New Version of Truck Configurator for Italscania from Lomtec

Lomtec has completed works on a new version of the configurator of cargo trucks for Italscania named Italscania Truck Configurator 2.0 (ITC 2.0).

([PRWEB](#)) July 14, 2005 -- Lomtec has completed works on a new version of the configurator of cargo trucks for Italscania named Italscania Truck Configurator 2.0 (ITC 2.0).

It concerns a desktop JAVAapplication, with the understanding that the Lomtec ActiveOffice solution has been used as the Administration Intranet. ITC 2.0 follows from the first version of the configurator completed already in 2003.

Truck Configurator relieves sellers of a laborious handling of a price list and allows them to promptly create (configure) a cargo truck at a given moment precisely according to customerÂs requirements. This means that the customer ÂconstructsÂ its own cargo truck with the seller in real time. It starts by a selection of a specific model, enters a type of the engine, chassis, size of wheels, type and accessories of the cab, etc. The application allows an immediate printing of the configured set in the form of an offer, together with other documents necessary for an implementation of the order. It is possible to store and repeatedly retrieve any orders created, create leasing calculations and budgets of the service support. When compared to version 1.0, the application has also been harmonized with the ItalScanie central ordering system.

Already now, version 3.0 is being considered, which would, of course, respond to responses and specific experience of users in version 2.0. At the same time, the possibility to create an ITC version for the use on handheld computers (PDA) is being discussed, which would mean another quality progress in wok of ItalScanie sellers.
