SECTION 1
PURPOSE OF COMPLIANCE TESTS

The tests performed are part of a program conducted for the National Highway Traffic Safety Administration (NHTSA) by MGA Research Corporation (MGA) under Contract No. DTNH22-03-D-11002. The purpose of this test was to determine whether the subject vehicle, a 2008 Toyota Highlander, NHTSA No. C85101, meets certain performance requirements of FMVSS 208, "Occupant Crash Protection"; FMVSS 212, "Windshield Mounting"; FMVSS 219, "Windshield Zone Intrusion"; and FMVSS 301, "Fuel System Integrity". The compliance test was conducted in accordance with OVSC Laboratory Test Procedure No. TP208-13 dated July 27, 2005.

For the crash tests, the vehicle was instrumented with 8 accelerometers. The accelerometer data from the vehicle and dummies were sampled at 10,000 samples per second and processed as specified in SAE J211/1 MAR95 and FMVSS 208, S4.13.

The dynamic tests were recorded using high-speed film and high-speed digital video.

The vehicle does not appear to meet the performance requirements to which it was tested: TP208-13, Data Sheet 8, Step 19; The third row left rear and right rear belt would not lock at the minimum length. S7.1.1.5(c)(7) The difference between the measurements recorded under S7.1.1.5(c)(6) and (4) shall not exceed 2 inches. The seat belt would lock to secure the Graco Infant 8457 child restraint base.

9. Adjust the lap belt or lap belt portion of the seat belt assembly according to any procedures recommended in the vehicle owner’s manual to activate any locking feature so that the webbing between points A and B is at the maximum length allowed by the belt system. (S7.1.1.5(c)(2) & S7.1.1.5(c)(1))

10. Measure and record the distance between points A and B along the longitudinal centerline of the webbing for the lap belt or lap belt portion of the seat belt assembly. (S7.1.1.5(c)(2))

Measured distance between A and B (inches): 94 inches

11. Readjust the belt system so that the webbing between points A and B is at 1/2 the maximum length of the webbing. (S7.1.1.5(c)(3))

12. To the lap belt or lap belt portion of the seat belt assembly, apply a preload of 10 pounds using the webbing tension pull device in Figure 5. Apply the load in a vertical plane parallel to the longitudinal axis of the vehicle and passing through the seating reference point of the designated seating position. Apply the preload in a horizontal direction toward the front of the vehicle with a force application angle of not less than 5 degrees nor more than 15 degrees above the horizontal. (S7.1.1.5(c)(4))

Measured force application angle (Spec. 5-15 degrees): 10°

13. Measure the length between points A and B along the longitudinal centerline of the webbing while the preload is being applied. (S7.1.1.5(c)(4))

Measured distance between A and B (inches): 29 5/8 inches

14. Increase the load to 50 pounds at a rate of no more than 50 pounds per second. Attain the load in not more than 5 seconds. (If webbing sensitive emergency locking retractors are installed as part of the lap belt or lap belt portion of the seat belt assembly, apply the load at a rate less than the threshold value for lock-up specified by the manufacturer.) Maintain the load for at least 5 seconds. Measure and record the distance between points A and B along the longitudinal centerline of the webbing. (S7.1.1.5(c)(5))

Record onset rate (lb/sec) (spec. 10 to 50 lb/sec) (S7.1.1.5(c)(5)): 20 lbs/sec

Measured distance between A and B (inches) (S7.1.1.5(c)(6)): 30 inches

15. Let the seat belt webbing retract to its minimum length with the seat belt still buckled

16. To the lap belt or lap belt portion of the seat belt assembly, apply a preload of 10 pounds using the webbing tension pull device in Figure 5. Apply the load in a vertical plane parallel to the longitudinal axis of the vehicle and passing through the seating reference point of the designated seating position. Apply the preload in a horizontal direction toward the front of the vehicle with a force application angle of not less than 5 degrees nor more than 15 degrees above the horizontal. (S7.1.1.5(c)(4))

Failed; minimum won't lock

17. Measure the length between points A and B along the longitudinal centerline of the webbing while the preload is being applied. (S7.1.1.5(c)(4))

Failed; minimum won't lock

18. Increase the load to 50 pounds at a rate of no more than 50 pounds per second. Attain the load in not more than 5 seconds. (If webbing sensitive emergency locking retractors are installed as part of the lap belt or lap belt portion of the seat belt assembly, apply the load at a rate less than the threshold value for lock-up specified by the manufacturer.) Record onset rate (spec. 10 to 50 lb/sec) (S7.1.1.5(c)(5))

Failed; minimum won't lock
19. Subtract the measurement in 13 from the measurement in 14 and the measurement in 17 from the measurement in 18. Is the difference 2 inches or less for both? (S7.1.1.5(c)(7))

14-13 = 30 – 29 5/8 = 3/8 inches

18-17 = Failed; minimum won't lock

Yes – Pass AT MAX LENGTH
No – Fail AT MIN LENGTH

20. Subtract the measurement in 14 from the measurement in 10 and the measurement in 18 from the measurement in 10. Is the difference 3 inches or more for both? (S7.1.1.5(c)(8))

10-14 = 94 – 30 = 64 inches

10-18 = Failed; minimum won't lock

Yes – Pass AT MAX LENGTH
No – Fail AT MIN LENGTH

DESIGNATED SEATING POSITION: Right Front Passenger

1. Put the seat in the forwardmost fore-aft and full down height position determined in Data Sheet 14.2. (S10.7)
2. Put the seat back angle in the position determined in Data Sheet 14.2.
3. Position the test dummy using the procedures in Appendix F. (Some modifications to the positioning procedure may need to be made because the seat is in its forward most position. Note on the Appendix F positioning check sheet any deviations necessary to position the Part 572, Subpart E dummy.) Complete the Appendix F check sheets, but include them in the test report ONLY if there is a test failure.

14. Calculate the Rated Cargo and Luggage Weight (RCLW): 68 kg

14.1 Does the vehicle have the vehicle capacity weight (VCW) on the certification label or tire placard?

- [X] Yes, go to 14.3
- [ ] No, go to 14.2

14.2 VCW = Gross Vehicle Weight - UVW

\[
VCW = \underline{} - \underline{} = \underline{}
\]

14.3 VCW = 544 kg (1200lbs)

14.4 Does the certification or tire placard contain the Designated Seating Capacity (DSC)?

- [X] Yes, go to 14.6
- [ ] No, go to 14.5 and skip 14.6

14.5 DSC = Total number of seat belt assemblies = ________

14.6 DSC = __

14.7 RCLW = VCW - (68 kg x DSC) = 544 kg - (68 kg x __) = 68 kg

14.8 Is the vehicle certified as a truck, MPV or bus (see the certification label on the door jamb)?

- [X] Yes, if the calculated RCLW is greater than 136 kg, use 136 kg as the RCLW. (S8.1.1)
- [ ] No, use the RCLW calculated in 14.7

15. Fully Loaded Weight (100% fuel fill): 2035.3 kg

15.1 Place the appropriate test dummy in both front outboard seating positions.

- [X] Driver: 5th female 50th male
- [X] Passenger: 5th female 50th male

15.2 Load the vehicle with the RCLW from 14.7 or 14.8 whichever is applicable.

15.3 Place the RCLW in the cargo area. Center the load over the longitudinal centerline of the vehicle. (S8.1.1 (d))

15.4 Record the vehicle weight at each wheel to determine the Fully Loaded Weight.

16. Fully Loaded Test Vehicle Attitude: (All dimensions in millimeters)

16.1 Place the vehicle on a level surface.
16.2 Measure perpendicular to the level surface to the 4 points marked on the body (see 13.1 above) and record the measurements

| RF: | 834 | LF: | 828 | RR: | 828 | LR: | 814 |

17. Drain the fuel system

18. Using purple dyed Stoddard solvent having the physical and chemical properties of Type 1 solvent or cleaning fluid, Table 1, ASTM Standard D484-71, “Standard Specifications for Hydrocarbon Dry-cleaning Solvents,” fill the fuel tank to 92 - 94 percent of useable capacity.

Fuel tank capacity x .94 = 72.7 liters (19.2 gallons) x .94 = 68.3 liters (18.0 gallons)

Amount added 68.3 liters (18.0 gallons) 94.0%

19. Crank the engine to fill the fuel delivery system with Stoddard solvent

20. Calculate the test weight range.

20.1 Calculated Weight = UVW (see 12 above) + RCLW (see 14 above) + 2x(dummy weight)

2035.3 kg = 1869.3 kg + 68.0 kg + 98.0 kg

20.2 Test Weight Range = Calculated Weight (- 4.5 kg, - 9 kg.)

Max. Test Weight = Calculated Test Weight - 4.5 kg = 2030.8 kg

Min. Test Weight = Calculated Test Weight - 9 kg = 2026.3 kg

21. Remove the RCLW from the cargo area.

22. Drain transmission fluid, engine coolant, motor oil, and windshield washer fluid from the test vehicle so that Stoddard solvent leakage from the fuel system will be evident.

23. Vehicle Components Removed For Weight Reduction:
Rear carpet, jack and tools

24. Secure the equipment and ballast in the load carrying area and distribute it, as nearly as possible, to obtain the proportion of axle weight indicated by the gross axle weight ratings and center it over the longitudinal centerline of the vehicle.

25. If necessary, add ballast to achieve the actual test weight.

26. Ballast, including test equipment, must be contained so that it will not shift during the impact event or interfere with data collection or interfere with high-speed film recordings or affect the structural integrity of the vehicle or do anything else to affect test results. Care must be taken to assure that any attachment hardware added to the vehicle is not in the vicinity of the fuel tank or lines.

27. Record the vehicle weight at each wheel to determine the actual test weight.

| Weight of Ballast: | 45.4 kg |

| Right Front (kg): | 547.9 | Right Rear (kg): | 465.4 |
| Left Front (kg): | 531.2 | Left Rear (kg): | 484.4 |

(% GVW = Axle GVW divided by Vehicle GVW)

28. Is the test weight between the Max. Weight and the Min. Weight (See 20.2)?
   X Yes
   X No, explain why not.

29. Test Weight Vehicle Attitude: (all dimensions in millimeters)

30. Perform the following steps until either all steps are completed, or the foot contacts the accelerator pedal. Step 30.5 shall be completed in all cases.

30.1 Extend the leg until the foot contacts the pedal. Do not raise the toe of the foot higher than the top of the accelerator pedal. If the foot does not contact the pedal, proceed to the next step. If pedal contact does occur, place a tapered foam block as shown in Figure G1 under the heel with the shallow part of the taper facing forward. (S16.3.2.2.1(b) & S16.3.2.2.3)

30.2 If the vehicle has an adjustable accelerator pedal, move the pedals rearward until pedal contact occurs or the pedals reach the full rearward position. If pedal contact does occur, place a tapered foam block as shown in Figure G1 under the heel with the shallow part of the taper facing forward. (S16.3.2.2.1(b) & S16.3.2.2.3)

N/A No pedal adjustment

30.3 Angle the foot to achieve contact between the foot and the pedal. If the foot does not contact the pedal, return the foot to the perpendicular orientation. If pedal contact does occur, place a tapered foam block as shown in Figure G1 under the heel with the shallow part of the taper facing forward. (S16.3.2.2.2 & S16.3.2.2.3)

30.4 Align the centerline of the foot in the same horizontal plane as the centerline of the accelerator pedal. Place a tapered foam block as shown in Figure G1 under the heel with the shallow part of the taper facing forward. (S16.3.2.2.3)
30.5 Record foot position
   __Pedal Contact achieved. Contact occurred at step ________.
   __Heel set _____ mm from floor pan.
   __Pedal Contact not achieved. Heel set _____ mm from the floor pan.

31. Driver’s foot positioning, left foot.

   31.1 Place the foot perpendicular to the leg and determine if the heel contacts the floor pan at
   any leg position. If the heel contacts the floor pan proceed to step 31.2, otherwise
   position the leg as perpendicular to the thigh as possible with the foot parallel to the floor
   pan. (S16.2.2.6)

   31.2 Place the foot on the toe board with the heel resting on the floor pan as close to the
   intersection of the floor pan and the toe board as possible. Adjust the angle of the foot if
   necessary to contact the toe board. If the foot will not contact the toe board, set the foot
   perpendicular to the leg, and set the heel on the floor pan as far forward as possible.
   Avoid contact with the brake pedal, clutch pedal, wheel well projection, and footrest. To
   avoid this contact use the following three manipulations in the order listed, with each
   subsequent option incorporating the previous, until contact is avoided: rotate the foot
   about the lower leg (abduction/adduction), plantar flex the foot, rotate the leg outboard
   about the hip. Movement should be the minimum amount necessary. If it is not possible
   to avoid all foot contact, give priority to avoiding brake or clutch pedal contact.
   (S16.2.2.4 & S16.2.2.5 & S16.2.2.7)

      X  No contact
      __ Foot rotated about the leg (abduction/adduction)
      __ Foot rotated about the leg, and foot plantar flexed
      __ Foot rotated about the leg, foot plantar flexed, and the leg rotated about the
         hip.

   31.3 Record foot position.
      __ Heel does not contact floor pan.
      __ Heel on floor pan and foot on toe board.
      X  Heel on floor pan and foot not on toe board.

32. Driver arm/hand positioning.

   32.1 Place the dummy’s upper arms adjacent to the torso with the arm centerlines as close to
   a vertical longitudinal plane as possible. (S16.3.2.3.1)

   32.2 Place the palms of the dummy in contact with the outer part of the steering wheel rim at
   its horizontal centerline with the thumbs over the steering wheel rim. (S16.3.2.3.2)

   32.3 If it is not possible to position the thumbs inside the steering wheel rim at its horizontal
   centerline, then position them above and as close to the horizontal centerline of the
   steering wheel rim as possible. (S16.3.2.3.3)

   32.4 Lightly tape the hands to the steering wheel rim so that if the hand of the test dummy is
   pushed upward by a force of not less than 9 N (2 lb) and not more than 22 N (5 lb), the
   tape releases the hand from the steering wheel rim. S16.3.2.3.4

33. Adjustable head restraints
   __ N/A, there is no head restraint adjustment
33.1 If the head restraint has an automatic adjustment, leave it where the system positions the restraint after the dummy is placed in the seat. (S16.3.4.1) Go to 34.

33.2 Adjust each head restraint vertically so that the mid-horizontal plane determined in Data Sheet 14.1 is aligned with the center of gravity (CG) of the dummy head. (S16.3.4.3)

X 33.3 If the above position is not attainable, move the vertical center of the head restraint to the closest detent below the center of the head CG. (S16.3.4.3)
   _N/A midpoint position attained in previous step
   X Headrest set at nearest detent below the head CG

33.4 If the head restraint has a fore and aft adjustment, place the restraint in the foremost position or until contact with the head is made, whichever occurs first. (S16.3.4.4)

34. Driver and passenger manual belt adjustment (for tests conducted with a belted dummy). (S16.3.5) UNBELTED TEST

34.1 If an adjustable seat belt D-ring anchorage exists, place it in the manufacturer’s design position for a 5th percentile adult female. (S16.3.5.1) This information will be supplied by the COTR.
   Manufacturer’s specified position ________________________________
   Actual Position________________________________________________

34.2 Place the Type 2 manual belt around the test dummy and fasten the latch. (S16.3.5.2)

34.3 Ensure that the dummy’s head remains as level as possible. (S16.3.5.3)

34.4 Remove all slack from the lap belt. Pull the upper torso webbing out of the retractor and allow it to retract; repeat this operation four times. Apply a 9 N (2 lbf) to 18 N (4 lbf) tension load to the lap belt. If the belt system is equipped with a tension-relieving device, introduce the maximum amount of slack into the upper torso belt that is recommended by the manufacturer. If the belt system is not equipped with a tension-relieving device, allow the excess webbing in the shoulder belt to be retracted by the retractive force of the retractor. (S16.3.5.4)

The passenger seat adjustments are controlled by the adjustments made to the driver’s seat. Therefore, positioning of the passenger dummy is made simultaneously with the driver dummy. Adjustments made to the seat to position the driver will over ride any adjustments that would normally be made to position the passenger. (S16.2.10.3)

1. Place the SCRP in the full rearward, mid-height position, and mid-seat cushion angle, determined during the completion of Data Sheet 14.1. (S16.3.3.1.1)

2. Fully recline the seat back. (S16.3.3.1.2)
   - N/A seat back not adjustable.

3. Place the dummy in the seat with the legs at an angle of 120 degrees to the thighs. The calves should not be touching the seat cushion. (S16.3.3.1.2)

4. Position the dummy in the seat such that the midsagittal plane is coincident with the longitudinal seat cushion marking that was determined in Data Sheet 14.1. (S16.3.3.1.3 and S16.3.3.1.4)

5. Hold down the dummy’s thighs and push rearward on the upper torso to maximize the pelvic angle. (S16.3.3.1.5)

6. Set the angle between the legs and the thighs to 120 degrees. (S16.3.3.1.6)

7. Set the transverse distance between the centers of the front of the knees at 160 to 170 mm. (6.3 to 6.7 inches). Center the knee separation with respect to the longitudinal seat cushion marking that was determined Data Sheet 14.1. (S16.3.3.1.6)
   - Record Knee Separation 165

8. Push rearward on the dummy’s knees until the pelvis contacts the seat back, or the backs of the calves contact the seat cushion, whichever occurs first. (S16.3.3.1.6)
   - Pelvis contacted seat back.
   - Calves contacted seat cushion.

9. Gently rock the upper torso ± 5 degrees (approximately 51 mm (2 inches)) side-to-side three times. (S16.3.3.1.7)
10. If needed, extend the legs until the feet do not contact the floor pan. The thighs should be resting on the seat cushion. (S16.3.3.1.8)

11. Use seat controls to line up the seat markings determined during the completion of Data Sheet 14.1 to set the foremost fore-aft position, mid-height position and the seat cushion mid-angle. If the dummy contacts the interior move the seat rearward until a maximum clearance of 5 mm (0.2 inches) is achieved or the seat is in the closest detent position that does not cause dummy contact. (S16.3.3.1.8)

__ Dummy contact. Clearance set at maximum of 5mm

Measured Clearance ____________

__ Dummy Contact. Seat set at nearest detent position.

12. If the seat back is adjustable, rotate the seat back forward while holding the thighs in place. Continue rotating the seat back forward until the transverse instrument platform of the dummy head is level ± 0.5 degrees. If head cannot be leveled using the seat back adjustment, or the seat back is not adjustable, use the lower neck bracket adjustment to level the head. If a level position cannot be achieved, adjust the head as closely as possible to the ± 0.5 degree range. (S16.3.3.1.9 and S16.3.3.1.10)

16. Measure and set the pelvic angle using the pelvic angle gage TE-2504. The pelvic angle should be 20.0 degrees ± 2.5 degrees. If the pelvic angle cannot be set to the specified range because the head will not be level or because the dummy will have need major repositioning, adjust the pelvis as closely as possible to the angle range, but keep the head level.

TEST SPEED: X 32 to 40 kmph _ 0 to 48 kmph _ 0 to 56 kmph
DRIVER DUMMY: X 5th female __ 50th male
PASSENGER DUMMY: X 5th female __ 50th male

1. Pre-Crash
   1.1 Describe from visual inspection how the windshield is mounted and describe any trim material.

   Retained with glue
   Plastic trim

   1.2 Mark the longitudinal centerline of the windshield

   1.3 Measure pre-crash A, B, and C for the left side and record in the chart below.

   1.4 Measure pre-crash C, D, and E for the right side and record in the chart below.

   1.5 Measure from the edge of the retainer or molding to the edge of the windshield.
   Dimension G (mm): 4 mm

2. Post Crash
   2.1 Can a single thickness of copier type paper (as small a piece as necessary) slide between the windshield and the vehicle body?

   No - Pass. Skip to the table of measurements, complete it by repeating the pre-crash measurements in the post crash column, and calculate the retention percentage, which will be 100%.

   Yes, go to 2.2

   2.2 Visibly mark the beginning and end of the portions of the periphery where the paper slides between the windshield and the vehicle body.

   2.3 Measure and record post-crash A, B, C, D, E, and F such that the measurements do not include any of the parts of the windshield where the paper slides between the windshield and the vehicle body.

   2.4 Calculate and record the percent retention for the right and left side of the windshield.

   2.5 Is total right side percent retention less than 75%?

   Yes, Fail
   No, Pass

   2.6 Is total left side percent retention less than 75%?

   Yes, Fail
   No, Pass

1. Place a 165 mm diameter rigid sphere, with a mass of 6.8 kg on the instrument panel so that it is simultaneously touching the instrument panel and the windshield. (571.219 S6.1(a))

2. Roll the sphere from one side of the windshield to the other while marking on the windshield where the sphere contacts the windshield. (571.219 S6.1(b))

3. From the outermost contactable points on the windshield draw a horizontal line to the edges of the windshield. (571.219 S6.1(b))

4. Draw a line on the inner surface of the windshield that is 13 mm below the line determined in items 2 and 3.

5. After the crash test, record any points where a part of the exterior of the vehicle has marked, penetrated, or broken the windshield.

Provide all dimensions necessary to reproduce the protected area.
