move the seat in the fore-aft direction to place the seat in the rearmost position.

1.13 Use any part of any control, other than the parts which primarily move the seat or seat cushion fore-aft, to find and visually mark for future reference the maximum, minimum, and middle height of the seat cushion reference point with the seat cushion reference line at the mid-angle determined in 1.8. (S20.1.9.4, S22.1.2, S22.1.7.4, S22.3.1, S22.4.3.1, S24.1.2, S24.3.1, S24.4.3.1, S26.2.3, S26.3.1)

1.15 Use any part of any control, other than the parts which primarily move the seat or seat cushion fore-aft, to find and visually mark for future reference the maximum, minimum, and middle height of the seat cushion reference point with the seat cushion reference line at the mid-angle determined in 1.8. (S20.1.9.4, S22.1.2, S22.1.7.4, S22.3.1, S24.1.2, S24.3.1)

1.16 Use only the control that change the seat in the fore-aft direction to place the seat in the foremost position. (S16.2.10.3.2)

1.17 Use any part of any control, other than the parts which primarily move the seat or seat cushion fore-aft, to find and visually mark for future reference the maximum, minimum, and middle height of the seat cushion reference point with the seat cushion reference line at the mid-angle determined in 1.8. (S16.2.10.3.3, S20.1.9.4, S22.1.2, S22.1.7.4, S22.3.1, S24.1.2, S24.3.1)

X 4. Install the lower leg, and foot segments.

X 5. Set the length of the lower leg segment at 16.3 inches and the length of the thigh bar at 15.8 inches.

X 6. Leg and foot placement

X 6.1 Driver Designated Seating Position

X 6.1.1 Insert the pin so that the foot angle is never less than 87 degrees.

X 6.1.2 Place the right foot on the undepressed accelerator pedal with the sole of the foot on the pedal and the heel as far forward as allowable. Do not place the heel on the toe board.

X 6.1.3 With the T-bar level, place the left foot on the toe board with the rearmost point of the heel resting on the floor pan as close as possible to the point of intersection of the planes described by the toe board and the floor pan and not on the wheelwell projection. If the foot cannot be positioned on the toe board, set it on the floor pan.

X 7. Apply the lower leg weights.

X 8. Apply the thigh weights.

Test Vehicle: 2007 Nissan Versa  
Test Program: FMVSS 208 Compliance  
Test Technician: Joe Fleck
9. Tilt the back pan forward against the forward stop and draw the H-point machine away from the seatback using the T-bar.

10. Repositioning the back pan

10.1 Allow the H-point machine to slide rearward until a forward horizontal restraining load on the T-bar is no longer required due to the seat pan contacting the seat back.

10.2 Slide the H-point machine rearward by a horizontal rearward load applied at the T-bar until the seat pan contacts the seat back.

11. Apply a 10 kg load at the intersection of the hip angle quadrant and the T-bar housing along a line from the above intersection to a point just above the thigh bar housing.

12. Again apply a 10 kg load at the intersection of the hip angle quadrant and the T-bar housing along a line from the above intersection to a point just above the thigh bar housing.

13. Carefully return the back pan to the seat back.

14. Install the right and left buttock weights.

15. Install the eight torso weights alternately the installation between right and left.

16. Tilt the back pan forward until the stop is contacted.

17. Rock the H-point from side to side over a 10 degree arc (5 degrees to each side of the vertical centerline) for three complete cycles. Restrain the T-bar during rocking so that the seat pan does not change position. Minimize any inadvertent exterior loads applied in a vertical or fore-aft direction. The feet are free to move during this rocking motion.

18. Without applying a forward or lateral load lift the right foot off the floor the minimum amount necessary until no additional forward foot movement is obtained.

19. Lower the right foot until the heel is in contact with the floor pan and the ball of the foot is in contact with the floor, toe board, or undepressed accelerator pedal.

20. Without applying a forward or lateral load lift the left foot off the floor the minimum amount necessary until no additional forward foot movement is obtained.

21. Lower the left foot until the heel is in contact with the floor pan and the ball of the foot is in contact with the floor or toe board.

22. Is the seat pan level?

   Yes. Go to 24

   No. Go to 23

23. Apply a sufficient lateral load to the top of the seatback pan to level the H-point machine seat pan on the seat.

24. Holding the T-bar to prevent the H-point from sliding forward on the seat cushion, return the seatback pan to the seatback.

25. Holding the T-bar to prevent the H-point from sliding forward on the seat cushion, apply sufficient rearward force perpendicular to the back angle bar just above the torso weights to increase the hip angle 3 degrees. Minimize the exterior downward or side forces applied to the H-point machine. Release the force. Repeat this step until the hip angle readout is identical. Successful Unbelted 5th percentile Female Dummy Reactivation was performed with the seat in the Forward position. (SN507)

* The CRS would not fit in this Forward Seat Slide position. If there is a number in the Seat Slide column, it indicates the fore-aft detent position with respect to the foremost position. (1 = Full Forward; 25 = Full Rearward; 25 total Seat Slide detents)

** The Nissan Versa passenger air bag suppression telltale light is off when the passenger seat is empty. In two unbelted positions the suppression system classified the 3-year-old as an empty seat; therefore the telltale light was off. A diagnostic tool supplied by Nissan was used to verify that the airbag was suppressed in these cases.

*** The manufacturer’s design seat back angle of 7th Detent 1st as 0 equated to 7.8° on the head rest post.

12. Record the vehicle weight at each wheel to determine the unloaded vehicle weight (UVW), i.e. "as delivered" weight.

| Right Front (kg): | 370.1 | Right Rear (kg): | 250.4 |
| Left Front (kg): | 371.5 | Left Rear (kg): | 244.0 |
| Total Front (kg): | 741.6 | Total Rear (kg): | 494.4 |
| % Total Weight: | 60.0 | % Total Weight: | 40.0 |

UVW = TOTAL FRONT PLUS TOTAL REAR (KG): 1236.0

13. UVW Test Vehicle Attitude: (All dimensions in millimeters)
13.1 Mark a point on the vehicle above the center of each wheel.
13.2 Place the vehicle on a level surface.
13.3 Measure perpendicular to the level surface to the 4 points marked on the body and record the measurements

|        | RF: 685 | LF: 687 | RR: 685 | LR: 682 |

14. Calculate the Rated Cargo and Luggage Weight (RCLW): 50 kg

14.1 Does the vehicle have the vehicle capacity weight (VCW) on the certification label or tire placard?

- Yes, go to 14.3
- No, go to 14.2

14.2 VCW = Gross Vehicle Weight – UVW

\[ VCW = \text{Gross Vehicle Weight} - \text{UVW} \]

14.3 VCW = 390 kg (860 lbs)

14.4 Does the certification or tire placard contain the Designated Seating Capacity (DSC)?

- Yes, go to 14.6
- No, go to 14.5 and skip 14.6

14.5 DSC = Total number of seat belt assemblies = _________

14.6 DSC = 5

14.7 RCLW = VCW – (68 kg x DSC) = 390 kg - (68 kg x 5) = 50 kg

14.8 Is the vehicle certified as a truck, MPV or bus (see the certification label on the door jamb)?

- Yes, if the calculated RCLW is greater than 136 kg, use 136 kg as the RCLW. (S8.1.1)
- No, use the RCLW calculated in 14.7

15. Fully Loaded Weight (100% fuel fill): 1442.0 kg

15.1 Place the appropriate test dummy in both front outboard seating positions.

- Driver: 5th female
- Passenger: 5th female

15.2 Load the vehicle with the RCLW from 14.7 or 14.8 whichever is applicable.

15.3 Place the RCLW in the cargo area. Center the load over the longitudinal centerline of the vehicle. (S8.1.1 (d))

15.4 Record the vehicle weight at each wheel to determine the Fully Loaded Weight.

| Right Front (kg): | 417.8 | Right Rear (kg): | 306.6 |
| Left Front (kg): | 417.3 | Left Rear (kg): | 300.3 |
| Total Front (kg): | 835.1 | Total Rear (kg): | 606.9 |
| % Total Weight: | 57.9 | % Total Weight: | 42.1 |
| % GVW | 47.6 | % GVW | 52.9 |

(\% GVW = Axle GVW divided by Vehicle GVW)

Fully Loaded Weight = Total Front Plus Total Rear (kg): 1442.0

16. Fully Loaded Test Vehicle Attitude: (All dimensions in millimeters)

16.1 Place the vehicle on a level surface.
16.2 Measure perpendicular to the level surface to the 4 points marked on the body (see 13.1 above) and record the measurements

17. Drain the fuel system

18. Using purple dyed Stoddard solvent having the physical and chemical properties of Type 1 solvent or cleaning fluid, Table 1, ASTM Standard D484-71, “Standard Specifications for Hydrocarbon Dry-cleaning Solvents,” fill the fuel tank to 92 - 94 percent of useable capacity.

Fuel tank capacity x .94 = 45.0 liters (11.88 gallons) x .94 = 42.2 liters (11.2 gallons)

Amount added 42.2 liters (11.2 gallons) 94%

19. Crank the engine to fill the fuel delivery system with Stoddard solvent

20. Calculate the test weight range.

20.1 Calculated Weight = UVW (see 12 above) + RCLW (see 14 above) + 2x(dummy weight)

1442.0 kg = 1236.0 kg + 50.0 kg + 156.0 kg

20.2 Test Weight Range = Calculated Weight (- 4.5 kg, - 9 kg.)

Max. Test Weight = Calculated Test Weight – 4.5 kg = 1437.5 kg

Min. Test Weight = Calculated Test Weight – 9 kg = 1433.0 kg

21. Remove the RCLW from the cargo area.

22. Drain transmission fluid, engine coolant, motor oil, and windshield washer fluid from the test vehicle so that Stoddard solvent leakage from the fuel system will be evident.

23. Vehicle Components Removed For Weight Reduction: 

None

24. Secure the equipment and ballast in the load carrying area and distribute it, as nearly as possible, to obtain the proportion of axle weight indicated by the gross axle weight ratings and center it over the longitudinal centerline of the vehicle.

25. If necessary, add ballast to achieve the actual test weight.

N/A

26. Ballast, including test equipment, must be contained so that it will not shift during the impact event or interfere with data collection or interfere with high-speed film recordings or affect the structural integrity of the vehicle or do anything else to affect test results. Care must be taken to assure that any attachment hardware added to the vehicle is not in the vicinity of the fuel tank or lines.

27. Record the vehicle weight at each wheel to determine the actual test weight.

1. **Pre-Crash**
   
   1.1 Describe from visual inspection how the windshield is mounted and describe any trim material.
   
   Retained with glue
   Plastic trim

   1.2 Mark the longitudinal centerline of the windshield

   1.3 Measure pre-crash A, B, and C for the left side and record in the chart below.

   1.4 Measure pre-crash C, D, and E for the right side and record in the chart below.

   1.5 Measure from the edge of the retainer or molding to the edge of the windshield.
   Dimension G (mm): 7 mm

2. **Post Crash**

   2.1 Can a single thickness of copier type paper (as small a piece as necessary) slide between the windshield and the vehicle body?
   
   X No – Pass. Skip to the table of measurements, complete it by repeating the pre-crash measurements in the post crash column, and calculate the retention percentage, which will be 100%.

   Yes, go to 2.2

   2.2 Visibly mark the beginning and end of the portions of the periphery where the paper slides between the windshield and the vehicle body.

   2.3 Measure and record post-crash A, B, C, D, E, and F such that the measurements do not include any of the parts of the windshield where the paper slides between the windshield and the vehicle body.

   2.4 Calculate and record the percent retention for the right and left side of the windshield.

   2.5 Is total right side percent retention less than 75%?
   
   Yes, Fail
   No, Pass

   2.6 Is total left side percent retention less than 75%?
